## *sound motion picture takes the mystery out of electronics*

Electronics is so much a part of everyday living, that a broad understanding of its basic facts is highly important. Electronics is at work all around us. It is the basis of the radio, of the “electric eye”, of x-ray devices. Electronic devices perform hundreds of tasks in industry.

In the new sound motion picture “Electronics at Work,” electronics is taken out of the realm of magic or of abstruse science, and is shown as an easily-understood tool, employed in a thousand useful ways.

With animated diagrams and simple description, this film explains the principles of the electronic tube and shows its six basic functions. Striking photography in factories shows what various tubes do in industry and how they do it.

“Electronics at Work” will be of value to all high school students. It is loaned free to schools, runs 20 minutes, and is available on either 16 mm or 35 mm film.

## Training for War—and Peace!

Visual education techniques have helped train millions for war in less time. This vast program of mass military training has valuable lessons for our schools which will definitely aid in making teaching more effective! ★ The war program has helped Ampro engineers produce even more efficient 16mm. projectors. Today Ampro units are going 100% into the war effort. Soon—these improved Ampro projectors will be available for peacetime education. Write for latest Ampro Catalog of 8mm, silent and 16mm. silent and sound projectors.

Anti-Aircraft Gun Crew — Official U.S. Navy Photograph

## “Fire when ready!”

Dramatic seconds pass while the enemy plane approaches. It must be brought down or a U. S. ship may sink below the waves. Accurate marksmanship literally becomes a life-or-death matter. And accuracy depends on many factors—chief among them being the gunsights such as supplied by Spencer.

The Navy and Army have entrusted the manufacture of some of the most intricate optical devices to Spencer because of a long record of success in producing scientific optical instruments of great precision.

In addition to thousands of standard microscopes and other instruments being

made for the armed services and war industries, Spencer's production includes periscopes, telescopes, aircraft gunsights, prism binoculars, azimuth instruments for directing artillery fire, tank sights, and telescopic alidades for navigation.

*Optical instruments are so vital to war and public health that the nation's needs absorb practically all of Spencer's greatly increased production.*

## Audio-Visual Aids in the Schools of Tomorrow

**Brief Resume of the possibilities, problems and dangers that will confront the post-war visual field.**

**ALVIN B. ROBERTS**, Principal  
Haw Creek Township High School, Gilson, Ill.

SINCE Pearl Harbor every branch of the armed services has stepped up its training program through the use of audio-visual aids. The time required to develop a certain degree of skill has, in many instances, been materially reduced by using specially prepared audio-visual aids. The number of commissions offered and granted to men experienced in the preparation and use of these aids is indicative of the importance given to this type of education by government officials. If one looks back to the dark days following the attack on Pearl Harbor he can readily see and appreciate how far on the road to victory his country has come, and take pride in the progress of different branches of the service in every theatre of the war. Specifically, the armed forces of The United Nations would not now be on the offensive, but for the marvelous production record of the United States. Audio-visual aids were and are being used to speed up that production in numerous branches of industry. Again, motion picture film is used to acquaint our allies with methods of assembling American-made products. Hence, when the material arrives on foreign shores the assembling crew is ready to go to work. Such instances could be multiplied almost indefinitely.

As a result of this extensive use of audio-visual aids by the armed services and by industry, many

Four scenes from "Eighteenth Century Life in Williamsburg," Eastman classroom film.

educators are predicting "Audio-Visual Aids will be used more than ever before as a regular part of the educational program in schools of tomorrow." What are the factors that seem to point to this conclusion? They are:

1. Many instructors who have been in the service and trained by audio-visual aids, will return to the classroom bringing with them a desire to use these aids in their own teaching procedure.
2. Parents, who have been in the service or in industry, and have been instructed by these new aids, will urge their more extensive use in the schools.
3. Projectors may be available (from the government) at prices that will come within the budget of the smallest schools. In addition producers are promising new and superior equipment after the war at prices below those of prewar days.
4. Film producers will have had considerable experience in techniques of preparing films for a specific teaching purpose.
5. Sale and rental prices of slides and films will probably be reduced considerably after the war, as a result of experience gained during

the war and by the increased demand for films and slides for educational purposes.

6. More films will be available for instructional purposes after the war, especially in the fields of social science, various fields of vocational training, and physical education.
7. Many valuable books and articles have been prepared which are and will be of great help in setting up the visual program, such as:

*Selected Educational Motion Pictures*, prepared by the Committee on Motion Pictures in Education and published by American Council on Education, Washington, D. C. 1942. An excellent book in that it gives not only description of films, but suggestions concerning their use as well.

*Selected Films for American History*, by W. H. Hartley, Bureau of Publications, Teachers College, Columbia University, 1940. A helpful book to the American History teacher because all films listed may be used in an American History class. Consequently the teacher's job in seeking film material is greatly simplified.

*Teacher Education through Films*, by William H. Hartley, Educational Administration and Supervision, 29:168-76, March 1943. A brief discussion of the values in the use of motion pictures to illustrate to teachers in training various methods of classroom procedures, how pictures should be selected, presented and studied, and methods of securing suitable films. Concludes with a suggested list of films, by subject.

In view of all of these factors one may justly feel that at last visual education is coming into its own, and that in the years to come audio-visual aids will be a normal part of classroom equipment. However, much remains to be done before this goal can be achieved. Even before our entrance into the war we were talking of winning the peace. So if the schools are to have this expanded program of audio-visual instruction, plans should be formulated and carefully considered now.

What are some of the problems that must be considered, if this goal is to become a reality? Some of the more important are:

1. *Providing trained directors* to administer and supervise the audio-visual program. With the exception of a few who will have acquired this training in some branch of the service, very little is being done to provide adequate training in this field. As long as it

From "City Planning," a Gutlohn film, which visualizes the city of the future.

is necessary to depend upon some or several outside sources for many of the best audio-visual aids the success of any program will depend to a certain degree upon the director of this program. He is not only needed to secure materials but to provide educational leadership in coordinating the whole audio-visual program. To meet this need teacher training institutions should prepare to train students as competent directors.

2. *Give the director* a place on the Curriculum Committee. The experienced director should be able to suggest means of enriching the curriculum as well as attaining the established goals.

3. *Training teachers* is still one of the major problems retarding the audio-visual program. The teacher of today who is not interested in using visual aids is not going to be interested in using them after the war, unless some training is provided.

Teacher training institutions should offer more courses, and should offer these courses during the regular term as well as in the summer session. Extension and workshop courses should be made a part of the in-service training program.

Audio-visual Directors should be able to carry on a training program for their own teachers through adequate demonstration and supervision. This training program should be broad enough to acquaint the teacher with the scope and function of the various aids, as well as to provide training in the operation of machines.

4. *Producing films for classroom use* will be one of the major problems after the war. When a training film for some branch of the service is to be produced the objectives are definite. Can teachers set up definite objectives and give help in planning films that will attain these objectives in educational fields? Many excellent films are now available in science and in several vocational fields. In some areas few films are available. In the field of social science such films as "Kentucky Pioneer," "The Flatboatmen" (Erpi) "Give Me Liberty," "Old Hickory" (Warner Bros.) and "Eighteenth Century Life in Williamsburg, Virginia" (Eastman) are examples of films well suited

(Concluded on page 18)

Early settlers of the Ohio Valley—from the Erpi instructional film, "Flatboatmen of the Frontier."

# Audio-Visual Aids -- A Survey

## Observations of current practices in Visual Education Departments

MARY LOUISE MOLYNEAUX

Supervisor of Elementary Education  
Public Schools, Pittsburgh, Pa.

Of the twelve school systems visited, eleven have Departments of Visual Aids. Eight of these departments have directors<sup>1</sup> whose duty it is to administer only that department. In three systems the person in charge has additional responsibilities: in Cleveland Heights his duties are combined with curriculum, in Providence with nature study, and in Newark with library.

Scarsdale has no department of visual aids. A committee of teachers is responsible for the selection of materials and the discussion of common problems. The chairman of this committee is also a teacher. Each school has a visual aids chairman who assists the teachers in the building in the selection and use of materials.

### Organization and Administration

The directors are staff officers. The department personnel generally consists of an educational assistant<sup>2</sup>, a secretary, booking clerks, order and filing clerks, mechanics, film inspectors, delivery truck drivers and helpers. In smaller systems some of these duties are combined. Where a mechanic is not employed, machines are sent out for repair. At the present time this is not entirely satisfactory as the return of the equipment is generally delayed.

The services rendered by the departments include selection, purchase, rental, maintenance, distribution and use of materials and equipment. In some systems it includes the preparation of exhibits, slides, films, photographs, and recordings.

Most systems have been affected by the loss of personnel due to war conditions. Positions are being filled by women and high school boys and girls. The women are doing any or all of the above named types of work except the repair of machines. High school boys are doing booking and filing, packing materials, and loading trucks. High school girls are working as booking and filing clerks, and typists. All students work on a part time basis during or after school hours and are paid about \$.35 per hour.

Delivery in most schools is made by Board trucks. Because of tire and gas shortage, deliveries have been curtailed slightly in some places. In the various systems they are made daily, four times weekly, three times weekly, twice weekly, or weekly. In New York City the department film storage has been decentralized into districts for greater proximity to the schools.

1. *Director* is used to signify the person in charge of the department. The term *Supervisor* or *Secretary* is used in some systems.

2. Detroit, Cleveland, Newark, Philadelphia, Boston.

### Visual Equipment

The equipment found most generally in the schools is the 3¼" x 4" slide machine and the 16 mm. silent projector. The 16mm. sound projectors are being used in most junior and senior high schools, but are a part of the permanent equipment in a very small proportion of the elementary schools. The 35 mm. sound machines have been placed in some high schools, and are operated by licensed faculty members.

The other types of equipment vary. Combination 2" x 2" slide and film strip projectors have been added to the high school equipment in many systems. Some schools have opaque projectors.

Equipment housed permanently in the school is purchased by the visual department, the school, or a community organization such as the Parent-Teacher Association. When equipment is purchased by other than the department, most directors prefer to designate the type most desirable so that it will be standard. All equipment is maintained and serviced by the department after its purchase.

### Utilization of Equipment

Visual equipment is used in the classroom, projection room, and auditorium. Although a slide machine may be used in any room with an electrical outlet, motion picture projection requires a screen and dark shades for good results. As only a small proportion of the classrooms are so equipped, films are generally shown in projection room or auditorium. Sound projectors are a part of the auditorium equipment, and are seldom used in the classroom.

Teachers are taught to operate equipment by

This is a report of a trip made through the generosity of the H. C. Frick Educational Commission by Miss Louise Molyneaux, Supervisor of Elementary Education. It covers a period of four weeks, in the spring of 1943, during which twelve representative cities, large and small, east of the Mississippi and North of the Ohio, were visited.

The school systems covered were Cincinnati, Cleveland, Cleveland Heights (Ohio); Boston, (Mass.); Providence (R.I.); New York City, Scarsdale, Rochester (N. Y.); Newark, Montclair (N. J.); Detroit (Mich.); Philadelphia, (Pa.).

I would like to express my own personal appreciation to the many persons in each of the twelve school systems visited who extended so many personal and professional courtesies to Miss Molyneaux and enabled her to bring back to the Pittsburgh Public Schools many ideas which, with proper adaptations for Pittsburgh, will be put into effect gradually through the coming years.

HENRY H. HILL  
Superintendent of Schools  
Pittsburgh, Pennsylvania

Above: Children study a model from the prehistoric exhibit of the Children's Museum in Detroit.

Left: A bulletin board from the Museum on the history of Detroit is a background for the dramatization of an early school.

skilled operators or mechanics sent from the visual department, or by teacher operators within the building. Teacher projectionists are the most desirable, but because all are not trained, principals and itinerant or student projectionists<sup>3</sup> go from school to school on call to show films ordered by the teachers. Student projectionists are found to be highly satisfactory in most high school situations when the teacher in charge sets and maintains high standards of operation and care of equipment. These boys and girls are put through a thorough training, then are assigned as operators during study periods. New operators are assigned as apprentices to good experienced operators. Those assigned to a job deliver equipment and films, clean, set up, and run the projector, then return it to the storeroom or next assigned classroom. A few directors reported good student projectionists in the elementary school although in most cases the machines are operated by adults.

#### Visual Materials

Visual materials most commonly distributed by the department are 16mm. silent films and  $3\frac{1}{4}$ " x 4" slides. The number of 16mm. sound films is increasing, although fewer in number than silent films. Some departments distribute habitat group cases, dioramas, exhibits, maps, charts, and flat pictures of natural history and social study subjects. In other systems this service is supplemented or replaced by city museum service. Much of the school owned material was prepared through the W.P.A. Art Projects. The number of filmstrips and 2" x 2" slides is increasing.

Cleveland Heights is making excellent use of 2" x 2" slides photographed by the teachers. The subjects are largely of a local nature and tie in very well with such curricula as bird and insect study, and geology. A teacher who turns in 18 frames of 2" x 2" pictures is given a roll of 35mm. film.

3. Three systems have such operators.

Most departments circulate musical and speech recordings. These have been purchased or made by the school. Radio scripts of school broadcasts are put into circulation in some systems using radio. Boston and Montclair circulate science experiment material cases for use in performing simple experiments in elementary science.

Most school systems have made some school-made motion pictures for public relation purposes, but Cleveland Heights probably has done more than most schools in this field. The films are made by the head of the department in consultation with the supervisor concerned. Some are teaching films, others are primarily for public relations. They are widely used within the schools and community, and are considered effective aids.

Most departments own most of the material used in the schools. Some is obtained on long term loan from state departments, bureaus, and government agencies such as the O.W.I. A few departments rent most of their film materials on the grounds that this prevents depreciation or obsolescence of that material in their departments, and the newest is always available. Other systems rent no material on the grounds that if it is good enough to rent, it is good enough to buy.

Opinion on the acceptance and use of commercial films by the schools is divided. Generally, the attitude is that the material produced recently is of greater educational value than in the past, and the advertising element is being reduced to a minimum. Under such conditions, it is being accepted for use by many schools. Others use none at all.

#### Integration of Visual Materials into the Curriculum

Directors are attempting to aid teachers in the selection of the visual materials that will best assist or supplement the teaching of classroom units of work. Two methods are most common. One is the selection of new materials in cooperation with the directors or supervisors of the departments con-

cerned. In some instances, the director concerned calls in a committee of his teachers to preview the material and make the selection. The second device is to list in the unit of work in the course of study the visual aids that are suitable for that unit.

Other devices are used also. Some visual aid catalogues are listing films under school subject headings so the teacher of each subject may find quickly the materials suitable to his subject. The sound film catalogue of the Philadelphia schools in describing the films suggests ways in which some of them may be used effectively. It suggests also whether it is best adapted to elementary, junior, or senior high school. Several other systems follow this latter practice. Cleveland Heights has indicated in its catalogue of visual aids a correlation of  $3\frac{1}{4}'' \times 4''$  and  $2'' \times 2''$  lantern slide sets with the course of study according to subject, grade, and unit. Montclair is preparing its catalogue in terms of units of work in various subjects, and lists all available visual aids for that unit regardless of the type of aid.

In Newark a trained teacher and librarian is located full time in the visual department to act as a consultant for teachers and principals. She gives advice on the best materials available for the desired purpose. A teacher on the substitute list works full time selecting slides suitable for the grade and unit desired by the teacher as the individual orders are received.

The most specific integration into the curriculum is in Providence, R. I., where films are grouped in primary, elementary, junior and senior high school classifications, and then are allocated to the units of work to which they are best suited. Each school is offered a group of films at a cer-

tain time. The teacher selects which films she wishes, and is sure that they will be available for her at that time.

Some directors are members of all course of study committees. Some others are provided with drafts of the course of study as it is formulated so that suggestions for visual aids can be included.

#### Use of Films for Entertainment Purposes

The use of instructional films for entertainment purposes is discouraged. Although it is agreed that at times entertainment film have a place, many directors feel that some teachers still are showing instructional films with the entertainment approach.

Four school systems are operating a regular high school lunch period recreational program for those students who wish to attend. In two of the four systems two cents a day is charged. In a third system the children voluntarily pay one cent a day as they leave the auditorium. The fourth system provides O.W.I., commercial, and free films exclusively as it does not permit rentals. In most cases any school desiring such a program must order and pay for all films used. Lunch period programs are looked upon with disfavor in most systems for the following reasons:

1. Rental material is too costly.
2. Not enough good free material is available to continue such a program indefinitely.
3. As lunch periods are short, children rush through their lunch too quickly so as to get to the program on time.
4. Student tastes are lowered by the type of recreational material that is available to schools.
5. Fresh air and sunshine are more helpful than a dark auditorium. This, of course, is in sections where enough ground surrounds the school to make it advisable for the children to go outdoors.

#### In-Service Training in the Use of Visual Materials

The greater percentage of teachers today had finished normal school or college before visual aid courses were given. Many directors stated that a number of teachers have taken such courses in

(Photos by Mrs. Ray Garner)

The Brooklyn Children's Museum provides study materials for elementary pupils.

Assembling lantern slides for elementary schools,  
at Cleveland Educational Museum.

recent years—some of which were taught by the directors themselves.

Some systems are attempting to aid the teacher in making more effective use of materials. The visual education director of the Montclair Schools is particularly conscious of this problem, and spends much time counselling with teachers individually concerning the use of materials. Demonstration lessons and meetings of teachers to discuss materials and their uses were reported by several others, but seemed more incidental than part of a planned program. The curriculum centers in Cleveland offer an excellent opportunity for teachers to see visual materials used in relation to their particular subject or grade, and provide an opportunity for experimentation in the use of materials. Cleveland also has developed the use of slides in connection with radio lessons. This illustrates to the classroom teacher certain techniques in the use of slides. Cleveland and New York City make available for service in the schools a regular classroom teacher who possesses an interest and ability in using visual materials. She aids the teacher in using materials effectively. Both systems report it as highly successful. Cincinnati encourages teacher planning and becoming acquainted with the film content and its use by sending the producer's teacher's guide for the film three days before the film delivery date. This is possible because of a daily delivery system.

#### Public Museum Service to the Schools

Most school systems have a cooperative arrangement with the public museums or have a children's museum operating as a part of the school system. Most public museums have a school or junior department that cooperates with the schools by preparing and distributing museum materials, by receiving classes at the museum for instruction, and by setting aside certain rooms as junior rooms where children may come after school hours and on Saturday to participate in club activities, to

view or study exhibits prepared especially for them, or to take part in voluntary instructional classes.

In Cleveland the program set up by the Museum of Natural History seems particularly effective. It is conducted by a teacher from the Cleveland Schools who arranges each semester a series of lesson suggestions that are integrated with the science course of study of the schools. Teachers indicate when they wish to come and which of the lesson suggestions they prefer.

The Children's Museum in Detroit is a part of the school system. Its various rooms have exhibits which attempt to convey to the children a central idea in art, social studies, natural science, etc. The museum is responsible, also, for preparing for use in the schools materials that will fit into the school program. This is done usually in cooperation with the directors of the departments concerned.

Curtailed transportation has seriously restricted class visits to the museums. However, several places have devised ways of overcoming this difficulty to a certain extent. Some museum teachers are on call to go to the schools with such materials as may be easily transported.

The Brooklyn Children's Museum is confining its class visits very largely to the schools within walking distance. A plan of work is decided upon by the museum and the school, and the group comes on the average of once a week over a period of time. This is showing signs of being quite satisfactory.

The materials prepared by the museums for circulation to the schools are historical dioramas, flat pictures, copies of famous paintings, natural history habitat groups, nationality dolls, and small packing boxes of types of clothing, pottery, weaving, utensils, toys, etc., of early peoples or children of other lands. Several have interesting dioramas and exhibits of local historical significance.

#### Radio in the Schools

Three systems<sup>4</sup> have developed extensively the classroom use of radio. Most of the others are using it in a limited way for public relations broadcasts and the reception of network educational programs in the schools. Cleveland has a full time director and operates its own station which is on the air the entire school day. The Detroit program is under the direction of the director of visual education, but is operated by a specially trained staff. Local stations give regular time each day for school broadcasts. Rochester also is given time by the local stations, and broadcasts are under the direction of the director of visual education. Programs are prepared by the directors of the different fields and a teacher, who at present is spending full time in the observation of classes and preparation of elementary science broadcasts.

The principle upon which these programs are presented is that broadcasts by school people are prepared in the subject areas desired, are written especially to fit the local school situation, are re-

4. Cleveland, Detroit, Rochester

ceived more nearly at a suitable time, and may act as an in-service training device for teachers. Listening is voluntary and no class should receive more than approximately two programs a week. The programs may be tied into the course of study, supplementary to it, or of a general interest. They may be of the lesson type, dramatic presentations,

talks, discussions, or stories. Radio staff, department directors, teachers, students, and occasionally laymen participate. Teacher's guides usually are sent to the schools before the broadcast day suggesting activities to precede and follow the broadcast.

(To be concluded in February)

## Visual Education in Classes Containing White and Negro Pupils

**D**OING a good job of teaching the Social Sciences is none too easy under the best conditions. Dealing as they do with human nature, these sciences demand the finest work from the teacher and the best that can be afforded in equipment to help the student gain understanding in these areas of knowledge.

The modern Social Science teacher does not, of course, pass by the opportunity of using any teaching aids that will make daily lessons more clear. Of all such aids available today, perhaps none surpass visual or radio equipment so far as the Social Sciences are concerned. Nothing except actual, personal contact with the problem will teach this subject so efficiently as the modern motion picture accompanied by sound. Here the student *sees* and *hears* the living problem. Stated so simply, the method seems quite free from complications.

The writer has been teaching in a secondary school in which there is an average Negro population of eight to ten per cent. The teacher who has never been confronted with such a situation might not see any particular difficulties in using classroom films in such a school. And yet, there are dangers present in many films that serve to aggravate the problem of the colored student in school instead of helping to ease it. An example of a film for history classes, presented by a state department of education, illustrates this point.

The particular film referred to was produced to illustrate the condition of the ante-bellum South. Midway in the film are shown slave quarters of that period and then intimate glimpses of slaves in their everyday lives. In their leisure hours, slaves are seen dancing like jitter bugs, an "old mammy" is smoking a corncob pipe while clapping enthusiastically in time to the music and little children are dancing with might and main in their stocking feet. Need there be any comment on the effect of these scenes on Negro students? One might even go so far as to ask: What value is there in such a picture for white students in a day when the leaders of our country are trying to teach racial tolerance for the benefit of our Negro citizens? This film, instead of furthering the ideals of democracy, actually causes ill feeling on the part of both colored and white pupils in the class. The Negroes resent the pictures and the white students have a tendency toward that adolescent sadism in which secondary pupils often indulge.

**EDWIN A. FENSCH**

School Psychologist  
Public Schools, Mansfield, Ohio

Classes that include Negro students require care and judgment in the selection of films for classroom use. Unless the Negroes in the school come from such a high social and economic class that they are not bothered by racial intolerance to a marked degree, several precautions must be observed in the selection of films for teaching purposes.

First of all, the film must not depict Negroes in a derogatory manner. The history film mentioned above portrays adult Negroes and their children acting like a bunch of happy morons; this results in a negative reaction by the colored pupil in the class. Second, Negro students object to Negro dialect customarily associated with the colored race. While engaged in a research problem<sup>1</sup> the writer interviewed Negro students and adults and discovered that colored children object to Negro dialect even when performing before their own race. They feel that this is a reflection on their intelligence. Third, colored students especially resent the movie, radio play or story that presents the Negro as a comical, ignorant or shiftless character. Wit is one thing; buffoonery another. The latter stirs up resentment among colored pupils. Similar reactions occur when the colored person is so treated in poetry, cartoons and the like. This, like the first example, produces an antagonistic response.

Since our country is fighting its greatest struggle in its history to preserve our democracy, we must be consistent with our stated beliefs. We must give our Negro citizens and their children the respect and the opportunities for participation that our laws apportion to them. It follows, then, that we must be careful to teach and practice tolerance. Films that violate such principles as stated above will defeat these aims and therefore have no place in our classrooms. The teacher selecting visual aids must bear these warnings in mind and be careful that such offerings are not included in the visual program of his classes.

# Post-War Visual Education Potentialities In Latin America

NATHAN D. GOLDEN

Chief, Motion Picture Unit, Bureau of  
Foreign and Domestic Commerce, Washington, D. C.

Concluding (from the December issue) the summary of the status of visual aids in each Latin American country, with some forecasts as to probable future developments.

An audience of South American school children at a screening of some CIAA health films.

**El Salvador**—The Ministry of Public Education has an educational film department which has charge of showings in all public schools, and also produces a few films. Seven schools use films for teaching and four maintain film libraries. Eight silent and one sound 16mm projectors are in use, but no 35mm. Slide-films are used by schools to a slight extent, but very few schools maintain slide-film libraries. This market is very small but will probably increase slowly during the next few years.

**Guatemala**—Although the Guatemalan Government has issued regulations lowering the duties on educational films, little has been done with visual instruction in schools and colleges. Lack of funds again. There seems to be little opportunity for development here. Only two schools are known to have motion picture projectors, and these are used principally for entertainment. The local Coordinator of Inter-American Affairs has two portable 16mm projectors with sound equipment and makes regular showings of educational films at all the schools. These showings have received many favorable comments from the authorities, press, and audiences.

According to local dealers in photographic supplies and equipment, approximately seventy-two 16mm silent projectors have been sold here in the last ten years, and many of these are old models and not in use. All purchases have been made by individuals, and the market for this line is very limited. The market for 8mm silent equipment appears to be better, since more people can afford the lower price.

**Haiti**—Educational institutions in Haiti are but slightly interested in the use of films. The Medical School in Port-au-Prince and Agricultural School at Damien are the only educational institutions using films at present. They have 16mm sound and silent projectors, but limited budgetary allowance prevents establishment of a library. United States Government films are borrowed from time to time and are very well received.

**Honduras**—The only commercial film known to be shown in Honduras are those exhibited by Sterling Products, International. This firm uses mobile equipment which travels constantly throughout the Republic, giving exhibitions in many places where there are no regular movies. There have been no developments within the country along the lines of educational motion pictures, and none are distributed in the schools. The Coordination Committee for Honduras in cooperation with the Legation puts on shows three times weekly in Tegucigalpa using films furnished by the Coordinator of Inter-American Affairs. Most of these are of an educational nature.

**Mexico**—There is no production of educational or commercial films in Mexico. However, a certain number of educational films have been brought in by various industries operating in Mexico and a limited number have been distributed through the American Embassy by the Office of the Coordinator of Inter-American Affairs. For the most part, the educational films are 16mm films and are usually not shown in the regular motion picture theaters, but are rather shown in clubs and recreation halls, as

well as by sound trucks traveling through the country. Thus far the number has been very small but there appears to be considerable interest on the part of the public, particularly when no admission is charged, for travel films and features showing the development of the war industries in the United States.

Comparatively little development has taken place in Mexico in the screening of 16mm motion pictures. So far as is known, only the new General Hospital has any 16mm equipment. It is using it for teaching medical and operating technique. Educational institutions are interested in the medium but the Government cannot furnish the necessary equipment. It may be said, therefore, that there is a potential market in Mexico for educational motion picture services. There are some sixty 16mm projectors, both silent and sound, in Mexico, probably nine-tenths of them silent.

**Nicaragua**—There have been no developments in educational films in Nicaragua and no indication that educational institutions are contemplating any move in this direction. There are relatively few projectors in the country and virtually all of them are privately owned.

**Panama**—It is estimated that there are about two hundred 16mm projectors in Panama, practically all silent. The Educational Film Program of the Office of the Coordinator of Inter-American Affairs involves the distribution to the twenty Republics of Latin America of selected 16mm films on a wide range of subjects. These are shown to relatively small audiences in schools and public buildings. The Embassy has given several such showings recently. The Embassy suggested to the Coordinator's Office that these educationals would reach a far greater audience in Panama if the 16mm films were "blown up" to 35mm for presentation at regular motion picture theaters. Exhibitors would be only too glad to include them on their programs.

The Embassy has three 16mm sound projectors which are used to show educational shorts in schools and public buildings under the Educational Film Program. In addition, *Kodak Panama, S. A.*, has a 16mm sound projector which is loaned out to interested groups. All other 16mm projectors are silent and are privately owned. There is no projection apparatus in schools or public buildings.

**Paraguay**—Educational films are not in use. Educational institutions are thinking along these lines but nothing has been done so far. No schools or colleges use films for teaching purposes and there are no film libraries. There is one 35mm sound projector in use and about three 16mm silent projectors in the schools. There are no slide-films used. Government has no film library nor does it produce films. Prospects for selling films or equipment to educational institutions are fair. They might be interested if they had an opportunity to see films which met their particular needs from both the subject and language standpoints.

**Peru**—There has been considerable development during the past two years. The Peruvian Government has created under the *Ministerio de Educacion Publica* a bureau known as the *Seccion Radio Fusion y Cine Educativo*. This bureau encourages visual education in Peruvian schools and colleges. It has at its disposal a sound truck, employing a full time operator, which was presented to the Government by the International Petroleum Company. The Government, in cooperation with the office of the Coordinator of Inter-American Affairs, is now showing educational films in schools and colleges, clubs, and in the public squares of the principal provincial towns. The subject of employing motion pictures as an integral part of the school curriculum has been long under discussion in Government circles but no definite program has materialized. There are no schools or colleges that maintain film libraries but the Coordinator's office will supply educational films upon request. It is estimated that there are about 400 35mm sound projectors in use. There are perhaps seven 16mm sound projectors in operation in Peru.

Silent 16mm projectors are, with few exceptions, owned by private individuals, and number about 400. Several mining companies, medical societies, and government departments have purchased 16mm projectors for the purpose of showing educational, industrial, and professional films. The number of 8mm projectors in use is estimated at about 250. Slide-films are not used in Peruvian schools. Some of the larger American firms accompany their sales campaign with film presentations, and some progress has been made by the Government in the use of educational films in institutions of higher learning in Peru. Most of such films are of American origin.

**Uruguay**—Considerable progress has been made in the use of educational films. About four films are shown each year on 35mm stock by the *Seccion Cinematografia del Ministerio de Instruccion Publica*, which has shown about 50 films since its establishment in 1922 and maintains a film library. About three films are shown per year on 16mm stock by *Seccion Cinematografia de Ensenanza Primaria y Normal*. The University of Montevideo is the only institution of education which uses films for instructional purposes, but others are interested. Small film collections have been accumulated by the American Embassy and the British Legation. Very few standardized projectors are yet found in schools or public buildings. It is estimated that there are 553 silent 16mm projectors in Uruguay, used mainly in private homes, and 21 sound 16mm projectors. There is a potential market in Uruguay for motion picture equipment and films to the educational institutions. Inquiry in this regard should be directed to the *Ministerio de Instruccion Publica*, or to the University of Montevideo, or to the American Embassy.

**Venezuela**—The Venezuelan Ministry of National Education instituted a program for films in the schools several years ago, but it has never attained any substantial development. The activity so far

has been confined largely to Caracas and a few neighboring areas. So far as can be ascertained, no 35mm or 16mm projectors are in use by the government. Schools do not have their own projectors. The Educational Radio Service of the Ministry of Education has, however, twelve 16mm sound projectors which it makes available, together with competent operators, to schools who are interested. Special showings for student groups are also given at some theaters in Caracas. The Ministry of Education follows a policy of sending films to technical supervisors in the different States of the Republic who arrange for their projection with equipment provided by the State Government.

It may be said that educational institutions in Venezuela are thinking along visual lines but lack of funds still hampers any substantial development. Here again, the Office of the Coordinator of Inter-American Affairs is carrying out its program of distribution of educational films, with projection equipment, and this should materially enhance interest and should effect a possible market in this country after the war.

There are some slide projectors (for glass lantern slides) in several of the experimental schools in Caracas, but their use is not widespread in other parts of the country. No extensive film libraries are maintained by either the schools or the Government Educational Offices. The Government has produced several educational, or documentary, films in Venezuela which were of good quality. These films, three in number, were produced in Venezuelan studios which have shut down, and no important documentary or educational films have been produced by the Government since. Many of the large American firms in Venezuela, representatives of American automobile companies, electrical companies, and so on, make extensive use of educational films, both motion and slide, in their programs of employee-training.

## Audio-Visual Aids in the Schools of Tomorrow

(Concluded from page 10)

for classroom use. However, many more are needed in order to bring more vividly to the student the social, political, economic, and international phase of our history.

5. *Distribution* has long been one of the major problems where it is necessary that audio-visual aids such as motion picture films, slides, recording and transcriptions, be stored at some central source. What is being done to meet this problem? Is the answer fewer sources with larger numbers of prints, or more local sources servicing smaller areas such as one or two counties. The success of the post war program will be determined to a certain extent by the way this problem is met.

6. *Architectural and physical needs* of an expanded audio-visual program must be carefully considered. Poor conditions for projection (light and acoustics) and lack of sufficient equipment will discourage the teacher

in regard to using these aids. No matter how large or how small the school, a room should be provided for preview purposes if the instructor is to get the maximum value from the films.

7. *Teaching helps*, suggestions, descriptive material, and sources of audio-visual aids may well be simplified and condensed. The books mentioned in point seven above, are excellent steps in this direction. These will be a valuable help to the already over-worked director of Visual Education, or the classroom teacher.

In a recent issue of the magazine *Education for Victory* an article entitled "Recent Contributions to the Use of Visual Aids in Education" lists 43 books and bulletins which deal with some phase of audio-visual aids. This list was by no means complete, and yet much of the material discussed in these various books or bulletins is essential if one is to have a good perspective of the part that audio-visual aids can play in our educational program of tomorrow, hence one can readily see the need for condensing and simplifying this material.

8. *Audio-visual aids* should be classified not only in subject fields but in units within that subject field. Such a classification will be of untold help to the inexperienced as well as to the experienced teacher in planning a well rounded audio-visual program.

9. *One or two national meetings* should be held per year, where the leaders can get together and discuss the main issues and as a result provide the dynamic leadership that is needed now. Similar meetings might also be held in each Zone, of the D.V.I., thereby reducing travel to the minimum.

In view of the factors favoring an expanded audio-visual program, and considering the things that must be done, what of the audio-visual program in our schools of tomorrow? The use of the motion picture as a teaching device received a serious setback following the other war. Portable 35mm. projectors produced for use in army camps, were unloaded on the schools. After buying the projectors the school men found that few if any films were available for classroom use, and the price was prohibitive on those that were. It required years to overcome this setback. Will a similar mistake be made again when not only projectors of all description, but hundreds of slide, film strips, and films are thrown on the market? Thousands of slides and hundreds of films have been prepared for certain specific teaching purposes for armed services. When the war is over, if these films are put on the market at very low cost, no doubt many of them will be bought by the schools and again many of the school men will have made a serious mistake. For while they find these films well suited for the purpose for which they were made, they will contribute little if anything to the school program.

The part audio-visual aids will have in our schools of tomorrow gives rich food for thought to the Department of Visual Instruction of the N.E.A., as to how to meet the problems with which it is confronted. It is a challenge to every person interested in seeing audio-visual aids used more extensively in our education program. And the question still stands: "What will be the place of audio-visual aids in the schools of tomorrow?"

# MOTION PICTURES— NOT FOR THEATRES

By ARTHUR EDWIN KROWS

## Chapter XII—And Now They Must Talk

WE ARE ACCUSTOMED to speak loosely about the "sudden" coming of talking pictures. As a matter of fact, even from the time of the first successful demonstration until widespread acceptance, there was a long period of vacillation—about three years for many of the lesser theatres—and the places of non-theatrical exhibition were, with a very few well-to-do exceptions, the last to be "wired for sound." Writers presumably authoritative declared that the growing popularity of sound films was only a fad, and would subside to a normal state in which silent pictures also would hold their own. To this prophecy clung many teachers, ministers, clubmen and industrial users, fearful that their hard-won mute equipment would be rendered useless, and unable to afford the new. So far as they were concerned the prophecy was not altogether without force. Upwards of a dozen years after the fear loomed importantly on the horizon, film rental libraries were still doing a substantial business in 16mm prints of old silent subjects.

### The Parts of Speech

THERE had been talking pictures since before the close of the nineteenth century. One of Edison's first efforts, after his invention of the Kinetoscope, had been to combine it with his phonograph. Indeed, much of the apathy with which the modern talking picture was at first received, undoubtedly was because numerous sound film devices of different sorts had actually appeared in the theatres for many years without working even slight changes in the prevailing form of popular entertainment.

Whenever a type of apparatus showing unusual promise was brought forth, a conglomeration of others also rushed upon the market. Léon Gaumont came to America in 1913 to supervise a New York demonstration of the talking pictures for which a French patent had been granted him in 1901, and showed them in colors into the bargain. He came mainly because, in January, 1913, Edison's improved (but by no means perfected) Kinetophone talking pictures had been received with favor by a few leading theatres. William A. Brady, ever eager to set sail upon the tide of popularity, contracted in the same year for Webb's "electrical talking pictures," and exhibited them at the Funton Theatre, New York, in May, 1914; and a little before that the public was regaled with

Dr. Isadore Kitsee's "vocal pictures" of Harry Lauder, produced at Philadelphia.

There were the Whitman Camera-telephone, revealed in 1904 and exploited by Mark Dintenfass, a prominent independent producer, in 1907; the Powers Fotofone of 1910; the Vivaphone, and Greenham's Synchronoscope, which is said to have represented a passing interest of Carl Laemmle in 1908. Look into the New York *Dramatic Mirror* of March 19, 1913, and see an advertisement by John W. Mitchell: "Wanted—sketches and scenarios for Talking Motion Pictures," and, on Page 24 of the issue of May 28, 1913, behold the already casual use of the term "talkies."

This picture of Thomas Edison's plan to make the world's first talkies by joining phonograph and kinetograph was originally published in *Harper's Weekly*, in the issue of June 13, 1891.

Nor did the Edison Kinetophone pictures at once die out. I was chatting recently with Charles Gilson, an Edison cameraman of those hectic pioneer days. He told me that, until the outbreak of World War No. 1 Edison maintained talking picture studios, by license and using operators provided by his own American company, at Vienna and Moscow. Gilson was at Moscow. He was there when the World War began, with one other operator and an interpreter—three, out of only about nineteen Americans, it is said, in the city at that time.

The popular notion that what held the achievement of the modern talking picture back was because voice and picture could not be synchronized, was mistaken. What actually retarded the development was the need of sound amplification, a problem which was not solved sufficiently until the perfected invention

Installment 53. — Non-theatrical history was made indeed by the advent of modern talking pictures. They came nearly twenty years ago

of the audion tube, the same which signalized the popularization of radio. It was invented by Lee De Forest in 1904 and sold by him for further development to the Western Electric Company in 1907. Then, for the first time, a real quality reproduction of original sound became possible, as did the raising of its volume without distortion. As far as films are concerned, this step was importantly begun about 1919, when De Forest, then a figure notable in "wireless," is said to have turned his attention for the first time to the talking picture device which became associated with his name.

To keep away from the prying eyes of inquisitive fellow-Americans and at the same time to avail himself of trained technological assistance, De Forest carried on his experimental work in Berlin, Germany, until about 1922, when he felt that he had overcome his major obstacles. He then returned to the United States, where, with the backing of a South African theatrical magnate, M. A. Schlesinger, whose headquarters were in New York City, he incorporated his firm of General Talking Pictures.

I first met De Forest in this period through Frank A. Tichenor, who had been made general manager and treasurer. His original offices were in space sublet from Tichenor in the Candler Building, 220 West 42nd Street, precisely where the American Red Cross had had its film center in wartime. The Simplex Projection Room, belonging to Tichenor, was outfitted for private demonstrations of DeForest's Phonofilm, and some of De Forest's first pictures I was permitted to see and hear in that place. Unfortunately, De Forest was an inventor primarily and not also a shrewd business man, a combination which really is a little too much to expect; and a sharp divergence of opinion over management of the corporation led to Tichenor's resignation.

Early in 1923 De Forest gave a public showing of his Phonofilm at the Rialto Theatre in New York. Hugo Riesenfeld, then the director of that house, had watched the more recent developments with great interest, and he opined that while the invention would be popular as an occasional program novelty, it could not, of course, affect the established powers of "the silent screen." The Will Hays office was quoted at about the same time by a New York *Times* reporter as stating warily that students of the film were generally confident that "speakers" would never supersede the movies, and Edison, who surely had had much painful experience, declared flatly that the public had demonstrated that it did

not want talkies. Edison said it emphatically again as late as May, 1926, when the industrial revolution had actually begun. I note these expressions as curiosities, not as criticisms. No person could have known the amazing future for a certainty then.

The widespread, truly mushroom growth of the modern talking picture was thus sudden enough after all, a surprise to every observer, including the engineers themselves who could not have anticipated its immediate popularity even while they worked upon it. And, looking backward, one can see readily enough that the main stress of its evolution belonged naturally in the premises of the Bell Telephone System.

It had been part of the Bell operating plan for many years to conduct a research division for the purpose of constantly improving the telephone service. In the course of such work it had made notable contributions to acoustical apparatus of all sorts, including phonograph recording and radio broadcasting. Naturally it drew into its employ for such accomplishment all needed outside patents. It had needed the principle of the audion three-element tube, invented by De Forest for radio, for amplification of the human voice in long distance telephony. And, having acquired the tube from De Forest, the Bell System quite consistently and properly cultivated possible further applications through its manufacturing division, the Western Electric Company. The modern talking picture, then, was essentially one of the useful, normal by-products of the telephone. But the telephone officials, themselves, were as much astonished as anybody at the tremendous success of the completed apparatus.

Of course, De Forest's Phonofilm company did not go out of existence merely because the inventor had made side contracts, and short subjects were produced at his New York studio by his own process until well into the popular sound film period. There were promises the establishment of a Phonofilm Library at the Smithsonian Institution in Washington, the National Museum; and one of the subjects said to have been destined for the collection was a Phonofilm of Edwin Markham reciting his *Man With a Hoe*. This was actually produced in 1926. Herbert Hall Winslow, playwright and director for World Film in the pre-war days, a neighbor of mine, wrote and produced several Phonofilm one-act plays after that, one or two for industrial clients.

In 1922, while De Forest was telling representatives of the press in New York City about the coming marvels of his Phonofilm, word seeped out that the General Electric Company, heavily interested in radio devices, was also developing a sound picture apparatus. Upstate there, at Schenectady, the distinguished scientist, Irving Langmuir, was working on amplification tubes of other sorts, and the Company's Dr. C. A. Hoxie had evolved a strange-looking affair called the Pallophotophone, employing, oddly enough, a principle developed by Alexander Graham Bell years before, for

simultaneous recording of voice and appearance.

Late in 1922 the Company even released a picture of it, showing Miss Mabel Boardman making a speech to it

In December, 1922, Mabel Boardman, American Red Cross National Secretary, appealed for funds through General Electric's Pallophotophone. Recording was done at Washington and her words were broadcast thereafter from Schenectady.

for the benefit of the American Red Cross. To develop the Hoxie apparatus further, when the Bell Telephone Laboratories struck a bonanza with the device, the General Electric Company pooled patents belonging to Westinghouse, the Radio Corporation of America and themselves directly.

Research activities of the General Electric Company had many aspects resembling those of the Bell Telephone Laboratories, but the two organizations, recognizing that their aims were essentially different, (the former being interested primarily in light, heat and power, and the latter chiefly in communication) entered during the National emergency needs of World War No. I, into an agreement permitting their joint access to discoveries applicable to their main, non-conflicting purposes. Factors which comprised the talking picture bore heavily on the respective leading interests of both companies, so both shared in its exploitation, choosing slightly different avenues to the same result. The theatres and studios, therefore, were given their choice of the Western Electric recording and reproducing system, belonging to the Telephone Company, and the R.C.A.-Photophone system, which was controlled by General Electric. But sound films produced for either system could be reproduced satisfactorily and with full permission of the patent owners, on the other.

I shall not try to relate the dramatic circumstances in which the producers of theatrical silent pictures were persuaded to attempt the production of modern talkies, for that has been done voluminously in other places and also by many other hands. It is of interest here, however, that the special agent of the Bell Telephone Laboratories who first induced prominent theatrical men to come and see the marvel to which they at first

were so indifferent, was Charles Johnson Post, a passing earlier figure in these pages. And probably the first of the "all-talkies," made by the Bell Telephone process—representing the invention of

the telephone by Alexander Graham Bell and his demonstration to Dom Pedro, emperor of Brazil, at the Philadelphia centennial exposition of 1876—was produced in 1926 under the direction of Howard Gale Stokes. It was exhibited that year in the Telephone Company's display at the Philadelphia sesqui-centennial exposition.

Another bit of human interest in the introduction of modern talking pictures which seems to have escaped the historians, is that as soon as Albuin Mariner heard of the interest of the powerful sponsors, he was seized with a great desire to be the first to photograph an actual talkie for public release. He applied to those in charge at General Electric and was taken on. Howard Stokes at the Telephone Company was first. But Mariner was *one* of the first nevertheless. He produced the admirable four-reel lecture by Irving Langmuir entitled "Oil Films on Water," still to be found importantly on the General Electric educational list.

Walter J. Rich, a second special agent of the Bell Telephone Laboratories, contracted with Warner Brothers for the first Western Electric theatrical talking picture license late in 1925, and experimental production began at once in the Flatbush studio which had come to Warners the preceding spring with their purchase of the Vitagraph Company of America. August 7, 1926, at the former Knickerbocker Theatre, in New York City, they presented their first public sound program. It opened with a talking picture of Will Hays, who expressed his belief to the audience that the invention would revolutionize the film industry. The actual turning-point in the industry, however, is commonly agreed to have been the presentation of "The Jazz Singer," starring Al Jolson, October 6, 1927.

### Going Into Business

OF COURSE, the Bell Laboratories were first established in talking pictures through their theatrical contracts, but they had a further advantage because the innovation was acoustical more than a mere matter of picture projection; or synchronous motor drive, these aspects having been developed in the main before. They pursued the advantage energetically. To keep the new by-product distinct from telephone interests, the Western Electric Company, the manufacturing division of the telephone system, organized a wholly owned subsidiary called Electrical Research Products, Inc., and equipped it to exploit the patents. Its headquarters were established in the Fisk Building, 250 West 57th Street, New York City, and it quickly acquired a shorter, though unofficial name, made of the initial letters of the title—Erpi (pronounced "urpy") which became current as one of the most mystifying words in the new studio lingo of the "talkies."

Charles W. Bunn, the sales manager, experienced in prevailing theatrical motion picture methods, was exceedingly efficient; but the desire for equipment, stimulated by the avid public demand for sound films, was so tremendous that his job became one of trying to fill orders rather than securing them. By March 30, 1930 there were 5,200 theatres in the United States "wired" with the Western Electric system alone. There was a known saturation point, however, there being a given number of motion picture theatres in the world, and, when all the worthwhile theatres and studios had been supplied, it was necessary to lay plans to provide further work for the large selling force. Attention of the executives therefore turned to non-theatrical possibilities. In anticipation of this, Western Electric and R.C.A.-Photo-

phone had made a further agreement suggesting that by which a pope had once divided the Western Hemisphere between Portugal and Spain, whereby Western Electric should have the educational and industrial market, and R.C.A.-Photophone should be permitted to exploit talkies in the home.

At that time, in view of the then recent mad scramble of theatrical men to lease all possible sound equipment, it was inconceivable to the executives of Erpi that, when portable equipment was provided for non-theatrical use, it would not sell in the same speedy manner. Plans were made in the confident assumption that it would. So, while the Bell Telephone Laboratories fitted the sound attachments into approved silent 35mm silent models, such as the Holmes Projector and the Super-De Vry, and the Western Electric Company began regular manufacture in that department also, Erpi set up an elaborate non-theatrical sales organization. Its headquarters remained in the Fisk Building, New York, and formal branch offices were opened in Pittsburgh, Detroit, Washington and Los Angeles, in addition to the incidental representation in regular theatrical branches.

Lists were compiled of all the presumably possible places (exclusive of homes) where the portable equipment might be used—schools, clubs, hotels, hospitals, passenger boats and many more—and the field representatives, armed with promotional literature and lessons in proper approach, advanced to attack them. The necessarily high introductory price, saddled with all of the preliminary costs of development, was an obvious barrier, but it was believed that meeting this was a matter of education, the user to be made to see that

cheap equipment could mean only shoddy results, and that, with these superior Western Electric implements, increased returns would soon compensate for the added costs.

What seemed graver was the need of talking pictures to keep the equipment working; but prospective customers were assured, in all good faith, that the lack was being met rapidly with a growing supply. The quantity was growing, indeed, but scarcely enough, as yet, to constitute an important non-theatrical sales point, and encouragement was needed there, too. It thus became quickly evident that the non-theatrical division had especial demands, and attention was directed to the so-called non-theatrical producers to stimulate their output.

It had been decided to give production licenses, for use of the Western Electric recording system, to those non-theatrical organizations which would pay \$300,000 apiece per year for the privilege. Theoretically this sum would accumulate through the making of 600 reels of finally assembled negative per annum, with a \$500 royalty on each. It was argued that a studio which could not sustain that much business had little excuse for being. The non-theatrical producers to whom this proposition was presented generally laughed at it as out of all sense. But Erpi already held larger licensing contracts with the theatrical studios, and was wary of setting dangerous precedents in a lesser, uncertain field.

One may think of the non-theatrical producers in this period as generally peering forth from their storm-proof cellars, to which they had retired precipitately at the first sign of the talkie tornado, waiting to see what might happen to the world at large before perfecting any plans of their own. Their business was at a standstill in the main. They were marking time; and this was true, too, of even the smaller laboratories. There were no real exceptions. Those who could in some way afford the new equipment, could not obtain it as long as orders from theatrical establishments were unfulfilled. For even those, the factories, working night and day, could not keep up with the demand.

And, as for the word-minded non-theatrical customers, they required time in which to recover from their own first enthusiasm for the new talking pictures which now could mouth their most fulsome verbal arguments and self-praises. What had checked these customers were the astoundingly high price, as compared with what they had been accustomed to pay, and the necessarily brusque attitude of busy talkie equipment manufacturers who had plenty of other customers that were willing to meet any price if they could only have the machinery. To recover from this stunned surprise the non-theatrical clients now needed pause to decide that perhaps their wants might be met by the old kind of silent films after all—and in the interval they bought nothing. Every person everywhere, with a motion picture contact, was readjusting his grasp of the business.

"My God, it talks!" exclaimed Dom Pedro of Brazil in 1876 when Alexander Bell showed him his telephone at the Philadelphia Exposition. Fifty years later H. G. Stokes reproduced the scene for Bell System's first industrial talkie.

On the eve of Carpenter-Goldman's greatest triumph Arthur Carpenter sold out, ending one of non-theatricals' best known partnerships.

Later years were to bring upon the Bell System inevitable charges, by unworthy enemies, that it had used its giant's strength tyrannously in this entirely accidental, virtual monopoly of talking pictures; but the non-theatrical industry (and the theatrical industry, too) may be eternally thankful that it was the Bell System, instead of some other less scrupulous form of Big Business, which held the power. That it was so was, to my mind, nothing short of a divine interposition, for there is no Big Business in America with better sense of public responsibility than the A. T. & T., and, moreover, with its attention centered primarily on telephone service, it had no wish to remain longer than ordinary prudence demanded in the making and distribution of films. Even in its final leave-taking, it did not pull out suddenly, but gently, that there might be no disruption of the industry's proper service.

While Western Electric was turning out equipment in those first formative years of 1926-1930, the sales heads of the fortunate talkie enterprise found some opportunity to coördinate their own first impressions of the non-theatrical field. For reasons sufficiently apparent to the reader who has followed this record of their growth, the efficiency of even the foremost non-theatrical producers was not impressive to the first view of really Big Business, and the Erpi executives became convinced that if the field was to be made to pay, it needed not only encouragement but support.

### The Adopted Son

THEY would prove the case by molding one of these non-theatrical producing units along Big Business lines, showing how the work should really be conducted instead of in the old, wasteful fashion, and thus, with an enlight-

ened, happy, prosperous field, creating a new market for their product and service. This was not an unknown method in the motion picture industry at large. Years before, 1915 or thereabouts, the new Paramount organization had told those theatre managers, who had declared that they could not afford to pay the prices which had been set by expert study of each given situation, that they would prove the trouble to lie in inefficient operation by putting in its own highly-trained specialists to run the business for awhile and show the managers how to do it.

But Erpi did not wish to spoil any potential customers by this well-intended paternalistic interference, and besides, among the companies generally, there was a truculent attitude at the idea of a newcomer telling men of their own tough, practical experience what they ought to do. Moreover, it was not then certain that the market for silent films would cease. For Erpi there was, again, the question of what producer could make a non-theatrical picture best, because, if any film maker was to be encouraged, it was imperative that he should be an able one. On this point Erpi naturally deferred to its engineers, who had been studying films. And to understand that deference one must remember that in those early days of the modern talking picture, the authority of the acoustical engineers from the Bell Telephone Laboratories in New York was absolute, even in the great studios of Hollywood.

The engineers down at West and

For more than a decade Francis Lyle Goldman's creative ability was chief asset of the firm in which he was the technical head.

Bethune Street, being men who obviously preferred mental pursuits, were really more interested in educational and research possibilities of the new apparatus than in the amusement phases which were paying such heavy dividends. Early in 1927, Dr. E. B. Craft, executive vice-president of the Bell Telephone Labora-

tories, lectured before the New York Electrical Society, and, showing his audience a specimen talking picture, he suggested, as food for their imagination, the possibilities of a medium which, had it been available earlier, might have presented lectures on physics by Faraday, on painting by Michelangelo, literature by Shakespeare and electricity by Bell. But, when most of those Bell engineers who had the new apparatus actually in hand, became specific in their ideas, they thought of non-theatrical pictures in their own terms, namely, moving graphs and charts. They thought next of the men who had made a great deal of this sort of product—Carpenter and Goldman, whose scientific animation ranked high, and who actually had produced some intricate screen demonstrations of the sort for the Telephone Company.

Although Arthur Carpenter had moved out of the concern by now (he was presently to sign up with Warner Brothers as a research assistant), his share had been bought over by an elderly inventor named George Lane, and Lane had been trained as an engineer and could talk the laboratory language. More importantly in the situation as it stood, one other member of the favored concern, Joseph Coffman, could not only talk the laboratory language, but he could discourse authoritatively about film emulsions, optics, developers, trick photography and (as a former director of visual education), educational standards. Here surely was the non-theatrical unit which was worthiest of support, and, happily, too, it was situated right in New York where its growth might be carefully measured.

The Carpenter-Goldman Laboratories, however, while not insensible of this interest, had been wishing for expansion for some time, and had other plans afoot. These were partly to sublet space to Max Fleischer, who was planning a series of sound cartoons for Paramount release, but chiefly to take over an idea with which Charles Urban had toyed when he had moved his Kinetograph Laboratory to Irvington-on-Hudson. This involved a "home" motion picture projector called the Spirograph, the pictures for which were printed in a spiral on a transparent disk about the size of that used on an ordinary photograph. My recollection is that the period of a single showing equalled the screen time of approximately seventy-five feet of regular theatrical film, or one and one-quarter minutes at the projection speed then standard. To handle this new expansion, and also to add laboratory facilities forbidden them by the fire laws at the Madison Avenue address in the Canadian-Pacific Building, Carpenter-Goldman had moved to a detached structure across the East River from midtown Manhattan, in Long Island City, the Borough of Queens.

(To be continued)

# The Film and International Understanding

## The Film in New China in a New World

DR. JOHN E. DUGAN, Editor  
Haddon Heights, New Jersey, Schools

THE motion picture is destined to play an important part in the rehabilitation of China and in her position in the new post-war world, according to T. Y. Lo, president of the China Motion Picture Corporation of Chungking.

"When this war is over, China's 450 millions of people will require a knowledge of modern science with the view of opening up the country's unlimited natural resources and utilizing her potential manpower," Mr. Lo said, "and the motion picture, with its efficiency and the ease and speed with which it serves the masses, will play no insignificant role in this enlightenment and education."

Mr. Lo pointed out that in China today, in spite of bombings and lack of equipment, production of motion pictures, both for entertainment and informative purposes, is being maintained by Chinese directors, actors and technicians.

"We are combating almost insurmountable obstacles in bringing these movies to our people, so important do we consider them. Because there are at present only 112 theatres in Free China, and some of these cannot be kept going because of bombings, the Chinese government and its agencies operate mobile cinema units so that films can be shown to the soldiers and the people. These mobile units travel from city to city and village to village; to the battle front, and even to the rear of the Japanese lines, with their programs of shorts, features and documentaries. Some of the units that go into the remote regions carry a program for one year. This requires careful planning of production in advance and astute selections of subjects.

"While the Chinese motion picture industry is working heroically now to keep up the flow of pictures, it is much concerned with the future use of films in the reconstruction period after the war. An ambitious program of visual education has been outlined. Its main purposes include the training of thousands of technicians for reconstruction work; imparting general scientific knowledge to the people so they may be able to take full advantage of modern inventions and improvements related to a progressive life; to let the people know the plans for reconstruction so they

As an international medium of education the motion picture has a wider appeal than literature, a more emotional appeal than radio, and provides the easiest and speediest method of instructing the masses.

—T. Y. Lo

will develop a sense of individual responsibility; to acquaint the 450 millions of people with the political, economic, cultural and social affairs of the rest of the world; and to educate the people in a practical way toward creating a better world in which their responsibility is to cooperate with others.

"This is a large order, but we, in China, believe that the power of the motion picture cannot be over-estimated. The motion picture is of

more absorbing interest to the young than to the old, and since it will be the young people of today who will make the world of tomorrow, films will be a great factor in shaping the future."

### Philadelphia Museum of Art Film Programs On International Understanding

"This Is Your World," a free film program series revealing the culture and character of the peoples of other nations, is being presented during the present season at the Philadelphia Museum of Art. The series presents a different program each week, and each program is devoted to a different nation or area. Each weekly program is presented on Saturdays and Sundays at 1 and 3 p. m.

Typical of the programs presented are a Chinese program which included the films *Out of a Chinese Painting Brush* and *China's 400 Million*, and a Slovak program presenting the Slovak film classic *Janosik*.

The programs were planned with the cooperation of Brandon Films Inc., distributors of the films. They include full length and short films on Belgium, China, Czechoslovakia, France, England, Scotland, Ireland, India, Germany, Mexico, Ecuador, Guatemala, Brazil, Chile, Holland, Soviet Russia, Spain, and the United States.

### Canada Pools Projection Resources

To facilitate the use of films by organizations in Canada, projector pools have been set up in several large centers. They are under the jurisdiction of volunteer film officers who undertake to coordinate arrangements for film showings in their communities. They will refer requests for films to the most convenient library, arrange for the loan of a projector, and if necessary supply a qualified volunteer projectionist.

It is the hope of the National Film Board to see projector pools established in every town where sound projectors are available and where there is a demand for film service. The Board offers its services to arrange details of such a service at the request of any community which possesses at least one sound projector available for free loan.

### Kodachrome Series on European Culture

Anticipating the increasing interest in an understanding of central Europe, the Society for Visual Education has issued a list of 217 selected Kodachromes for use in teaching the culture and languages of central Europe. 46 of the Kodachromes deal with Yugoslavia, mysterious and intriguing tinder box of the Balkans.

# Various Types of Realism—In Hand-Made Lantern Slides

By ANN GALE

Roosevelt High School, Chicago

HIGH school children find it difficult to understand modern, primitive, and Oriental art, because they are living back in the ideals of Renaissance artists. The children try to make things look photographically real while most western artists, since the development of the photograph, have gone on into other kinds of realism. This series of slides will help to broaden their art experience.

1.) The Egyptians developed a style of perspective representing distance by putting the nearest object at the bottom and building up the farther things on top. Important people were represented larger.

2.) The Persians, Indians, and Japanese made their objects get larger diagonally as they disappeared, giving a cross-wise projection in the picture.

3.) The Chinese and the 19th century impressionists used aerial perspective showing the blurry outlines and the bluer color of objects in the distance.

4.) Florentine artists of the early Renaissance developed the rules of perspective to show receding solid forms in a picture. These rules were developed by succeeding Western artists for almost five centuries.

5.) Early 20th century artists with photographs highly developed have gone back to older types of realism by using some of the Oriental diagonal projection and the Egyptian method of showing both top and side views at the same time.

6.) Other artists have delved into another kind of realism. They have tried to crystallize the peculiarly unreal reorganization of past experiences that takes place in dreams.

The simplest type of hand-made slide is made by drawing or tracing on finely finished etched glass with ordinary medium lead pencil. Color, by special crayons or inks, enhances the slides greatly. Fine effects are obtained by blending with crayons. About one-third inch margin should be left all around the slide. The slide is readily cleaned with soap or washing powder to receive a new picture.

## Department of Visual Instruction

PROBABLY no Department of the National Education Association has suffered such disruption by war conditions as the Department of Visual Instruction. The extraordinary use of visual methods of teaching and training, as developed in the past two years for Army, Navy, and Air Forces, is a phenomenon without precedent in American education. It required a heavy draft of talent and experience from the whole visual field. The number of DVI members thus called away from their peacetime posts is not known, but it comprises a very considerable proportion not only of regular members but particularly of the Staff Officers of the ten Zones. New appointees to such vacancies are themselves often called into service. To keep the Staff personnel complete and efficient is impossible under such conditions. Smooth functioning, therefore, of the national Department of Visual Instruction during the war emergency is out of the question. Incidentally, this situation should be cause for immense satisfaction to every DVI member—for the exigency of war has brought "visual education" into the limelight as never before in its history.

For the benefit of DVI members, old and new, we give below the latest corrected list of National and Zonal Officers, with but one vacancy still existing. It is hoped that it may stand for the duration.

Our primary aim—when annual meetings are suspended and membership campaigns are seriously interrupted—should be to maintain DVI membership at the maximum possible during the war period. Present members can play a major role to this end—*simply renew your membership now*. It is not worth wondering or inquiring "when your membership expires." What possible difference can that make? With the brilliant promise now ahead for the visual movement, every DVI member must want his membership to be continuous and permanent. Don't risk even an approach to your expiration date. Move it ahead, constantly, and keep your membership safe against carelessness or oversight. Send in another \$2.00 fee to your Zone Secretary now, and keep present DVI membership at its present figure, ready for real growth to record totals in postwar days.

N.L.G.

### Zone II to Meet with School Administrators In February

Word has just been received that there will be a meeting of Zone II, with the Metropolitan New York Branch as hosts, at the Pennsylvania Hotel on the afternoon of February 23rd, in conjunction with the regional meeting of the American Association of School Administrators.

The session will be devoted to a discussion of the topic: "Visual Education, Today and Tomorrow." A dinner meeting at Town Hall Club will follow the afternoon program.

### National Officers

*President:* Mrs. Camilla Best, Director, Division of Audio-Visual Aids, Orleans Parish School Board, New Orleans, La.

*Secretary-Treasurer:* Miss Lelia Trolinger, Director, Bureau of Visual Instruction, University of Colorado, Boulder, Col.

### Zonal Officers

**Zone I** (Connecticut, Maine, Massachusetts, New Hampshire, Rhode Island, Vermont)

*President:* Edward F. Wheeler, Department of Education, Bristol, Conn.

*Secretary:* Miss Dorothy A. Allard, 8 Wells Road, Reading, Mass.

**Zone II** (Delaware, Maryland, New Jersey, New York, Pennsylvania, Virginia)

*President:* Miss E. Winifred Crawford, Montclair City Schools, Montclair, N. J.

*Secretary:* James S. Kinder, Pennsylvania College for Women, Pittsburgh, Pa.

**Zone III** (Indiana, Kentucky, Michigan, Ohio, West Virginia)

*President:* H. B. Allen, West Virginia University, Morgantown, W. Va.

*Secretary:* William G. Hart, Fordson Board of Education, Dearborn, Mich.

**Zone IV** (Illinois, Iowa, Missouri, Wisconsin)

*President:* Alvin B. Roberts, Haw Creek Township High School, Gilson, Ill.

*Secretary:* H. L. Kooser, Iowa State College, Ames, Ia.

**Zone V** (Minnesota, North Dakota, South Dakota)

*President:* Dr. Ella C. Clark, Winona Teachers College, Winona, Minn.

*Secretary:* V. F. Ellies, Winona Public Schools, Winona, Minn.

**Zone VI** (Idaho, Montana, Oregon, Washington)

*President:* Alan Finstad, Fife School, Route 2, Tacoma, Wash.

*Secretary:* Miss K. S. Klise, Sunnyside High School, Sunnyside, Wash.

**Zone VII** (Arizona, California, Nevada, New Mexico)

*President:* Boyd B. Rakestraw, Extension Division, University of California, Berkeley, Cal.

*Secretary:* George M. Jamieson, Jr., 815 South Hill St., Los Angeles, Cal.

**Zone VIII** (Colorado, Kansas, Nebraska, Utah, Wyoming)

*President:* Dr. J. R. MacNeel, University of Wyoming, Laramie, Wyo.

*Secretary:* Leo Arnoldi, University of Wyoming, Laramie, Wyo.

**Zone IX** (Arkansas, Louisiana, Oklahoma, Texas)

*President:* Dr. B. F. Holland, University of Texas, Austin, Tex.

*Secretary:* D. W. McCavick, Bureau of Visual Instruction, University of Texas, Austin, Tex.

**Zone X** (Alabama, Florida, Georgia, Mississippi, North Carolina, South Carolina, Tennessee)

*President:* (to be appointed to succeed Oscar Sams).

*Secretary:* Mrs. H. L. Harris, University System of Georgia, 223 Walton St. N.W. Atlanta, Ga.

# SCHOOL MADE MOTION PICTURES

**HARDY R. FINCH, Editor**  
 Head of the English Department  
 Greenwich High School, Greenwich, Conn.

THIS being the first issue of a new year, it is a good time to review the contents of this column since its birth in October, 1941, and to index the questions and answers which have appeared here under the auspices of Mr. Godfrey Elliott and the present writer, who, regretfully, is forced by the pressure of other duties to make this his last contribution. The following index, it is hoped, will be of particular value to newer readers of THE EDUCATIONAL SCREEN; it may be helpful to our older friends, as well. Items are arranged topically, with brief annotations and reference to the issues in which the full discussions are to be found.

## I Distribution

Customs regulations (Canadian): Sept., 1942, p. 272.  
 Exchange agencies: information on how to exchange school films: Feb., 1942, p. 73

## II Editing, splicing, etc.

Film wastage: amount to plan for, etc: May 1942, p. 199; Jan. 1943 pp. 22-24.  
 Re-editing old films to make new ones: Jan., 1943, p. 24.  
 Responsibility for: who should do it, and why: Feb., 1943, pp. 62-64.  
 Splicing: how to do it: April, 1943, p. 140.  
 Transitions: their importance, various techniques, etc.: May, 1943, pp. 176, 178.

## III Equipment and accessories

Cameras:  
 precautions to be observed in purchasing: Feb., 1942, p. 73.  
 value of various camera speeds, April, 1942, p. 150.  
 Dark room—portable; for re-winding film to make double exposures, etc: May, 1943, p. 178.  
 Exposures meters: importance of, use of: Oct., 1941, p. 350; Nov., 1941, p. 401; Nov., 1943, p. 346.  
 Film cleaners: kinds, use of: April, 1942, p. 150.

### Filters:

use of various kinds, including haze filter with Kodachrome: April, 1943, p. 142; Sept., 1943, p. 258; Nov., 1943, p. 346.

Gloves: for handling film: Sept., 1942, p. 272.

### Lenses:

recommended for purchase with school camera: Jan. 1942, p. 33.  
 tables for hyperfocal distances, lens fields, etc: May, 1942, p. 199.  
 importance of such tables: June, 1942, p. 235.

### Photofloods:

ampere rating and use of various sizes: Dec., 1941; p. 438; April, 1942, p. 150.  
 "Daylight blue" type: use in mixed natural and artificial light: Nov., 1941, p. 400; Dec., 1941, p. 438.  
 mixture of photoflood and natural light; why to avoid: Nov., 1941, p. 400; Nov., 1943, p. 346.  
 over-loading of electrical circuit, checking of fuses, etc: Dec. 1941, p. 438.

References to literature on the subject: Nov., 1941, p. 401.  
 Sound recording equipment: cost of: Sept., 1942, p. 272.

Summary of equipment and accessories needed for general school film production: Oct., 1941, p. 350.

Titling devices: Oct., 1943, p. 300.

### Tripods:

essential need for and use of: Oct., 1941, p. 350; May, 1942, p. 199.

**EDITOR'S NOTE:** Donald A. Eldridge, Secretary to the Board of Admissions of Wesleyan University, Middletown, Connecticut, has asked to be relieved of the responsibility of continuing the monthly Question Box he has been conducting. His work on a Ph.D. at Yale University is consuming all of his additional time. Your editor wishes to thank Don for the splendid help that he has given.

Captain Godfrey Elliott, who will conduct the Question Box again after the war is over, is now stationed with the Training Aids Division of the Army Air Forces in New York City.

tripod triangle: how to make or buy one: Sept., 1942, p. 272.

War's effect on supply of equipment: Jan., 1942, p. 33.

## IV Film stock

### Color film:

filters, types and uses: Nov., 1941, p. 400; Nov., 1943, p. 346.  
 interior use of: Nov., 1941, p. 400; Nov., 1943, p. 346.  
 titles made with color film: Oct., 1943, p. 300.

### Processing:

duplicate scenes, where same scene is to be used in different parts of same picture: Feb., 1942, p. 73.  
 prints (copies): cost and sources: May, 1942, p. 199.

### Types of film

black and white, color: characteristics and limitations of each; reversal compared with negative, advantages and disadvantages of each: Oct., 1941, p. 351; Nov., 1941, p. 400; June, 1942, p. 237; Nov., 1943, p. 346.  
 8mm. compared with 16mm: their relative cost and effectiveness: March, 1942, p. 113.

Sub-standard or "cut rate" film: cautions in use of: June, 1942, p. 235.

War's effect on supply: how to get it: Jan., 1942, p. 33; Jan., 1943, p. 22; Nov., 1943, p. 344.

Weston speeds of Kodachrome, orthochromatic, panchromatic, etc: Nov., 1941, p. 400.

Work print: defined; its uses and cost: Sept., 1942, p. 272.

## V Organization and operation of school film projects

Contests: all schools eligible: Mar., 1942, p. 113.

Exchange agencies: for exchange of ideas and films: Feb., 1942, p. 73.

Organization of production personnel: fixing responsibilities, division of labor, etc: Feb., 1943, p. 62.

supervision and guidance: Feb., 1943, p. 62

training and practice in techniques of production; how to organize training courses: March, 1943, pp. 100, 108.

Pre-requisites: equipment, financing, administration: Oct., 1941, p. 350.

### Public relations films:

detailed suggestions on planning, writing, subject-matter, filming, presentation, etc: Feb. 1943, pp. 62-64.  
 advice for the novice: March, 1942, p. 113.

References to literature on the subject: Nov., 1941, p. 401; Feb., 1942, p. 73; June, 1942, p. 235; March, 1943, p. 100.

### Subjects for films:

Exchange of ideas: Feb., 1942, p. 73.

Selecting idea for a first film: June, 1942, p. 235.

Re-editing old films to make new composite films: Jan. 1943, p. 24.

### Terminology:

definition of synopsis, continuity, scenario, script: Jan., 1942, p. 33.

of scene: Sept., 1942, p. 272.

(Concluded on page 28)

# Visual Aids are more effective

## With Brilliant RADIANT SCREENS

For both teachers and students, all types of visual aids are more efficient when projected on Radiant Screens with their remarkable Hy-Flect Glass Beaded Surface. Details show up more sharply. Black and white projections of motion pictures and slides are clearer, more contrasting. Colors stand out more vividly. Student interest and attention are definitely increased. The difference between Radiant Screens and makeshift screens is startling. Every user of visual aids should get the complete story.

## Radiant Screens offer many Exclusive Features

The model EC Wall and Ceiling Screen illustrated above has been used with outstanding success in a large number of universities, schools and training centers. The new lightweight, stream-lined metal housing protects the sturdy, pliant Hy-Flect surface. Special

two-way hanger for both wall and ceiling suspension. Radiant's special surface treatment minimizes edge curling and sagging. Heavy duty construction insures longer, satisfactory life. Heavy duty metal tripods available where permanent installation is not feasible.

### "The Army Uses Training Films"

**A Valuable Manual for all Teachers**  
The U. S. Army has permitted Radiant to publish a new manual on training with films. The material is based on actual training experience—and is humorously illustrated. Sent FREE to all Educators who request it on school letterheads.

### Can You Get Radiant Screens Now?

The complete Radiant line of metal screens is available in limited quantities to essential users who obtain WPB approval of their applications. Others may obtain their choice of the full line of Radiant Non-Metal Screens. For complete details write today for new Radiant Catalog.

#### VI Script-writing, scenarios, etc.

Definition of terms: script, scenario, synopsis, continuity: Jan. 1942, p. 33; of scene: Sept. 1942, p. 272.

Organization and preparation of subject matter, in detail: Feb., 1943, p. 63.

Sample sequences: April, 1942, pp. 149-50; Feb., 1943, p. 63.

Script clerk's records: May, 1942, p. 199.

Titles: Oct., 1943, p. 300.

#### VII Sound films

Cost of adding sound to 16mm. film: Dec., 1941, p. 438.

Cost itemized and further discussed: Dec., 1943, p. 394

Cost of 16mm. sound recording equipment: Sept. 1942, p. 272.

Methods of recording: discs, direct, etc.: Feb., 1942, p. 73; Mar., 1942, p. 113; Dec., 1943, p. 394.

References to literature on subject: Dec., 1941, p. 438; Dec., 1943, p. 394.

#### VIII Techniques

Blackboards: how to overcome troublesome reflections: Nov., 1941, p. 400.

Color photography: use of camera, lighting, etc: Nov., 1943, p. 346.

"Dolly" shots: how to improvise: Jan., 1942, p. 33.

Duplicating scenes: how to make duplicate scenes for use in different parts of same picture: Feb., 1942, p. 73.

## Experimental Research in Audio-Visual Education

DAVID GOODMAN, Ph.D., Editor

### A STUDY OF THE VOCABULARY AND COMPREHENSION DIFFICULTIES OF SOUND MOTION PICTURES

**Investigator:** JOE PARK—Abstract of doctoral thesis completed for degree of Doctor of Philosophy at the University of Michigan.

**Purpose:** To determine the vocabulary and comprehension difficulties of sound motion pictures.

#### Introduction

Since it would have been impossible to follow all the lines of inquiry opened up by the problem it was decided to limit the investigation and endeavor to find answers to the following specific questions:

1. Is the vocabulary burden of classroom sound motion pictures excessively heavy?
2. Is the average sentence length of the sentences used in the verbal accompaniment to classroom films too long?

Authors of investigations on the vocabulary burden of textbooks often had made a word count or an analysis of sentence length but seldom had they gone into the problem of how well pupils understood the material presented in the textbooks. In this investigation it was decided to go further, by means of tests, than these authors had gone and to find out what difficulties pupils actually encountered and the influence of these difficulties on comprehension. This led to the inclusion of the following questions:

3. Do pupils believe that if easier words were used they would understand the films any better?
4. Do pupils recognize the supposedly difficult (infrequently used) words presented in the verbal accompaniments to films?
5. What is the relationship of pupil opinion of vocabulary difficulty and difficulty as measured by vocabulary tests containing the infrequently used words which appear in the sound track?
6. Do children learn vocabulary from the presentation of sound films?
7. Is the meaning of difficult words clarified in the verbal accompaniment to sound films?

The issue of interest, its bearing upon and its relationship to vocabulary burden led to the addition of the following three questions:

8. Are pupils interested in didactic sound films?
9. What is the relationship between pupil interest in viewing films and the vocabulary burden of films?
10. What is the relationship of interest in films to gain in vocabulary?

Because it was expected from the data obtained to be able to compare the vocabulary burden of films with associated comprehension difficulties, it seemed wise to include questions 11 through 18.

11. How well acquainted are children with the content of films before viewing them?
12. Does the viewing of a film give pupils a better understanding of the topic involved than they have had before?
13. Do children learn content from viewing film?
14. What is the relationship of pupil opinion of vocabulary difficulty and gain in content?
15. What is the relationship of sentence length of verbal accompaniments to gain in knowledge of content?
16. What is the relationship of the mean vocabulary level of films to gain in knowledge of subject matter?
17. What is the relationship of pupil interest in films to gain in knowledge of content?
18. What is the relationship (correlation) between vocabulary difficulty encountered by pupils and gain in knowledge of content?

# JUST RELEASED! RCA'S EXCITING AND INSPIRING NEW EDUCATIONAL FILM...

**SEE** how the famous U. S. Army Signal Corps teaches young Americans to use radio and electronic communications equipment under stress of typical battle conditions.

**Available to schools at NO CHARGE except regular transportation costs!**

Fast-moving, action-packed, authentic... plenty of human interest, too, as it tells the story of how two young radio "hams" are transformed by the Army Signal Corps and the Navy into valuable members of Uncle Sam's great fighting team. Write for booking date TODAY... use the coupon below.

NOTE! Other RCA 16 mm. Sound Films available at transportation cost only are "TELEVISION"; "AIRWAVES"; "UNSEEN WORLDS"—the story of the Electron Microscope; "ELECTRONS ON PARADE"—Radio Receiving Tubes at Work. Write for booking dates.

**Keep on backing the attack! Buy More War Bonds!**

**SEE** how radio communication enables our reconnaissance planes to "locate" enemy targets so they can be destroyed by our batteries on land and sea... or by bombers.

**SEE** how the world's best Navy develops top-notch radio operators through an intensive training program in the classroom, in the field and aboard ship.

**SEE** the vital part radio and electronic equipment play in co-ordinating the work of our land, sea and air forces during difficult amphibious operations.

**Mail the coupon now for your booking date!**

# The Literature in Visual Instruction

## A Monthly Digest

ETTA SCHNEIDER RESS, Editor  
New York University Film Library

### UTILIZATION

**How to Use Audio-Visual Aids: Part I. Films, Filmstrips and Lantern Slides**—Elizabeth Goudy and Lt. Francis W. Noel, USNR—*Business Education World*, 24:144 November, 1943.

Two basic reasons underlying the poor use of educational films by teachers are, first, that there is a carry-over from the entertainment film that suggests that films are a novelty and do not involve any participation or follow-up on the part of the observers; and secondly, that the setting up of a film projector and the darkening of the room often involves such a change in the usual classroom routine that it is regarded as a diversion.

A pattern of use is suggested in the articles as useful in promoting good teaching technique: the pattern includes teacher preparation, class preparation, utilization and follow-up in which the students participate during the three latter stages. A very practical and sound teaching illustration is given in connection with the use of a film on the use of the typewriter.

**How to Use Audio-Visual Aids: Part 2. Flat Pictures, Charts, Posters, Blackboard, Field Trips**—Elizabeth Goudy and Lt. Francis W. Noel, USNR—*Business Education World*, 24:201 December, 1943.

The pattern of use suggested in the preceding article should be applied to the use of other types of teaching aids that are very helpful to good learning. Flat pictures may be selected and mounted with student assistance. One technique would be to display a series of pictures singly on a bulletin board, so that each picture receives adequate attention. Small pictures should be projected.

Practical experiences with charts and graphs are recommended, as an organizational chart of the class or a flow chart of steps in some process. As for posters, they can serve a useful purpose in pointing out good work habits for commercial students, especially if they use some humor in making the point.

Helpful hints are then given on the use of blackboard and the school journey.

**Films Aid Learning**—Carolyn Nunn, Los Angeles County teacher and Mrs. Laura E. Jones, Supt.—*Sierra Educational News*, December, 1943. p.11.

A group of second and third graders was shown a film on the motor police. Some preparation had been made by the listing of questions that might be answered in the picture, as the teacher had not previewed it. After the showing, there was a discussion of what had been seen and the film was shown a second time to help answer further questions which came up during the follow-up.

Booklets, charts and rules were developed as the result of this interest in the police service. Dramatic play came into the study and the children measured part of the playground to illustrate traffic rules and proper habits

**Films Stimulate Discussion**—William S. Hockman, Lakewood Presbyterian Church, Lakewood, Ohio—*Int'l Journal of Religious Education*, 20:8 December, 1943.

Film-forums were held during the summer with the combined intermediate and high school students at this religious school. Fifteen minutes were allowed at each session for discussion. Some films were found to be more provocative than others. Among the most successful were: "It's the Brain that Counts" a (a WCTU anti-alcohol film); "Peoples of Canada," "Toward Unity" and others.

The author concludes that films are useful for discussion, but: "There is a tendency for our audiences to have the readiness

of spectators rather than the readiness of learners. They tend to be passive, and in the mood for entertainment, rather than to be active and in the mood for inquiry and critical thought. This means that before the film is shown the audience must be managed in such a way as to lower its passivity and increase its alertness and mood for thought and inquiry. If this is not done, what would have been an educational experience will turn out to be just another picture show."

**The Three R's Go to War**—Major Paul A. Witty and Captain Wendell W. Cruze—*Progressive Education*, 20:365 December, 1943.

No small portion of the success of the army's program to teach reading quickly and efficiently to the illiterate enlisted men has been the use of specially prepared filmstrips that build up a vocabulary based on concrete, common experiences.

**A Cooperative Community Program at Manzanar (Cal.)**—*Education for Victory*, 2: no. 10, November 15, 1943.

The report of a project in vacation-time community education is described for the Manzanar Relocation Center where people of Japanese ancestry are housed. In a population of 10,000 hemmed into a mile square area, crowded living conditions provided a play problem especially during the summer vacation.

Schools in the community are used for various out-of-school groups and during the summer a program of all phases of education and recreation was developed for children as well as adults. Exhibits showing fine arts, science materials and war posters were prepared and were satisfactorily used in reaching adults, regardless of their educational background or knowledge of English. The report of the entire project credits the use of visual aids as an important contribution to the success of the program.

### RADIO

**FM Radio and the Schools**—James Lawrence Fly, Chairman, FCC—*N.E.A. Journal*, 32:269 December, 1943.

A summary of the official regulations regarding the allocation of FM channels for educational purposes. The five channels over the nation can accommodate all educational bodies that apply. The five are among the choicest channels in the spectrum; they adjoin the 35 channels set aside for commercial broadcasting. But unless educators make use of these channels it will not be possible to keep them open, as there is too much pressure from commercial sources.

**FM Radio in San Francisco Schools**—James C. Morgan, station KALW—*School Executive* 63:20 December, 1943.

A description of the broadcasting program now under way in San Francisco.

**Tracy, Superman et Al Go to War**—John K. Hutchens—*New York Times Magazine*, November 21, 1943. p. 14.

A description of the kinds of programs to which America's children aged 7 and up, are listening to from 5 o'clock on every week night. Most of the programs are serials, and the heroes have all been going through daring war exploits.

The article gives something of radio's point of view in the planning and execution of children's programs. There is some history of serials on the air, and then a list of the highly-qualified persons who are now in charge on the major networks of the programs suited to child audiences. Miss Josette Frank of the Child Study Association, for example, serves as consultant

# Which?

## Which One You Teach

Here is a JAM HANDY Slidefilm Kit-set to help you

Eight hundred and eighty-eight lighted pictures comprise the Jam Handy Kit-set on *Basic Electricity*. Each picture "talks to the eye" presenting information quickly and clearly. These 888 illustrations—drawings, photographs, diagrams, arranged in 12 slidefilms—help teach basic principles of electricity vividly and thoroughly.

**Fundamentals of Electricity** (PIT 101) is composed of lighted pictures, photographs, cross-sections, drawings and diagrams. This set of 1,581 pictures is correlated with Government PIT Training Outline 101—matching an appropriate slidefilm with each section of the Outline.

Such slidefilms help teachers carry heavy teaching loads and still do an excellent job of teaching—good teaching plus effective visualization equals success in getting understanding throughout the classroom.

**Easy to use**, technically correct and authoritative, these slidefilms provide a complete step by step

visual explanation of electrical principles.

Try these slidefilms in your classes: you may prove for yourself without charge, the value of either of these Jam Handy Kit-sets. Whether you are teaching Basic Electricity or Fundamentals of Electricity, mail the coupon below to learn how you can have a free ten day trial of the pictures you want in your classroom.

**THE JAM HANDY ORGANIZATION, Inc.** R 14  
**2900 East Grand Boulevard, Detroit 11, Michigan**

Please send without obligation full details on how I may try out in my classroom:

# NEW VICTOR 16mm SOUND PROJECTORS

Now available to Schools!

Delivery 60 to 90 days.

from

**SWANK MOTION PICTURES**

Attention: Ray Swank

614 North Skinker

St. Louis 5, Mo.

(Send for our big, new 16mm sound film catalog)

on the production of several serials. She is quoted as follows:

"I was never concerned that serials were terrifying. It was simply that they weren't good enough. Any good program, per se, is educational."

The children's serial, it is concluded, is harmless and often better than that. The writer then summarizes the kinds of programs that are preferred at different age levels: fantasies for the young ones and serials for those above 10. In a recent survey, children in 29 cities were asked to list their preferences. The Lone Ranger was tops for the 8-10-year group and the next seven in their preferences were adult programs. Boys of 11 to 12 ranked Lone Ranger low; girls at that age mentioned no children's programs, but preferred Mr. District Attorney, Aldrich Family, Bob Hope, and others.

A significant trend in broadcasting for young people is mentioned in the Voice of Democracy program on Sunday afternoons, given by Youth-builders for 10-16 year olds, in which children within that age range discuss current problems.

The radio specialists agree that American radio is not serving children best, and Miss Frank believes that we can only do so by offering programs on a juvenile level, with artistic integrity but containing also those elements of excitement, suspense, even horror and slapstick comedy which they so strongly demand.

## GRAPHS

**How to Make Graphs**—Paul V. West, New York University  
—*Nation's Schools*, 32:56 December, 1943.

Instructions with appropriate illustrations for making line and bar graphs. No consideration is given to the pictorial type of graph. The article does give some basic information and should be very useful in assuring the proper interpretation of statistics in graphic form.

## PERIODICALS

**Sight and Sound**, October, 1943. British Film Institute, London.

In "The First Ten Years" (p. 56), Oliver Bell of the British Film Institute reviews the history of that organization and its present activities. The Institute was established as the result of a report made to the British Institute of Adult Education on 'The Film in National Life', in which some kind of national film institute was recommended. Finances for this organization were proposed from the charity contribution tax that is levied on all Sunday movies, and is administered by the Privy Council.

The British Film Institute's governing body is made up of 3 representatives of the cinema industry, three of the educational world and three of the general public. The present chairman is Sir William Brass, M.P. The activities of the Institute include: serving as a clearing house of information on all subjects connected with the cinema; publication of a monthly Film Bulletin, in which theatrical films are appraised for suitability for young audiences, and teacher committees evaluate new educational films. As for the use

of films in schools, the Institute does not deny the value of other types of visual aids, but recommends films only when and as they are judged the most suitable medium. The Institute has attempted to direct educational thought from "whether" to "how to use films."

A ten-year plan for school administration of audio-visual aids has been proposed to the Board of Education. The Institute also publishes listings of films on various subjects, and advises on programming where requested.

Growing out of its responsibility for selecting films to preserve the history and art of the motion picture medium for the National Film Library, the Institute has promoted the film appreciation movement. From the films in the archives, a course has been prepared to give information and to develop an appreciation for the cinema. These films are circulated to schools teaching film appreciation.

"The Cinema in Latin America" (p.58) by Ramon del Castillo tells the inside story of the motion picture industry in the Latin American countries. Attendance at movies there has been estimated at 40 million a week. Most of the subjects shown are made in Hollywood, and the native productions come from Argentina and Mexico—the latter producing films of high artistic merit. In the bitter rivalry between the two countries the Hollywood movie makers have shown preference for Mexico by the method in which they ration raw stock, loan out film stars and so on. This is due to the decided pro-Axis bias of the Argentine movie industry and to the fact that Nazi films and Spanish Fascist films continue to be shown there, with official sanction.

The influence of Hollywood films on Latin American life can be noted in various ways. On the one hand American movies have helped in the emancipation of women; on the other they have helped to fan racial intolerance where none had existed previously, as in Brazil. An interesting point is made of the fact that the people prefer to hear an English sound track, with superimposed Spanish or Portuguese titles instead of the Spanish sound track that was formerly used.

"An Experiment in Pupil Appraisal" by Andrew W. Paterson (p.70) describes a study in evaluation using children's own reactions as a basis for judging films and their effectiveness.

The study was carried on with six films shown between September and January (pupil age-level not indicated), and the criteria for evaluation were those of the Scottish Council for Research in Education, "Pupil's Film Appraisal Form."

Some of the questions asked on this form are: record the main facts of the films in the order in which they appear; would you like to know more about this subject? Which part of the film would you like to have repeated? Which part is most uninteresting to you? most amusing? too long- too short? too difficult? Give your general opinion of the film in words; check your rating of this film as very good, good or poor.

The six films dealt with human geography and nature study. The only introduction to each film was the listing of guide questions to direct observation to important parts in the film. Five or six days later, the students were given the appraisal form to fill out. The results are briefly described in the article. Only a few can be mentioned here. Questions asked by the pupils seeking additional information were such as: What happened to the grain when it had been put in sacks and stored? and When do the trawlers leave, and in what month do they return? Where the pupils asked for a second showing of a film, it was seldom because the content had not been clear, but most often for the reason that the film had been very interesting and was worth repeating. The free expression of opinion by the pupils throughout the study revealed the large extent to which they are capable of critical discrimination where they themselves are concerned.

In analyzing the study, the pupils agreed that it had helped them to think for themselves, a desirable experience in education for democracy.

(Concluded on page 45)

*Exclusive!*

A SERIES OF 13 16 MM FILMS DEPICTING THE NATION'S STORY

"Women At Arms" is an inspiring tribute to American women in their work for Victory.  
Release date January, 1944

"Private Smith of the U.S.A." The dramatically moving story of Mr. Average Citizen shedding his "civies" for Khaki is the first in this new series "This Is America." Release date January, 1944

# THIS IS AMERICA

"This Is America"—our America vividly lived by "Private Smiths" in army camps, by women working at war jobs, by the big and little people of Boomtown, D. C. "This Is America" is a new intensely moving series of 13 films, which are for the first time being released in 16 MM sound films exclusively by Pictorial Films, Inc.

Produced by R.K.O. these highly informative movies achieve their purpose of being educational, instructive, absorbing in interest, plus the final requisite—*excellent entertainment*. Educators and other informed people will agree this combination proves effective in the schoolrooms of democracy.

"This Is America" is more than isolated motion picture shows. It's the intensely moving story of our nation and its people, its leaders, soldiers, defense workers, farmers: for *they* are America.

*New releases each month.* 16 MM prints available for long term lease for permanent film libraries, or on spot booking basis.

Write for free brochure which illustrates each of the thirteen subjects, and gives complete details.

PICTORIAL FILMS, INC.

Producers • MOTION PICTURE • Distributors

R. K. O. BUILDING (Radio City) NEW YORK

## RELEASE DATES AND SYNOPSIS OF THE SERIES

### FEBRUARY "ARMY CHAPLAIN"

See how Uncle Sam's great moral army operates.

### MARCH "BOOMTOWN, D. C."

The nation's heart and the big and little people who compose its pulsing blood.

### APRIL "AIR CREW"

A raw "boot" becomes a "flyer" in the great United States Naval Air Training Station in Florida.

### MAY "MEDICINE ON GUARD"

A doctor in a trailer combats a strange malady which strikes a defense town.

### JUNE "MERCHANT SEAMEN"

The thrilling saga of the men who keep our lifelines open on the high seas.

### JULY "LIEUTENANT SMITH"

Private Smith becomes an officer with all the excitement the Fort Benning School offers.

### AUGUST "PACIFIC ISLAND No. 43"

See our own Navy doctors and nurses fight an unrelenting war against tropical diseases on this tiny island.

### SEPTEMBER "BROADWAY DIM-OUT"

Meet magic, mysterious Broadway and its famous people and places.

### SEPTEMBER "ARCTIC PASSAGE"

Learn and watch how our men blazed a trail through the muck and mud of the North.

### OCTOBER "AGE OF FLIGHT"

From the Wright Brothers to Sikorsky's Helicopter is a big jump, but now you can see it.

### OCTOBER "CHILDREN OF MARS"

American social institutions fight the rise in juvenile delinquency in a tense, human film.

## Film Presents the Schools' Case

HOW technological developments resulting from the war, and the approach of the air-age is making, and will increasingly make new demands upon the schools of the Nation, is the theme of a new sound motion picture titled *Pop Rings the Bell*, which will be shown nationwide to special groups of tax-payers, civic societies, service clubs, parent-teachers organizations and others with the aim of securing better pay for teachers and of providing more adequate equipment and facilities for the schools in the postwar era. Sponsored by The National School Service Institute, this film was produced by the Jam Handy Organization of Detroit. 16mm. prints of this two-reel picture will be available for showings nationally in cooperation with school systems, educators, educational organizations and civic groups interested in bringing our schools up to the growing demands.

*Pop Rings the Bell* is dedicated "To America's future—the Youth of Today," and is primarily directed to the American tax-payer whose dollars sustain our educational system, yet who so frequently fails to realize that teaching today is no longer a mere matter of text-book study and home-work assignment; that technology, upon which the future so largely relies, demands more adequate equipment for schools and that the successful application and use of this modern equip-

ment depends largely upon skilled teachers. The film brings out these points, in the simple story of a typical school in a typical American community, whose principal, Mr. Forsythe, is fully alive to the new responsibilities of his teaching job. The central figure in the story is "Pop" Gregor, the school's custodian, a well-known old-timer in the town.

Opening scenes in the principal's office on the evening of a "back-to-school" gathering show Mr. Forsythe confronted by four typical local tax-payers who question the request for more school taxes, and demand reasons for a larger school operating budget. He presents the case of the school's new and growing responsibilities dramatically and convincingly. "Pop" steps into this somewhat stormy scene to break down the viewpoint of the taxpayers by recalling what the Middleton School has done for all of them over the years. The meeting is the main episode in the picture, reflecting realistically a very common conflict of viewpoint between educator and tax-payer.

The gist of Principal Forsythe's "defense" may be summed up this way. Students of today face new problems in living and earning in the coming age of air-travel, television, electronics and plastics, and it is up to the schools of the community to prepare them for the new kind of world to come. Such an educational program demands modern and adequate physical facilities in classrooms and workshops, as well as highly qualified teachers who must be adequately paid. The investment in tax-dollars to improve education brings rich rewards to every one in the community.

The film contains impressive shots of students at work in the classroom, in the school shop, and in the domestic science department. Further information regarding *Pop Rings the Bell* and showing schedules can be secured from the National School Service Institute, Shop 307, Palmer House, Chicago, Ill.

LYNE S. METCALFE

Top: Class in global geography—new equipment essential.  
Bottom: Teaching is no longer a mere matter of text-books.

### Lockheed P-38

1 reel, 16mm sound. Available free from Lockheed Aircraft Corporation, Burbank, California.)

This is a vivid picturization of the newest model Lightning P-38, in color, with narrative and sound accompaniment. It is more than a thrilling exhibit of speed, manoeuvrability and tremendous climbing power of this famous fighter.

The film opens with scenes of pilot-training, the pig-a-back method whereby the trainee perches in the cockpit behind a veteran pilot. The gadgets of the elaborate instrument board are explained—the plane then starts down the runway—a perfect take-off—landing-gear retracted—air manoeuvres—guns in action. Then, assuming one engine shot away, one propeller stops, but the other continues with amazing efficiency to drive the plane, to bank, to climb, and return safely to base. With necessary preliminary training complete, the budding pilot repeats the performance.

The narrative is well managed, and avoids what is perhaps the gravest error in narrative, that of talking a continuous stream. Numerous pauses permit the spectator to reflect, observe, digest both picture and narration. The film is carefully calculated not only to portray the merits and performance of Lockheed's latest contribution to America's war potential, but to inspire confidence in the minds of all who view it that American flyers are prepared for their high service with the utmost attention to their safety as well as their ultimate efficiency when the great moments shall come. (Reviewed by N. L. G.)

The Office of War Information, Bureau of Motion Pictures

Presents

# THE DUTCH TRADITION

A NEW FILM OF HOLLAND and THE NETHERLANDS EAST & WEST INDIES

## A Timely Film of Lasting Importance!

THE DUTCH TRADITION is a comprehensive documentary film of our Allies, the people of Holland and the Indies: their background in time of peace, their contribution to our common fight against the Axis. It is an inspiring informational picture of the tradition of mutual progress through mutual endeavor.

THE DUTCH TRADITION portrays and goes beyond the Holland of tulips and windmills, cheese and wooden shoes. The film is distinctive for the clear presentation of the rise of modern Holland, its progress in industry and international relations. Nine times the winner of Nobel Prizes, the Dutch have also created something that is an outgrowth of their culture: a moral strength. That is the "Dutch Tradition". The people who reclaimed large areas of farm-land from the sea by bloodless conquest, also contributed to the founding and growth of America. THE NETHERLANDS EAST INDIES are presented in a colorful exposition of the varied peoples, cultures and industries of these vital islands. The 70 million people of Java, Sumatra, Borneo, Bali, Celebes and 3,000 smaller islands, take an active part in the community life. The native arts and crafts are pictured; also the industries of world strategic importance: tin, oil, rubber, rice, spices and quinine.

THE NETHERLANDS WEST INDIES, still free to carry on the fight against the Axis, are a rich combination of modern industry and ancient island culture. Here, oil from Venezuela is refined in Aruba and Curacao; bauxite from Surinam supplies aluminum for planes. Dutch and U. S. troops stand guard.

### UTILIZATION

This film is a visual aid of lasting importance because it provides an integrated background for better understanding of the Netherlands and its international relations. This basic background, together with the portrayal of the Netherlands Fighting Forces all over the world, and the Dutch resistance at home, are combined in a United Nations film of stimulating impact.

THE DUTCH TRADITION should be shown at all types of meetings and rallies to aid the winning of the war. It is also ideally suited for classroom and assembly use. Wherever it is shown it will contribute to appreciation of, and closer relations with, our Dutch Allies.

### G.I. MOVIES

THE DUTCH TRADITION has been selected for use by "G.I. MOVIES" for the United States Armed Forces abroad and at home.

Directed By JOHN FERNO

Produced by Mr. Ferno in cooperation with the Netherlands Information Bureau and The National Film Board of Canada.

STEREOPTON

● Forced-Air Cooled

- Takes up to 1000 Watt Lamps
- Choice of Lenses
- Pre-Focus Socket Aligns Filament on Optical Axis
- All-Steel-Welded Structure
- Built-in Tilting Device
- Fully Adjustable Bellows

Above items Are Available Now on Proper Priority for:

Educational Institutions  
—Army and Navy—  
Maritime bases—Lend-  
Lease—War Industries—  
Government Agencies—  
Medical Profession, etc.

Developed to meet today's needs in training centers and schools. Cooler-operating . . . for long projection distances. Shows standard stereopticon slides. Has powerful but quiet high speed motor. Three ground and polished lens furnished. 30" long overall. Conveniently portable.

in Audio-Visual Education**

(Continued from page 28)

Finally it was considered advisable to include two other questions to which the data gathered in connection with the other questions might help give an answer. These two questions were:

19. Do pupils believe a class discussion or a study period would enable them to understand films better?
20. Is the wide grade span for sound films usually recommended by producers justifiable?

**Procedure**

The data gathered to answer these questions were gleaned from a careful analysis of the verbal accompaniments to the films (word count, and analysis of sentences and the administration of especially constructed tests to 640 pupils from 22 classes ranging in grade levels from four through twelve. The pupils were selected from three schools located in Evansville, Indiana. The pupils may be said to be of average intelligence and having average educational opportunities.

The eight sound classroom films used in the study were the Erpi films: *Theory of Flight*, *Problems of Flight*, *Sunfish*, *Growth of Cities*, *Westward Movement*, *Chile*, *Brazil*, *China*.

**Conclusions**

In so far as these data were adequate and accurate, the following conclusions seem valid.

1. Only a minority of the pupils believe that easier words would make films easier to understand.
2. All of the children do not know all the difficult words. They do learn some of these difficult words from viewing a film once. The lower grades made the most gain in vocabulary. Pupils are more likely to learn the words that are illustrated or defined in the films.
3. Words on which the various groups participating in this investigation made the most improvement were from the upper levels of the Thorndike list rather than from the lower levels.
4. Pupil interest in films corresponds rather closely to mean vocabulary level of films. Interest in films and gain in vocabulary are apparently not closely related. Interest in films and gain in content are closely related.
5. Children gain a fair understanding of films from one viewing. They seem to learn content of films. This is particularly true for the lower grades.
6. There is apparently a close relationship between sentence length in films and gain in knowledge of subject matter being presented. Likewise there is a close relationship between mean vocabulary level of films and gain in knowledge of content.

## FEATURES and SHORTS

GUTLOHN selected and approved Films have won the confidence of teachers and administrators throughout the nation.

Whether for classroom or auditorium use, grade school or college, GUTLOHN motion pictures meet individual requirements for subject matter and audience appeal.

We wish to thank the many educators through whose kind cooperation we have been able to maintain a high standard of service.

A new low price will shortly be announced on the "STRUGGLE TO LIVE SERIES" an outstanding group of scientific films.

*Walter O. Gutlohn Inc.*  
ENTERTAINMENT SOUND FILM SILENT EDUCATIONAL

25 West 45th Street Dept. E-1 New York 19, N. Y.

- The vocabulary burden of films does not seem excessively heavy. The vocabulary of some films could, however, be reduced in the interests of learning.
- The sentences used by the narrators in verbal accompaniments seem long and probably should be shortened where feasible.
- Pupils seem to think that farther study and class discussion on films would lead to a better understanding.
- The grade placement recommendations of producers does not seem to be too wide.

These conclusions have certain inferences for teachers.

These are:

- Films contain many words not known by pupils. These words, wherever it seems advisable, should be explained and defined for children. This of course presupposes that teachers will preview films before showing them.
- Pupil interest seems closely related to the mean vocabulary burden of a film. If pupils show a disinterest in a film it may be due to its vocabulary being too difficult.
- Pupils believe that further study and class discussion would give them a better understanding of the films. Teachers should therefore relate films to classroom work and use them as a teaching device. If a classroom sound motion picture is worth showing it is worthy of study and discussion.
- Reliance upon pupil belief of vocabulary burden seems undesirable.
- The wide grade placement of films seems justifiable.

Hints to producers.

- Films with long sentences and a heavy vocabulary burden are the films from which pupils seem to learn the least.
- Interest appears to be higher where the vocabulary burden is not too heavy. Children learn most from the films in which they are most interested and which have lower mean vocabulary burdens. The use of the mean vocabulary is suggested as a means of checking the

vocabulary burden of a film and in turn related teaching value.

- Films contain words which are difficult for pupils. The number does not appear to be great. However, a simplification of vocabulary in certain films, where a sacrifice of meaning will not result, would appear wise.
- The sentence length of the verbal accompaniments to films seem long. Children learn most from films with short sentences.
- If it is the desire to teach a word, the word should be defined and illustrated.

## AUDIOFILM STUDIO

### PRIZE MOVIE-IDEA CONTEST

you may win **\$50.00** and wide publicity

For the Film Outline selected by our Production Staff

**ANY** member of the teaching profession may enter their outline for a movie to be produced by Audiofilm Studio for school showing

**SUBJECT** curricular or non-curricular in substance. It will be judged on wide appeal, long term value, originality and production feasibility.

#### Rules:

- Give a DETAILED OUTLINE of a movie you would like most to see made for the school screen. It may become a reality.
- Only one will be selected from this contest. You may send more than one idea.

## ONE OF THE GREAT BATTLE PICTURES OF THE WAR

➔ *Desert Victory* is a British documentary sound film made under fire. It captures the full impact of modern warfare, and dramatically records the British Eighth Army's smashing victory at El Alamein and its triumphant 1300 mile advance across the desert to Tripoli.

➔ *Desert Victory* shows how the Royal Engineers went ahead to clear the deadly mines, the vital part the General Sherman tanks played and how the infantry, the armored divisions, and the air force worked together to shatter Rommel's best Panzer troops.

➔ Produced by 26 battle photographers and six officers, *Desert Victory* cost the lives of four cameramen, while seven were wounded and six captured.

➔ Progress and tactics of the battle are shown by means of maps and commentators.

Sale price \$66.50 • Rental \$2.50 • 62 mins.

### Northwest Panels on Visual Education

The Idaho Conference of the Northwest Society of Supervision and Curriculum Development, which was held at Lewiston State Normal School October 26 and 27, included a Panel on the topic "Utilization of Visual Education," in which visual educators from several Northwest states participated.

The recommendations drawn up by the group are summarized briefly as follows:

(1) Wider use of the simpler audio-visual aids.  
(2) Endorsement of the statement of McKown and Roberts: "Although there are departments of, and courses in, audio-visual instruction, yet in its applied form it is not a subject separate from the other subjects of the curriculum. Like composition, it has no content of its own. It permeates all instruction."

(3) Appointment of a director of audio-visual aids in each school system.

(4) Only methods of good teaching and careful preparation be recognized.

(5) Courses in audio-visual instruction at the pre-service level or, at least, use of audio-visual aids in teaching subject matter courses, or instruction in their utilization in established methods courses.

(6) Use of the motion picture as a teaching tool—not a fad or frill to be used as entertainment.

(7) Development of larger collections of basic materials for an audio-visual program by both central visual aids libraries and individual school systems.

(8) Reports to the community and parents particularly on use of audio-visual aids in the schools.

(9) Listing of appropriate audio-visual aids in bibliographies of curricular materials.

A similar Panel was conducted at the Western Washington Conference of the Society, November 1 and 2 in Seattle. Their recommendations largely duplicated those adopted at the Idaho Conference. In addition, however, it was recommended that the State Department of Public Instruction appoint a state committee to supervise and develop audio-visual aids in education, as leadership is essential to a well balanced and coordinated state wide program for visual teaching.

### Projector Requirements Proposed by Teachers

To aid equipment manufacturers in the production of the type of school projectors which will be needed when the war is won, the British Film Institute called together a group of practicing English teachers, education authorities and members of film advisory committees to consider and formulate suggestions as to the characteristics which school projectors should possess. The conference was of the opinion that three distinct types of apparatus are necessary for use in schools and other educational establishments: (1) a silent projector for general classroom use, but capable of being used also in large lecture rooms; (2) a sound machine of

# Notes

semi-portable type for use in classrooms, lecture rooms and small halls; (3) a sound machine of larger dimensions for semi-permanent installation in a projection room of a large hall.

Features of projectors which came under discussion included: controls, mechanical noise, portability, running speed, intermittent drive, threading, inching device, focussing, framing, still device, light output, pilot light, transformer, reverse, rewind, levelling and tilting, trip device, accessibility, accessories, lubrication, and spools.

An 8-page pamphlet containing this information in condensed form titled "The Design of Projectors for Educational Purposes," has been issued by The British Institute, 4 Great Russell Street, London, W.C.1.

## State Department Plans Post-War Film Education

The December 4th issue of *Motion Picture Herald* reported on the plans which the United States Department of State is considering for the use of films in the post-war education of the peoples of occupied Europe and enemy territories. There are indications in Washington that there probably will be a permanent film official appointed to function under the Secretary of State, who would be concerned with both the commercial entertainment film and special, Government-financed, educational pictures. Such films as those on health, medical care, child care, nutrition, agriculture, home and factory construction, would be particularly needed to aid in the rehabilitation of Europe.

The motion picture industry, it was indicated, would produce the films suggested by the State Department and the department would handle the distribution through diplomatic film attaches stationed in the various countries. This may be accomplished through expansion of the work of the Department's present Division of Cultural Relations and the attaches now abroad, or, perhaps, an entirely new film organization would be set up.

Ralph Turner, assistant to Charles R. Thompson, chief of the Division of Cultural Relations, has returned from London, where he spent two months conferring with British officials and other United Nations leaders for the preparation of a special report on post-war education. This report will be part of a general survey the department is making of cultural media for the post-war period.

The recent appointment of Dr. Grayson N. Kefauver, dean of the School of Education of Leland Stanford University, as a special adviser on educational reconstruction, is a further step in the development of the government's contemplated visual education program.

## New Company May Take Over CIAA Film Work

A new, non-profit organization, Hemisphere Films, Inc., has been formed by Nelson Rockefeller to take over the functions of the motion picture bureau of the Coordinator of Inter-American Affairs should that agency be abolished by the Government. Such action is

anticipated in many quarters, after the caustic criticism of the cultural relations program of the CIAA by Senator Butler and other members of Congress, as a result of which a Senate Committee will investigate the expenditures and film program of the CIAA.

**Connecticut Audio-Visual Conference**

Members of the Connecticut Audio-Visual Association assembled in Stamford Saturday, December 11, to enjoy the following program:

Address of Welcome—Leon C. Staples, Superintendent of Schools, Stamford.

Introduction—Joseph Senechal, President, Connecticut Audio-Visual Education Association; Windham High School, Willimantic.

"How to Use War Films in Schools"—Edward F. Wheeler, Director of Audio-Visual Education, Bristol (Illustrated by showing of recent war films).

"New Films for English and Social Studies Classes"—Roger Albright, Teaching Films Custodians. (Showing of classroom version of "The Good Earth")

"The Use of the Filmstrip or Slidefilm"

"By the Office of War Information"—J. Raymond Hutchinson, Filmstrip Division, OWI (Showing of filmstrips distributed abroad by OWI).

"By the Classroom Teacher"—Karl Detchart, demonstrator of the Jam Handy Organization.

Program Chairman—Hardy R. Finch, High School, Greenwich.

**Overseas Film Showings to Troops**

According to a recent survey by Army officials, an average of 630,000 men in uniform nightly attend the free showings of new Hollywood features in combat areas abroad. This means that 95 per cent of the men overseas are seeing movies regularly, some three or four times weekly. 16mm. prints of the films are donated to the War Department by the motion picture industry and represent the top "A" films from the major companies. Many of the pictures are seen by the troops before release in the U. S.

Since the beginning of this service, in February, 1942, over 8,500 prints of approximately 300 film titles were delivered to the Overseas Motion Picture Service of the U. S. Army to be flown abroad to the 19 exchange points for distribution to combat areas, where they are seen by Army Service ground and air units, Navy and Coast Guard Personnel, Merchant Marine units, Red Cross and U.S.O. workers. The number of projectors in use overseas has increased from 370 to 2,500. The distribution points are located in Persia, Algiers, Egypt, African Gold Coast, England, Iceland, Greenland, Labrador, Newfoundland, Trinidad, Bermuda, Panama, Alcan Highway, Alaska, Hawaii, Fiji Island, New Caledonia, Australia and India.

**Depth Pictures Speed Up Navigation Training**

Military navigation students are now being trained by a new technique which teaches them more quickly than ever before to steer by the stars. The new method eliminates the need for training students to interpret depth in flat charts and diagrams by presenting life-like pictures of models of the heavens and the earth in three dimensions. Recently perfected by Professor John T. Rule, Chairman of the Section of Graphics at the Massachusetts Institute of Technology, the speedup technique is made possible by Polaroid three-dimensional pictures known as vectographs.

Prepared as slides for projection by standard projectors on a classroom screen, the vectographs are so strikingly realistic that an instructor walking into the beam of a projected vectograph of the earth appears actually to be walking into the center of the earth. Students feel they are looking at precise wire models of the heavens with relative positions of the stars and the earth immediately apparent. The technique of preparing three-dimensional projection slides of the heavens is similar to the geometry instruction technique developed by Professor Rule in 1934. According to Professor Rule, "Everything else being equal, a student trained with celestial navigation vectographs is bound to learn more readily about navigation than one trained only with the aid of ordinary flat diagrams."

In the old days, a stereoscope was the only prac-

tical three-dimensional viewing device. It permits, however, only one person at a time to view a picture in three dimension. A three-dimensional vectograph, projected on the screen, can be viewed even by a large group of people simultaneously.

The vectograph process is the invention of Edwin H. Land, President of Polaroid Corporation, and Joseph Mahler. A three-dimensional vectograph is a specially treated plastic sheet. On it, two pictures occupy the same space at the same time. Polarizing three-dimensional viewers unscramble the superimposed pictures to recreate the normal condition of effortless three-dimensional seeing.

**Schools-at-War Bulletins**

The Education Section of the War Finance Division, United States Treasury, publishes a quarterly War Savings News Bulletin titled *Schools-at-War* as a teaching aid to promote the program of the War Finance Division throughout the schools of America. These bulletins, which are distributed free of charge to teachers through School Superintendents, provide sales suggestions and study guides for a good War Savings program.

Other free material, including bulletins, leaflets, posters and filmstrips, will be sent to teachers who write in to their State War Finance Office. A list of the state offices appears in the current sixth News Bulletin—the Fourth War Loan Issue of *Schools-at-War*—dated February.

## Current Film News

■ **BRITISH INFORMATION SERVICES**, 30 Rockefeller Plaza, New York, have announced the non-theatrical release in 16mm sound of the official British Army film, titled:

**Desert Victory**—an outstanding factual film on desert warfare, which has evoked enthusiastic praise from the press and audiences wherever shown, being hailed as "the greatest war film produced," and "a model for battle pictures that will be followed for a long time to come." The film covers the battle in Africa from the point when General Auchinleck made his stand sixty miles west of Alexander, to the end of General Montgomery's victorious advance against Rommel's Panzers from El Alamein to Tripoli. The highlight of the picture is the battle of El Alamein, when the full weight of British armor, which had by then been supplemented by American equipment, was thrown against Rommel's lines.

"Desert Victory" was produced by soldier cameramen who fought and marched with the Army on the 1300-hundred mile trek. The actors are the common British soldiers, but there are one or two star names. Winston Churchill appears at the beginning and end of the film. Unwilling actors are Field Marshall Rommel, Adolf Hitler, Goebbels, and captured German generals.

Colonel MacDonald, who was in charge of the film, returned to England with nearly 200,000 feet of film made by his unit, and some captured German film. With this material and some footage of munition making activity in Britain and the United States, Colonel MacDonald cut, shaped, and edited the final 5400 feet of "Desert Victory." Some of the cameramen did not live to see their work. Four were killed, seven were wounded, and six were captured.

■ **FRITH FILMS**, P. O. Box 565, Hollywood, Calif., have produced the following two films on farming which are valuable additions to the list of films contributing to the war effort. (Each is one reel sound and color.)

**Farming Takes Skill**—a general film on farm work that gives a well-balanced picture of modern, scientific farming. Several crops are shown through an entire year. In addition to presenting factual information, attention is given to such farm problems as management, scarcity of labor, and conditions that influence food prices.

**A Teen Age Farm Hand**—a sincere picture of wholesome farm life, designed to interest young people. Farm chores take on a new appeal when viewed with the young hero Ken, a lovable efficient farm boy. He is seen taking care of the horses, tending chickens, cleaning yards, driving farm machines, milking cows, etc.

■ **CASTLE FILMS, INC.**, 30 Rockefeller Plaza, New York, continues to keep schools abreast of current history with the release of a special *News Parade* recording two significant events in the history of the world struggle.

The first story in this one film is of three days that will live in the history of the United States Marines and will bring home to all Americans with stark realism an appreciation of the terrific struggle that took place in the recent capture of the Gilbert Island Jap base at Tarawa. The film story of Tarawa is complete, from the naval and air bombardment that preceded the assault and the actual start of the landing boats from the off-shore convoy, to the struggle for the beach and the final triumph of the American forces. The cameramen have shown complete disregard for their personal safety in filming this epic battle. The scenes they have provided give this *News Parade* a dramatic and historic thrill such as film audiences have seldom experienced.

In contrast to the fury and thrill of battle, the second story in this one film pictures the calm but immensely important and history-making conferences of the great powers in Egypt and Persia. Collectors of *News Parades* recording the complete story of this war will regard this chapter as one of their most important records. Events certain to ensue as a result of these two conferences will spotlight them as developments which have shaped the course of world affairs for generations to come.

■ **HARMON FOUNDATION, INC.**, 140 Nassau St., New York, has produced a series of two-reel 16mm silent films on the Arts and Crafts of Mexico, covering:

**Black Pottery or Black Earth of Coyotepec**—portraying the primitive methods by which the pottery is formed by hand.

**The Painted Pig** (in color)—demonstrating the origin of Mexican art in the lives of the people. The film follows the artist's step in making the pig.

**Uruapan Lacquer** (in color)—showing in detail the techniques of making the ancient lacquer ware of the Tarascan Indians at Patzcuaro.

**Puebla** (in color)—how the skilled Indian potters of the region of Puebla copy the glazed Talavera pottery of the Spaniards; examples of finished tiles.

**Red Pottery of Tzintzuntzan**—where pottery-making is a family affair. The process is followed step by step—treating the red clay, forming over a clay mold, polishing, and applying the design with pigment made from ground stones or burned wood.

■ **BRANDON FILMS, INC.**, 1600 Broadway, New York, announces the release in 16mm sound film of the Russian documentary film:

**Black Sea Fighters**—a 65 minute production, narrated by Fredric March. This feature is the actual story of the Russian Black Sea fleet's 250-day defense which turned Sevastopol into a graveyard for Hitler's hopes of world conquest. It is the first comprehensive full-length documentary of Naval warfare to be released by any of the United Nations.

■ **COMMONWEALTH PICTURES CORPORATION**, 729 Seventh Ave., New York, has again been appointed exclusive distributor for a new series of six Walter Wanger productions in 16mm sound, featuring top-flight Hollywood stars. These features are:

**Foreign Correspondent**—starring Joel McCrea and Laraine Day. This is an exciting drama of intrigue, directed by Alfred Hitchcock. The story concerns the thrilling adventures of an American reporter in Europe.

**Winter Carnival**—with Ann Sheridan and Richard Carlson co-starred in a gay college romance which is unfolded against the vivid background of the famous Dartmouth College festival, highlights of which are winter sports contests, the selection and crowning of the Queen of Carnival.

**Eternally Yours**—starring Loretta Young, and David Niven.

**Trade Winds**—with Fredric March, Joan Bennett, Thomas Mitchell.

**Slightly Honorable**—with Pat O'Brien, Edward Arnold, Ruth Terry.

**The House Across the Bay**—featuring George Raft, Joan Bennett, Walter Pidgeon.

This series may be ordered from either Commonwealth, who control exclusive world-wide 16mm rights, or from many commercial film libraries.

■ **CHICAGO FILM LABORATORY, INC.**, 18 W. Walton Place, Chicago, has prepared a two-reel sound film of the 1943 World Series Baseball Games, in cooperation with Lew Fonseca, Promotional Director of the American League of Professional Baseball Clubs, for distribution to America's fighting men all over the world, and to Army, Navy, Marine and Coast Guard bases in this country. After requirements of the Armed forces have been met, additional prints of the film will be distributed to USO centers, hospitals and other places designated by the Army and Navy.

The picture presents highlights of the play-by-play, with many interesting close-ups of star players. It has been enthusiastically endorsed by the various Government departments concerned with its use. Requests for this free film should be addressed to the American League of Professional Baseball Clubs, 310 S. Michigan Ave., Chicago.

(Concluded on page 44)

# Teacher with SEVEN MILLION students

THE FILMOSOUND V . . . —  
is an example of the fine engineering you can expect from B&H when the war is won. This unit uses little critical material, yet it maintains traditional B&H performance standards.

No greater educational task was ever undertaken than the training of our Army and Navy millions . . . and never were motion pictures and Filmosound Projectors so widely and continuously used in teaching.

Visual education is proving itself every day . . . helping to turn out a war-smart fighting force . . . and the teaching technics that, today, are doing a grim job well, will add new power to education in peace.

Visual instruction grows daily in stature and vitality in civilian education, also. In war and peace, Bell & Howell's Opti-onics equipment and its Filmosound Library serve every motion picture need.

We have learned many things in our production for war. You've been waiting, patiently or otherwise, for a new B&H Projector . . . a new Filmo Camera . . . and we want you to know that *when* it comes, it will be worth the waiting.

Scene from a USOE Machine Shop Work Film, one of thousands of Filmosound Library subjects ideal for use in supplementing regular classroom work. Send for Catalog and Educational Utilization Digest.

\*Opti-onics is . . . OPTics . . . electrONics . . . mechanICS. It is research and engineering by Bell & Howell in these three related sciences to accomplish many things never before obtainable. Today, Opti-onics is a WEAPON. Tomorrow, it will be a SERVANT . . . to work, protect, educate, and entertain.

\*Trade-mark registered

### REMEMBER THESE ?

They're part of the most complete line of motion picture equipment in the world . . . the line most users say is the world's finest. After Victory it will be even better . . . improved by all we've learned in meeting and surpassing rigid military standards.

PRECISION-  
MADE BY

*Bell & Howell*

■ **BELL & HOWELL COMPANY**, 1801 Larchmont Ave., Chicago, report that a group of educational films produced and heretofore distributed by the University of California, will henceforth be rented and sold through the Film-sound Library. Included in the group

A scene from "The Horse in North America"

are some of the most significant school-made films, dealing with widely varying subject matter. This list includes:

**Nursing—A Career of Service**—28 min., silent—step by step progress of a student nurse. Available in color or black-and-white.

**Springboard Diving**—10 min.—Champion mermaids demonstrate all the standard competition dives in normal and slow motion sequences.

**Technique of Foil Fencing**—15 min., silent—expert instructors demonstrate classic movements of offense and defense. The importance of poise, form and agility in this sport.

**Making a Stained Glass Window**—20 min., sound and color—a comprehensive and beautiful process film showing each step in the making of large stained glass windows, using American materials and craftsmanship.

**The Horse In North America**—20 min., sound and color—the natural history of the horse on the North American Continent, reconstructed by University of California scientists from preglacial fossil remains.

**The American Horse**—21 min., color and sound—outstanding representatives of all leading breeds, their pedigrees and functions. Excellent complement to "The Horse In North America."

■ **AMERICAN RED CROSS**, 40 East 49th St., New York, is booking a new film on the Junior Red Cross through its Motion Picture Distributing Office, under the title:

**Hand in Hand**—1 reel, 16mm and 35mm sound. The picture tells what the Junior Red Cross is and does. Prints are loaned for one week, free except for express charges. The film may be purchased from the William J. Ganz Company at the same address.

■ **RADIO CORPORATION OF AMERICA**, Camden, New Jersey, is distributing a film portraying radio's dramatic part in this global conflict, with the title:

**Radio at War**—a 24-minute presentation on 16mm sound film, picturing the adventures of two typical American boys, Jim and Joe Brown, who leave high school shortly after Pearl Harbor to join up, Jim entering the Army Signal Corps and Joe the Navy, where he likewise finds himself in the communications section.

Training camp routine is pictured in detail, followed by scenes taken at actual maneuvers during which many phases of electronics communications are brought into play. A high point of the film is the sequence of recent official Army and Navy motion pictures of an invasion in the southwest Pacific and the establishment of a beachhead, with authentic battle scenes adding to the exciting portrayal of radio's vital part in the operations. Final scenes show Jim Brown, on the beach with his Army Signal Corps outfit, contacting a warship at sea, relaying information on the battle ashore, and the message being received aboard ship by his brother, Joe.

The film may be obtained by schools, colleges or civic groups upon payment only of transportation charges. Requests may be addressed either to the Educational Department of RCA Victor Division, Radio Corporation of America, Camden, N. J. or the William J. Ganz Co., producers of the film, 40 E. 49th St., New York City.

■ **U. S. NAVY DEPARTMENT** has released eight motion pictures in 16mm sound, dealing with office practices, to the U. S. Office of Education for distribution to schools, business organizations, and others engaged in the training of typists and stenographers. The films were produced by the Training Film Unit of the Bureau of Aeronautics for the Division of Personnel, Supervision, and Management of the Navy Department. There are four films on typing, two on machine transcription, one on dictation, and one on the maintenance of office machines.

"Fortress of the Sky," a three-reel 16mm color film, telling the inside story of the spectacular Boeing Flying Fortress, is ready for distribution from the producers. The Princeton Film Center, Princeton, New Jersey.

The Boeing B-17E Fortress is shown here on the airport "apron" at Boeing's Seattle factory.

The films dealing with typing are:  
**Basic Typing Methods**—31 min.—the history of typewriter development; various kinds of machines now in common use, and principles of keyboard.

**Basic Typing. Machine Operation**—29 min.—correct touch and relationship of touch to typing speed; various parts of the typewriter.

**Advanced Typing. Shortcuts**—26 min.—How to insert carbons, and make corrections; some time-saving methods.

**Advanced Typing. Duplicating and Manuscript**—37 min.—cutting of stencils and techniques to be used in typing manuscripts.

This group of eight films brings to 66 the number of motion pictures released by the Army and Navy for civilian use. There are also 70 filmstrips available. A list of these visual aids may be secured from either Castle Films, Inc., 30 Rockefeller Plaza, New York, contract distributor for the Office of Education, or the Division of Visual Aids, U. S. Office of Education.

■ **THE NATIONAL FILM BOARD OF CANADA**, with headquarters for non-theatrical distribution in the U. S. at 84 East Randolph Street, Chicago, announces that sixteen American universities now have well-stocked libraries of recent Canadian releases. These documentary films, presenting Canada at war and as a nation, are available in 16mm. sound to schools, churches, clubs, civic organizations and adult study groups at a nominal rental.

Schools and organizations interested in utilizing these films in their United Nations programs may apply to the Departments of Visual Education in the following universities: University of California, Berkeley; University of Connecticut, Brigham Young University, Provo, Utah, Pennsylvania State College, University of Missouri, Oregon State College at Corvallis, University of North Carolina, University of Michigan, University of Nebraska, University of South Carolina, Central Washington College of Education at Ellensburg, University of South Dakota, Iowa State College at Ames, University of Oklahoma, New York University, Indiana University.

**The Literature in Visual Instruction**

(Continued from page 32)

**SOURCES OF INFORMATION**

**Approved Films on Food and Nutrition**—Committee on Evaluation of Motion Pictures, New York City Food and Nutrition Program, 45 Lafayette St., New York, 13, N. Y. 44p, 25c. 1944.

A highly selective catalog of forty-six films on food and nutrition that have met the Committee's criteria, out of some 100 reviewed. The films meet the standards of accuracy, organization of subject matter, quality of presentation and educational value.

Among the topics included in the list are general nutrition and child care; nutrition in wartime; industrial feeding; school lunch programs; servicemen's diet; apple industry; banana industry; citrus fruit industry, etc.

**Lists of Motion-Picture Films and Other Visual Materials for Instructional Use.** *Education for Victory*, December 1, 1943.

A master list with the most recent information on books and sources of audio-visual aids, prepared by the U. S. Office of Education. The bibliography includes lists of films on safety education, health, conservation, world geography, and the war. There are also catalogs of films for the use of special groups, such as vocational and technical schools, High School Victory Corps programs, churches, and the community in wartime. Suggestions concerned with making films and with projection are also included among the references.

**Let's Help You Find it:** recordings for classroom use—Emily Haley—*Progressive Education*, 20:263, December, 1943.

A classified listing of recordings for sale and rental in both 33 1/4 r.p.m. size and 78 r.p.m. for use in high school social studies, English and drama.

**California's Film Library Catalog**

The Department of Visual Instruction of the University of California, Extension Division, has recently moved into more spacious quarters and has issued its annual catalog in appropriately new and striking format.

In contents, the 336 page volume gives, in complete, clear and ready-reference form, the customary data needed by the schools for getting full benefit from the Department's service. The four principal sections of the book are: Introduction. Explanations, Directions (15 pages), Subject Index of all Films by single line Titles (60 pages), Detailed Descriptions of all 16mm Silent Films (60 pages), Detailed Descriptions of all 16mm Sound Films (200 pages). Subjects which have Teaching-Film-Manuals to accompany them are listed separately.

In appearance, the book is distinctive. Its title, "Lifelong Learning," emphasizes the "permanence" of visual teaching over the more familiar argument of "speed." The heavy paper cover is a gay, warm red that attracts the eye and invites the hand. An original touch is the subtitle consisting of two verbs, each given in four languages—"I see (Io vedo, Yo veo, Video), I understand (Io capisco, Yo entiendo, Scio)—a departmental slogan ingeniously reminiscent of Descartes' famous "Cogito ergo Sum." The paper stock is excellent for these priority days, type size and type faces are well chosen, and page arrangement, with plenty of "white space," makes reading reference a real pleasure.

## Kodachromes on Life of Lincoln

A new set of twenty Kodachromes, *Highlights in the Life of Lincoln*, complete with teacher's manual, has been announced by the Society for Visual Education, Chicago. Each Kodachrome—a 2" x 2" miniature slide—is a scene from the Lincoln Dioramas, which were executed by the Museum Extension Program of Illinois. These include subjects selected by the Chicago Historical Society in collaboration with a group of eminent Lincoln authorities.

The dioramas from which these color slides were made are the result of three years of work by fifty skilled craftsmen. Six thousand tiny figures, varying in size from one-half inch to nineteen inches, are included in the dioramas. A few of the scenes depicted are the migration of the Lincoln family to Illinois in 1830; Lincoln waiting on Ann Rutledge in his store; the Freeport debate in 1858; and the Gettysburg address in 1863. The accompanying manual explains the fine points in the construction of the dioramas, and the historical background and sequence of events.

This set of Kodachromes would be valuable addition to any Lincoln collection. In addition, it is especially fine for use in teaching the history of that period in American history. A complete list of scenes and other pertinent information will be furnished upon request to the Society of Visual Education, Inc., 100 East Ohio Street, Chicago, 11, Illinois.

## Westinghouse New Manager

The appointment of Charles W. MacLean as manager of the School Service Department of the Westing-

house Electric & Manufacturing Company was announced recently. He succeeds R. E. Williams who will devote his full time to technical and research activities.

A native of Bloomfield, N. J., Mr. MacLean has served as an educator in New York State secondary schools for the past twelve years. He was head of the English department of the Union, N. Y., High School from 1931 to 1932, leaving that post to become supervising principal of the Verona, N. Y., High School. From 1936 until assuming his present position he was supervising principal of the Oriskany, N. Y., Central School and later of schools at Locust Valley, Long Island. Mr. MacLean is a member of the National Education Association, the New York State Principals Association and the New York State Council of School Superintendents.

## Radiant Publishes Army Brochure on Film Use

*The Army Uses Training Films* is the title of an amusing and practical brochure which Radiant Screen has made available for the benefit of those who are using films as teaching and training aids. This booklet tells how to use training films most effectively as well as how to get faster and better results with such films in all activities. The information is based on actual experience accumulated during the past year by an officer of the U. S. Army Signal Corps who originated the booklet, and is illustrated with many humorous cartoons.

Radiant Manufacturing Corp., 1144 West Superior St., Chicago, has reproduced *The Army Uses Training Films* by special permission of the Signal

Corps and has distributed over 12,000 copies of it. War agencies, government departments, army camps, training schools, colleges and universities, and war factories will find it worthwhile to secure a copy of this brochure. It is available without charge, and sent upon request only.

## Slidefilm Series on Physics-Mechanics

The Jam Handy Organization, Detroit, Michigan, announces a Kit-set of 15 discussion-type slidefilms, *Air Age Physics—Mechanics*, designed to help the instructor give his students a usable understanding of the principles of physics. These slidefilms establish a visual and mathematical relationship, between the fundamental principles and their practical application. The units of instruction contained in each film are complete within themselves, and the sequence of subjects can be arranged to suit any curriculum.

The 15 subjects in the series are: "Matter," "Units of Measurement," "Force," "Force and Velocity as Vectors," "Uniform Motion," "Uniformly Accelerated Motion," "Newton's Laws of Motion," "Gravitation," "Rotary Motion," "Centrifugal Force," "Work," "Energy," "Power," "Friction," "Simple Machines." A total of 842 individual pictures comprise the unit, ranging from 32 to 86 frames to a subject.

With the aid of these slidefilms the instructor with a limited laboratory can develop principles and formulas which only a heavy investment in lab equipment could otherwise provide.

## Visual Education, Inc., Opens Branch Office

Due to increased volume of business Visual Education Incorporated has set up a branch office in Dallas, Texas, located in the Gulf States Building. Headquarters office will remain in Austin.

## Absenteeism Cut By Serial Films

Ever since the "Perils of Pauline", serial film has been cutting absenteeism. For many years it brought people back to the theaters regularly, to see the next breath-taking chapter. Now it is up to *Flash Gordon*, along with *Riders of Death Valley* and other more modern serials, to bring the war workers back to work more regularly in the plants that are making recess movies a part of their regular personnel activities.

In the plants of Bell & Howell, the serials outshow any other type of film, the audience being double that which turns out for any other film. The serials are shown on Mondays and Tuesdays, usually the worst days of the week with regard to absenteeism. The absenteeism on these two days has been reduced by 14% in comparison with a 10-week average before the serials were introduced.

Film audience of war workers at the Bell & Howell plant.

# Additional Valuable Literature —

## “1000 AND ONE”—The Blue Book of Films

“1000 and ONE” The Blue Book of Non-Theatrical Films, published annually is famous in the field of visual instruction as the standard film reference, indispensable to film users in the educational field. The **CURRENT, NINETEENTH EDITION** lists and describes over 5,000 films, classified into 176 different subject groups (including large groups of entertainment subjects). A valuable feature is a complete alphabetical list of every film title in the directory. Other information includes designation of whether a film is available in 16mm, or 35mm, silent or sound, number of reels and sources distributing the films, with range of prices charged. 136 pp. Paper. Price 75c. (25c to E. S. Subscribers)

## FILM EVALUATION SUPPLEMENTS TO “1000 and ONE” under The National Film Evaluation Project

A new and unique service to the teaching field. Film Evaluations made by nation-wide Judging Committee of over 500 teachers after actual use of the films with classes.

Each Supplement consists of 50 standard-size library cards carrying detailed evaluations of 50 films, based on combined scores of 15 or more teachers on each film. Three Supplements have appeared to date. Another appears as soon as 50 more films attain their quota of 15 or more scores.

Price per Supplement—50 cards in carton, serially numbered 1 to 50, 51 to 100, 101 to 150, etc., with full explanations accompanying, 50 cents (postpaid if cash with order.)

## VISUALIZING THE CURRICULUM

By C. F. Hoban, C. F. Hoban, Jr., and S. B. Zisman.

Presents in theory and in practice the basic methodology of visual instruction in relation to classroom procedure. Provides an abundance of technical guidance in the form of illustrative drawings of photographs, reports of school journeys, suggestions for mounting materials, for making slides, film strips, etc. It incorporates up-to-date material, provides a fine balance in the treatment of various teaching aids, evaluates various types of aids, and defines the functions and values of each in the learning process. 320 pp. Cloth. Illus. Price \$2.75. (20% discount to schools)

## THE AUDIO-VISUAL HANDBOOK (4th Edition)

By Ellsworth C. Dent

Presents in convenient form, practical information for those interested in applying visual and audio-visual aids to instruction. The six chapters include discussions on “The Status of Visual Instruction,” “Types of Visual Aids and Their Use,” “Types of Audio-Visual Aids to Instruction,” “Types of Sound Aids for Schools,” “Organizing the Audio-Visual Service,” “Source List of Materials and Equipment.”

212 pp. Illus. Cloth. Price \$1.75

## AUDIO-VISUAL AIDS TO INSTRUCTION

By Harry C. McKown and Alvin B. Roberts

A practical volume which shows the teacher and administrator how to select, organize, and utilize audio-visual aids of all types, in all subjects, and at all levels, from kindergarten through the twelfth grade. Primary emphasis is on actual practice and every effort has been made to include specific information and advice which will be most helpful in the classroom. 384pp. Cloth. Illus. Price \$3.00

## PICTURE VALUES IN EDUCATION

By Joseph J. Weber, Ph. D.

Presents in unusually interesting form the results of the extended investigations on the teaching values of the lantern slide and stereograph. 156 pp. Cloth. Illus. Price \$1.00 (67c to E. S. subscribers)

## AN ALTERNATIVE FOR REVOLUTION AND WAR

By Albert E. Osborne.

A stimulating, wide-range view of the higher potentialities of visual instruction in promoting world harmony by a “more humanity-centered education.” A pertinent reply to H. G. Well’s dictum that the “future is a race between education and catastrophe.” 124 pp. Cloth. Price \$1.25.

## EVALUATION OF STILL PICTURES FOR INSTRUCTIONAL USE.

By Lelia Trolinger

A full presentation of the latest piece of research on determination of teaching values of pictures. Development of the Score Card and elaborate experiment in use of same. Full documentation, tabulation of results, and appendices. The latest, most complete and scholarly investigation of a problem in the visual teaching field that has long needed such a solution. 48 pp. Paper. Illus. Price 50c.

## PRODUCING SCHOOL MOVIES

By Eleanor Child and Hardy R. Finch

Based on first-hand experiences of the authors and those of many other teachers and movie enthusiasts. Chapters are “Organization (of a Club); Choosing the Idea; The Scenario; Buying Equipment; Using the Equipment; Filming the Picture; Advanced Techniques; Final Preparation and Showing. A welcome book to those who want movie-making explained in simple terms. 151 pp. Paper. Illus. Price \$1.50.

## SELECTED FILMS FOR AMERICAN HISTORY AND PROBLEMS.

By William H. Hartley

Part I gives directions for obtaining, evaluating and utilizing films. Part II comprises a fully annotated catalog of the most useful films for illustrating various aspects of American Civilization. Title of film, length, whether sound or silent, production date, producer, sale and rental price and grade level suitability, are given. Also synopsis of film content. Suggestions are offered concerning most effective application of the film to the teaching situation. 275 pp. Cloth. Price \$2.25.

## THE USE OF VISUAL AIDS IN TEACHING

By Ella Callista Clark, Ph. D.

Brief, clear, concise, authoritative. An attractively printed manual of procedure for all visual aids in teaching, with stimulating suggestions for the inexperienced teachers as well as for the veteran. 24 pp. Paper. Illus. Price 25c.

## HOW TO MAKE HAND-MADE LANTERN SLIDES

By G. E. Hamilton

24 pp. Paper. Price 10c.

## THE STEREOGRAPH and LANTERN SLIDE IN EDUCATION.

By G. E. Hamilton.

The most comprehensive discussion yet published.

47 pp. Paper. Price 15c.

Many other subjects of vital interest will be available soon! Send for full details TODAY—NOW!

THE FIRST of many new U. S. OFFICE OF EDUCATION training films are now ready for your use.

These new films cover occupations approved by the War Manpower Commission as those requiring FIRST attention. The subjects are so basic that they will prove valuable to practically any industry.

To increase the effectiveness of the new program, you now have available *tested* "show how" units consisting of a sound motion picture, an instructor's manual, and a silent film strip *for each subject covered*.

Partial list of films now available is shown at left. Many other subjects are now in production. They will be ready soon. To obtain full details on these—and forthcoming subjects—send the coupon below TODAY!

Put all films that you can use to work immediately!

**FIVE YEARS and \$100,000.00**  
**WERE SPENT TO GIVE YOU**  
*Filmsets* for **\$12.00 PER REEL**

Your name and address on your school stationery brings you two sample films and a Teacher's Manual that you yourself may judge the importance of FILMSETS to today's teaching of ECONOMIC (shelter-food-clothing) and PLACE GEOGRAPHY for Intermediate Elementary grades. FILMSETS are the only direct classroom teaching films available that thoroughly cover the entire course of study in one major field. There are forty-eight 200-ft. FILMSETS—22 covering shelter-food-clothing; 26 covering regional subjects—authentically—accurately—with expressive captions.

Your FILMSETS library's value and utility is increased many fold by a 112-page Teacher's Manual with 672 illustrations from the films. Each 2-page spread is a Lesson Outline—a quick, convenient, studiously prepared guide to lesson presentation and review.

### Buy One or ALL

Though they took five years to prepare—at a cost of \$100,000.00 FILMSETS gives you the teaching method of tomorrow—immediately available at prices which bring FILMSETS within the financial reach of even a one-room school. Buy one film or all! Sectional metal cabinet houses and preserves film. The time to use FILMSETS is now. The time to write for ten-day FREE TRIAL of two films and manual is today. Address FILMSETS, INC., 1956 North Seminary Avenue, Chicago (14), Illinois on your school letterhead . . . *FILMSETS, INC.* is affiliated with the DEVRYS CORPORATION.

**FREE!** Take advantage of TEN-DAY TRIAL OFFER. Films and manual may be returned.

**FREE!** Write for colorful descriptive literature that describes FILMSETS.

### Make DEVRYS Your Classroom Film Source!

NOW! NEW! You can obtain Office of War Information films through DEVRYS FILMS & LABORATORIES. Plus "DESERT VICTORY"—famed British documentary epic—in 16mm. sound-on-film. Plus a wide selection of top-flight 16mm. sound and silent CLASSROOM and Hollywood-made RECREATIONAL films. Earn attractive discounts for long-term bookings. Write for complete information—and if you haven't already done so—ask for your NEW DEVRYS FILM CATALOG. It's free. DEVRYS FILMS & LABORATORIES, 1111 Armitage Avenue, Chicago (14), Ill.

Star awarded for continued excellence in the production of motion picture sound equipment.

DEVRYS  
16mm. Sound-on-Film Projector

DEVRYS 16MM SOUND-ON-FILM PROJECTORS ARE PRECISION ELECTRONIC INSTRUMENTS

Sgt. R. H. Morris, British Army Film and Photo Unit, with 35mm. DEVRYS, with which he "shot" his way from El Alamein to Italy. Illustration rephotographed from British Illustrated Weekly.

Acclaimed by Motion Picture's top authority—National Board of Review—as the finest documentary film of 1943, "DESERT VICTORY" is now available in 16mm. sound-on-film—through DEVRYS FILMS & LABORATORIES.

A British documentary film made under fire . . . dramatically recording the British Eighth Army's smashing victory at El Alamein . . . authentically capturing the full and terrible impact of modern warfare with tanks, planes, bombs, and mines, "DESERT VICTORY" is at the same time a tribute to American motion picture equipment in that—according to the man that directed the filming—95 percent of "DESERT VICTORY" was filmed with world-famed DEVRYS Model A, 35mm. motion picture cameras.

### DEVRYS Have What It Takes!

Of the performance of DEVRYS cameras through desert sand, heat, and the impact of war, Lt.-Col. David MacDonald, Hon. A.S.C., told the late William Stull, A.S.C., then Editor of AMERICAN CINEMATOGRAPHER: "For field service our cameras had to be light and rugged. I would estimate that about 95% of 'DESERT VICTORY' was ground through DEVRYS, whose performance and ability to stand up under gruelling desert punishment constantly surprised us."

DEVRYS is naturally proud to have served those intrepid heroes who marched, bled—and sometimes died—on that relentless 1,300 mile road across the desert to Tripoli, that the deeds of their comrades and the thundering inferno in which they were performed might be preserved *alive* for all time on unchallengable film and sound track.

DEVRYS is likewise proud that its workers serve the war effort today under the coveted Army-Navy "E" flag with Star, indicating continued excellence in the production of motion picture sound equipment and secret electronic training devices for the armed forces.

### "DESERT VICTORY"

16mm. Sound. Rental price, \$2.50 per day.

Sale price, \$66.50.

# Let Us Know OUR MIGHTY ALLY SOVIET RUSSIA

For Better Understanding — For Lasting Friendship

SHOW THESE NEW, VITAL  
DOCUMENTARY FILMS

## ONE DAY IN SOVIET RUSSIA

55 Min. Special School Rental \$15.00  
Written and narrated by Quentin Reynolds. The most complete factual film report of life in the Republics of the U.S.S.R. A vast, colorful panorama of the cultures, peoples, economy, industries, geography, customs, education, and welfare programs. A definitive educational film of high interest throughout. Not a war film.

## RUSSIANS AT WAR

61 Min. Special School Rental \$15.00  
The best over-all film document of the epic drama of men, women and children who fight, work and live for Victory. Inspiring record of the Russian war effort at the fronts and behind the lines, revealing their achievement of complete unity against the foe. Meet the Russian people at war and see why Freedom's Fight can never die.

FREE: U. S. War Information Short Supplied on Same Program if Requested—No Extra Charge!

## THE SIEGE OF LENINGRAD

62 Min. Special School Rental \$15.00  
Magnificent screen drama of the 3,000,000 citizens of Russia's former capital who relentlessly resisted the attacking Nazi. The only complete film record of life within a major city throughout the period of a siege. Shows total mobilization for defense including the role of women, children, students, etc. Narrated by Edward R. Murrow.

## DAY AFTER DAY

60 Min. Special School Rental \$15.00  
The complete original film from which March of Time cut the memorable short A DAY OF RUSSIA AT WAR. Filmed by over one hundred cameramen simultaneously all along the Eastern front. Provides an unsurpassed close-up of the heroic Red Army and guerillas; real story of how the myth of "Nazi invincibility" was shattered.

## LENINGRAD MUSIC HALL

35 Min. Rental Rate \$6.00 Sale, Apply

THE WORLD FAMOUS MUSIC, DANCE, and THEATRE ARTS of the Russian People, presented in a brilliant, captivating film of great beauty. Here is a cultural treat unparalleled in the 16mm motion picture field. All of these, in ONE Memorable Film:

- |                           |                             |
|---------------------------|-----------------------------|
| Waltz of the Flowers      | Tchoikovsky                 |

# Who will design the **BEST** postwar projector?

**You will** . . . in fact, you're designing it today . . . you have been ever since you first used a motion picture projector in your classroom.

You may have wished for some convenience . . . some refinement that projectors of that day didn't have.

But your hopes became realities in succeeding Filmo models . . . famous realities like the B&H all-gear drive which *quiets* Filmos and adds smooth accuracy to their performance . . . the exclusive Magni-lite Condenser which gives so much more brilliance to the screen image . . . the unique film gate assembly and safe-lock sprockets that protect films from damage . . . these and a host of *other* practical operating improvements.

Thus *you* . . . your *needs* . . . your increasing *skill* . . . have long been vital forces in Filmo Design.

And during all these months while our entire production has been helping win the war, you haven't stopped *thinking* of conveniences you'd like in your *next* school projector. If you have some suggestions for additions or changes, let us know what they are . . . B&H research never stops in its work of *interpreting* your hopes in logical, workable, necessary improvements.

These improvements *will be* part of the **BEST** postwar projector . . . the one *you* are designing now.

It will be a Filmo Projector . . . made by Bell & Howell.

*Bell & Howell*

Make PHYSICS classes  
 More Interesting—More Effective  
 By using the  
**KEYSTONE**  
 "PHYSICS" SLIDES and REVISED MANUAL

- Four Manuals in One*
- The Fundamentals of SOUND
  - The Fundamentals of LIGHT
  - The Fundamentals of MACHINES
  - The Fundamentals of ELECTRICITY

To assist in the more effective illustration of problems and theory of Physics, KEYSTONE offers a visual presentation method employing carefully prepared slides and a completely revised and enlarged manual—really four manuals in one.

With this well-planned instruction system, student attention is focused on the material presented in the slides, thus providing a more complete, thorough understanding of the subject. Developed by war needs for faster, more effective training of students in basic Physics, this improved method will prove invaluable for better teaching in peacetime.

This improved Keystone Method of teaching Physics should be in your school—write today for complete information.

# clearer, brighter pictures with Brilliant RADIANT SCREENS

You will be astonished at how much better motion pictures, slide and strip films appear when projected on the Hy-Flect Glass Beaded surface of Radiant Screens. Details show up more sharply. Black and white projections are clearer, more contrasting. Colors stand out more vividly. Student interest and attention are definitely increased. Radiant Screens offer many other features that make for quick convenient setting up. Metal tripod models, such as Radiant Model DS here illustrated, can be instantly raised or lowered to ANY desired position without adjusting screws or plungers.

*De Luxe Portable Tripod Model D. S.*

*Radiant Screens are used by U. S. Army, U. S. Navy, U. S. Marines, U. S. Coast Guard; Our Allied Force and many thousand Government Agencies; U.S.O., Red Cross.*

## A Complete Line of Screens for Schools

The Radiant line includes all types of screens—tripod, wall, table and ceiling models—for school-room, gymnasium, projection rooms and auditorium use. Model EC, illustrated below, is a combination wall and ceiling screen which is available in sizes from 6' x 8' to 12' x 12'. Other Radiant Screens up to 20' x 20'.

## Send for New Screen Catalog

Giving full details, prices, sizes and complete specifications of the entire line of Radiant Screens. Also contains complete information on a new plan for renovating and repairing old, discolored and faded screens at small cost. Write today to: The Radiant Mfg. Corp., 1167 W. Superior St., Chicago 22, Illinois.

## Modernize Your Old Projection Screens

Replace old worn screen cloths with Radiant Hy-Flect glass-beaded surface—the fabric that made Radiant Screens so famous. There is no longer any need to show pictures on old, soiled, discolored or torn screens. Radiant replaces fabric on screens of all makes and sizes.

# RADIANT

BETTER SCREENS FOR BETTER PROJECTION.

## The Post-War Heritage

THE inevitable harvest from world-wide war is world-wide death and disaster, deep stagnation and slow recovery. Few and small are the compensations, with two exceptions—namely the forward surge of industry and invention under the mighty stimulus of wartime compulsions, and above all, in the present case, the golden possibility however faint that the united wisdom of the nations may suffice to evolve a new world permanently at peace.

In any event, one specific heritage will fall to the visual instruction field whenever this war ends. It is the vast accumulation of *personnel* and *materiel* ready to inundate the educational field when war purposes have been served—precious salvage from global catastrophe that can be turned to the immeasurable and lasting benefit of the nation, *if the transfer can be rightly handled*. In our January issue, Alvin B. Roberts gave a broad and able exposition of this situation. We want to confirm and emphasize some of his arguments, even at the risk of repetition.

### The Personnel

A veritable army of men and women will be marching back to the educational field, bringing with them new realization of the power of the picture, deeper conviction that education must enrich its traditional procedures from this day on. They have seen the screen at work on millions—soldiers, officers, civilians—artisans, shop-hands, laborers—the screen that “teaches,” for good or ill, wherever it hangs—in theatre, classroom, assembly hall, barracks, factory, even the open field.

In this returning army will be many veterans in visual teaching, their faith confirmed and knowledge widened in the use of visual aids; many veterans in verbal pedagogy, ready now to inaugurate new methods for a new day; many youngsters with teaching ambitions, called away from their studies by the war, now aglow with new ideas for higher achievement in the classroom. And far more thousands of this homecoming army are not teachers, never were nor ever will be, but they have seen the compelling evidence, the pedagogic “miracle.” All are citizens of some community, and will insist that peacetime teaching in their community measure up to wartime accomplishments. Many are parents, and they will demand that the schools give their children richer learning and better training than before. There is scarcely a community in the country but will feel the impact of these returnees. For many a School Board the lotus-eating days are over. A new jolt is on its way to them. They will be freely furnished with a strong incentive to take action or take leave. And how some School Boards need that jolt!

The transfer of this *personnel*, done on its own initiative and under its own power, will be relatively simple and automatic. Furthermore, it will be going back

better than when it went away! How gravely different is the problem of the *materiel*! It will come back worsened, often worthless. The transfer must not be “simple” or “automatic,” or it will be disastrous.

### The Materiel

An enormous mass of visual equipment and material will become obsolete for its present use on Surrender Day, and invaluable to the educational field on the day after. Tens of thousands of motion-picture and still projectors, of films and slides and filmstrips, of screens and shades and seats, will be awaiting the new dispensation. Much will be worn or damaged beyond worthwhile repair—much will be brand new and unused, for doubtless, according to the fantastic “economics” of wartime, huge deliveries will be continuing up to Armistice Eve, and even beyond—and the rest of the gigantic stock will be salvageable.

The simple way, of course, is to junk it all! This plan has been seriously advocated, and from surprisingly high quarters. “In these days of FeDeRal flinging of billions,” typewrites one ardent advocate, “why haggle over a matter of mere millions?” But we doubt the necessity of resorting to any such weird economics. The plausible argument for junking, namely, that worn and worn-out equipment will do more harm than good to the visual education cause, is not only plausible but valid. Defective material must never be allowed to reach the schools. Most schools innocently accepting such equipment will be beginners in visual instruction. An imperfect projector, placed in a school hopefully embarking on its visual teaching career, could kill the newborn ambition at the start. It could also seriously taint the maker’s reputation in that school or school system. Lurking behind this valid “good of the schools” argument there may also be another consideration, spoken or unspoken, commonly known as “good business.” We refer to the very obvious idea that junking of the old means more selling of the new. Oddly enough this obvious idea, we hope to show, is not valid.

When moving-day comes for this heterogeneous mass of material, we believe that three possible procedures should be definitely barred:

- (1) The materiel *should not* be stacked up in “Army Stores”—of blessed (?) memory—for indiscriminate sale, as is, at ten cents on the dollar.
- (2) The materiel *should not be* sold off in carload lots at scrap prices, to dealers willing to sell, as is, to unsuspecting schools at 1000% profit.
- (3) The materiel *should not be* consigned en masse, as is—the good and the bad, the used and the unused—to the ever-convenient junk heap.

These “*should-nots*” must be balanced by a “*should*”. We have some suggestions to offer—in the next issue.

# Announcing...

## THREE FAMOUS PICTURES

Produced by

**DAVID O. SELZNICK**

Now available for the First Time in 16 MM

### THE ADVENTURES OF "TOM SAWYER"

Rental \$15.00 per day

Tom Sawyer is the immortal American boy, beloved by all who have thrilled to his fabulous adventures in the pages of Mark Twain's memorable classic. In this sensitive production each of the lovable characters—Tom, Huck Finn, Injun Joe, Becky Thatcher and Aunt Polly—is vividly brought to life. It is America's best loved story . . . America's warmest tradition.

Cast: Tom Kelly, May Robson, Walter Brennan.

### "THE PRISONER OF ZENDA"

Rental \$15.00 per day

Three great stars—Ronald Colman, Madeleine Carroll and Douglas Fairbanks, Jr.—unforgettably portray leading roles in the film dramatization of this legendary story by Anthony Hope. It's a tale of daring adventure . . . of regal romance and flashing swords and life-and-death intrigues. Each generation has thrilled anew to this romantic adventure, but never has there been a more stirring presentation than in this production. It will inflame the hearts of all who see it.

### "THE GARDEN OF ALLAH"

Rental \$15.00 per day

Mid the strange mysteries and fascination of the Algerian Desert transpires a story as enchanting as its wondrous background. From two strange corners of the world come a man and a woman, conquered by a love that overpowers them . . . a love that for him is forbidden . . . for he is an escaped monk from a Trappist Monastery, and bound to God by eternal vows of chastity, poverty and silence. Charles Boyer and Marlene Dietrich are magnificent in this beautiful production.

# Photography in the High School

An able exposition of the reasons why photography deserves a place in the educational curriculum.

**ROBERT W. WAGNER**  
Bureau of Educational Research  
Ohio State University, Columbus, Ohio

(Courtesy Brooklyn Children's Museum (Photo by Mrs. Ray Garner)  
Fixed focus enlarger for enlarging miniature pictures to album size.

**I**N 1814 a French chemist by the name of J. Nicéphore Niepce, was experimenting with mechanical apparatus and certain chemicals in an effort to capture and "hold in permanency" images of faces and landscapes. His colleague, Louis Jacques Mandé Daguerre, a painter by profession, was interested in the work of Niepce chiefly because he believed that through chemistry he might learn a way to reduce the cost of painting portraits. Instead of developing a process which would prove a boon to the artist, Daguerre eventually perfected a technique which actually threatened to put the portrait painter out of business. The process was Photography. The year was 1839.

Since that time, the photographic process has played a major role in the development of our modern civilization. Not only has photography had its effects upon many fields of man's present activity, but also much of what future generations will know of our society will be derived from photographic records. Indeed, it may be that the history of our times is being written in an altogether new way—written with the lens and the sensitive film—written everyday in the photo-albums of the world by thousands of camera enthusiasts who may be listed among the most objective recorders of the American scene.

For the educator it is significant that most of those in the foremost ranks of camera-users are young people. There are two chief reasons why youth has taken so avidly to the field of photography. First, the production of inexpensive equipment has made it possible for almost anyone to own a camera. Second, young people have found in photography a satisfying field of creative endeavor. It is the modern art of a modern age.

As photography continues to improve its position among the arts and sciences, and as an increasing

number of school-age youth become interested in photography, instruction in this field will expand.

Several universities have offered photography courses for many years, but the type of training provided is generally of a technical nature, designed to meet the needs of the specialist. In recent years, however, the growing army of amateur photographers has demanded training of a less technical and more practical type, bringing to the attention of many public high school administrators the possibility of providing systematic instruction in the photographic skills in the high school.

In the curriculum of the average secondary school, however, there is no place for an additional subject which comes without the best of recommendations and without the promise of being a fruitful educational experience for all who engage in it. The crowded condition of most school curricula and the narrowness of many school budgets cannot ordinarily be easily adjusted to include a new division of training. If photography is to be taught in the high school, there must be, therefore, ample justification for its inclusion in the school program.

For those who are considering the inclusion of such a course in the curriculum, the following objectives might be considered.

## **Objective 1. To Improve the Ability of the Amateur Photographer**

Those who consider setting up a high school program in photography should constantly keep in mind the fact that most of those who enroll in the course want a practical, understandable, working knowledge of how to make better pictures with the more simple types of cameras and equipment. Exploring the possibilities of photography as a vocation should be secondary to the purpose of improving the ability of the amateur photographer.

Since technical difficulties in picture-making have been reduced to a minimum, photography has become for many persons, a simple matter of following the manufacturer's motto, "You snap the shutter, we do the rest." The disadvantage of this kind of photography is that much of the real thrill and pleasure is lost if the amateur confines his activities to the making of miscellaneous snapshots which are then delivered to the none-too tender mercies of the drug-store photo finisher.

Many amateurs hesitate to do their own processing because they lack knowledge of a few elementary principles and techniques. By acquainting the individual with the basic photographic skills, the satisfaction of doing a complete job, from start to finished product, may be enjoyed. Beyond the simple job of developing and printing, the pleasure in photography and the efficiency of the amateur may be greatly increased by the knowledge of enlarging, toning, silver-printing, retouching, and other special processes.

### Objective 2. To Exploit the Possibilities of Photography as a Group Activity

That photography is becoming more and more a group activity is shown by the large number of clubs and photographic societies which have been organized during recent years.

Where people work with the same materials—light, lenses, and sensitized films and paper—a gregariousness is developed in the group resulting in a pooling of common problems and common interests. Such cooperative activity is in complete accord with the democratic principle of the sharing of experience—a sharing which can come only as people see things eye-to-eye and develop a center of interest.

Photography clubs frequently engage in excursions to nearby parks, industrial centers, commercial marts, or civic centers, where pictorial possibilities are rich and varied. On such excursions, the beauty of a landscape, a row of factory chimney pipes

silhouetted on a background of smoke, the skyline of the business district, and the symmetrical pattern of an arched bridge, become common denominators for all whose eye is on the lookout for subjects to be recorded on celluloid.

Again, if conducted as a group activity, the pleasure of looking at the finished picture can be enhanced. Everyone likes to look at the other fellow's snapshots and have his own work enjoyed by his friends. Understandings can be built up, appreciations developed, and suggestions made for the production of better photographs.

### Objective 3. To Develop Photography as a Worthwhile Leisure Time Activity

The increasing amount of unoccupied time that many youth now have is a growing problem for the educator. A recent recommendation of the N.E.A. stated the great need for school training in purposeful leisure time activities which can be carried over into adult life.

Highly technical and mechanized as our civilization is, many people find release and recreation in simple divergences such as stamp collecting, coin collecting, reading, or home carpentry. The number and variety of hobbies that people engage in has increased tremendously during the past ten years. However, many people still occupy their leisure time by "buying" their entertainment simply because they have no other satisfying or profitable leisure time activity.

Photography has become a hobby enjoyed by people the world over. It has justified itself in terms of the satisfaction it brings to those, who, due to the nature of their vocation, do not have a chance to do any real creative, much less artistic work. The factory worker, for example, or the person who works on an assembly line, finds in photography a hobby where he can see the whole product of his labor, start to finish—not just a fraction of the whole. His aesthetic sense is given a chance to develop, and he becomes more alert to the possibility that there might be real beauty even in the factory where he works. He might see the symmetry in the cogs of the machinery, and

Making a library film at Rufus King High School, Milwaukee.

become aware of the line, tone, color, and texture of the wood, stone, and steel that is part of his environment.

In this sense, photography can become not only an activity to be engaged in during off-hours, but a mind set which carries over into working hours, as the amateur photographer becomes increasingly sensitive to the beauty of commonplace things.

#### Objective 4. To Teach Students How to Look at Pictures

We live in a pictorial age. The magazines, *Look*, *Life*, *Click*, and others of the same type use more space for pictures than they do for printed material. Tabloid newspapers have long made extensive use of photographs, and the editorial staff of the average daily newspaper recognizes the essential truth of the old bromide, "one picture is worth a thousand words."

Allied with the still picture, in that it is a series of still photographs, the motion picture has been recognized as a powerful medium for changing attitudes and conveying information. Peter Odegard, well known political scientist, writes: ". . . the movies bid fair to exert a more profound influence on human behavior than the printing press."<sup>(1)</sup> This may or may not be an overstatement, but it is certainly true, as George Bernard Shaw once said, that "the number of people who can read is small, the number of those who can read to any purpose much smaller, and the number of those who are too tired after a hard day's work to read . . . enormous. But all except the blind and deaf can see and hear."

Advertisers make extensive use of the photograph to boost their products; and advertising photographs, like war propaganda pictures, may often be falsified. There is a distinct need for some type of training which will aid the consumer to evaluate magazine, newspaper, and advertising photographs, not only as regards their technical quality, but also as regards their truthfulness. Some basis for understanding and evaluating the motion picture also seems very necessary. One can see rather clearly

the role of the cinema in forming ready-made conceptions of the world in its stereotyped treatment of different peoples, different occupations, and different forms of life. Training in photography could easily be expanded to include picture appreciation and evaluation.

#### Objective 5. To Integrate Information Drawn from Related Fields

It is significant that the pioneers of photography came from several different professional fields. Niepce was a chemist, Daguerre an artist, and Fox Talbot a politician turned scientist.

Photography is at once an art and a science, requiring that the worker in this field have the ability to make the quantitative analyses of the chemist and the physicist, as well as the ability to determine the quality of the subject and the worth of the final product in terms of aesthetic principles.

A photography course can be of infinite value in bringing together in a working relationship, the basic principles of several areas of instruction. Even if no separate course were set up, instructors of chemistry, physics, fine arts, and industrial arts could doubtless do much to vitalize and functionalize their courses by demonstrating the relationship of photography to their respective fields.

For example, the student of physics could learn the principles of lenses in no more concrete and practical way than by finding out how the camera works. The chemistry instructor can easily demonstrate the effect of light on silver salts by using photographic paper or film, and could extend the principle of light action into a practical application by allowing the students to sensitize a piece of material and make a picture with it in a "pin-hole camera" of their own construction. In the art class, principles of composition can be taught by making photographs or photograms, and in the industrial arts laboratory, a darkroom could be constructed. Such a procedure would mean not only an integration of knowledge, but it would mean that the student would "learn by doing."

#### Objective 6. To Learn Photography as a Useful Tool

Recent developments in the methods of taking and processing photographs indicate that the possibilities for future development are as yet without limit. By the use of stroboscopic light, photographs have been taken at the almost unbelievable rate of 100,000 per second! Such pictures are used to study machinery in motion and to note where avoidable friction may be cutting down the efficiency of the machinery. Stop-motion photographs have great value in the photographing of human and animal subjects, and current advertising often makes use of high speed photography to secure life-like, unposed, but effective illustrations.

Other specialized uses of photographic processes are the X-ray, the photomicrograph, aerial photography, infra-red photography, and color photography. Engineers, criminal investigators, physi-

## This Is Your World

Fine emphasis upon the cultural values  
of motion pictures in public education

**E. M. BENSON**

Chief, Division of Education  
Museum of Art, Philadelphia, Pa.

IT IS obvious to everyone, even to the most doctrinaire textbook-minded teacher, that the non-theatrical film industry is going places. Exactly what this objective is, is not always clear. Those of us who regard the film as an art, when it is an art, and who have high hopes for its steadily expanding use in every sphere of public education, often wonder whether it is being misused; we often have reason to suspect that, in the hands of men of small vision, it may become just another gadget: a new tool to do an old job.

All great inventions of the human mind—and certainly the film is one of the greatest—are a challenge; they are a challenge to our selfless sense of humanity and of beauty which is in a constant state of struggle with our self-interest. All of us have a stake in the way this struggle will be resolved within the 16mm film industry. Either it can go the way of Hollywood and create a confused pattern of opportunism, sometimes beneficent, but most often innocuous when not actually malevolent. (What happens in and to a film is never an accident.) Or it can take the rough road of democracy and make use of the film to share the world's knowledge and culture; to share it in such a way that the love of the good things of life will become the possession of all of us. Never before has democracy had a better opportunity to demonstrate that it means business.

Those of us who have undertaken the task of planning 16mm film programs for large lay audiences on broad topics of vital public interest, and who, in the process, have screened hundreds of films, conferred with many of the producers, distributors, and film authorities, and have had occasion to refer to and study

the literature on the subject—are convinced that despite the abysmal ignorance of most commercial distributors concerning the merit of their own merchandise and the educational use to which it can be put—the non-theatrical film groups throughout America can serve as a bulwark of practical idealism against the engulfing tide of Hollywood virtuosity.

As a matter of fact this is actually what is taking place today. I dare say that non-theatrical films have made a more substantial and more consistent contribution to the war effort than has Hollywood, not solely in terms of numbers reached, but in the effective sincerity of the message conveyed. And this is because individual film-makers and producers with talent and initiative and devotion to a progressive point of view, still have a fighting chance to succeed on their merit in the 16mm field. As yet 16mm film production is not so heavily capitalized, nor are the avenues of distribution so rigidly controlled, that powerful monopolies can drive a wedge between unstandardized film genius and standardized film production. The road to progress is still wide open, and it is wholesome and desirable that it remain open if the film as an art, and as a democratic medium of public education is to survive.

These are the conclusions I have reached over a period of about five years in the process of bringing together, within purposefully organized film programs prepared for the Philadelphia Museum of Art, the very best 16mm pictures available. I am persuaded that the

film, carefully chosen for its quality and content, can be invaluable in preparing people to appreciate art; not art in the narrow scholastic sense, as signifying the work of an old master, but the art of civilized living. In other words, any form of creative order whether it is design in nature, city planning, the art of designing a shop window, a printed page or a painting by Picasso. The reason for this is that the visual, psychological and cultural patterns of the world we live in can be illustrated more forcefully and more memorably in such films as *Death Day* by Eisenstein, *The River* by Pare Lorentz, *China's 400 Million* and *Borinago* by Joris Ivens, *Art and Life in Belgium* by Charles Dekeukeliere and *The Mystic Lamb* by André Cauvin than by any other means.

It was logical, therefore, that our first thirty week film program should describe *The Development of the Documentary Film*, as it relates to industry, consumer education, housing, journalism, social welfare, health, politics, education, the arts. These fact films succeeded, we believe, in persuading a good number of the fifty thousand Philadelphians who saw them that the basic issues of human living were not being faced frankly and courageously by Hollywood. The British fact films were by far the best in that they combined sincerity of purpose with an unusually high degree of film quality. Although occasionally ineffectual for American audiences and although sometimes monotonously stereotyped in filmic concept, they were, nevertheless, a source of instructive satisfaction to most audiences and a rich source of stimulation to young American filmmakers who were beginning to strike out for themselves.

The few good 16mm films about art which we came across led us to explore the problem further, because we were now thoroughly convinced that the visual language of the film is ideally suited to the interpretation of the visual arts of painting, sculpture, architecture. We were fully aware also of the discouraging fact that most so-called art films were dull-as-dusters of no distinctive quality. But the need for bringing all of the best art films together for the first time to promote the wider

use of such films and to encourage the production of still finer films, seemed far more important than the unpleasant fact that most of the existing films were far from masterpieces.

This thirty week art appreciation film series was sequenced, as to film topics, in such a way that the films' limitations were far less obvious than their message. Beginning with *Design in Nature* the arts were covered in approximately the order in which they evolved historically—namely shelter, weaving, pottery, sculpture, painting, the graphic arts, etc. concluding with the abstract films of Man Ray, Fernand Leger and Oscar Fischinger.

We were prepared for a smaller audience because, certainly, these films about the arts were not particularly entertaining. To our amazement the program met with an unusual amount of intelligent enthusiasm and an attendance somewhat larger than the preceding year. This bolstered our belief in the public's insatiable hunger for facts of all kinds if the films used to explain these facts are clearly and purposefully related to a theme. Not just any theme, but one that embraces a large area of fresh relationships. People seem to prefer programs that give them a broad encompassing grasp of a large area of human activity, no matter how remote from their own lives this activity may be.

Events both national and global suggested the three film programs which followed in sequence during the next three years: *Rediscovering America*, *Our Fight For Freedom* and, our current film program, *This Is Your World*. Just how far we have progressed during the last three years in our understanding of ourselves and of our neighbors the world over—as well as in our awareness of the value of films to bring essential information to everyone so that we are better able to share

A shot from "China's Four Hundred Million".

the same democratic convictions and work toward the same objectives—is brought home to us in the type, quality and quantity of 16mm films now available which were nowhere to be found only three years ago.

Whatever confusion exists within the 16mm film industry, concerning the kind and quality of films needed today, is not so much the fault of the industry itself, but partly reflects the contradictory voice of the American people as expressed through their congressmen—the people's representatives who, out of political spleen, completely effaced one of the few film producing units and coordinating film agencies in this country, namely the OWI, which had a policy and a program worthy of the American spirit. This was a great American tragedy, with political opportunism victorious over an enlightened film program of public education.

Thanks to the OWI and other government film agencies—the Coordinator's Office of Inter-American Affairs, the Department of Agriculture, the Signal Corps, and similar film units of the British and Canadian governments—a substantial number of fine 16mm films now exist which can be used and are being used to very good purpose by millions of people throughout the world.

But fact films, even the best of them, can reach a saturation point, and we were beginning to suspect that that point had been reached with our audience. Having made use of the fact film to explore ourselves as a people and as a nation, (e.g. *Rediscovering America*) and then as a united community of nations determined to defeat our enemies, (e.g. *Our Fight For Freedom*) no moment seemed more timely than the present to plan for peace—a permanent peace securely built on a bedrock of human understanding (e.g. *This Is Your World*). This could now be best accomplished, we thought, by turning from the fifty minute program of fact films to feature-length masterpieces of the film, great classics of the screen of unquestioned quality like *Wedding of Palo*, *Carnival In Flanders*, *A Nous La Liberté*, *The Private Life of Henry VIII*, *Elephant Boy*, *Time In The Sun*, *Rembrandt*, *Alexander Nevsky* and *Ruggles of Red Gap* which inspiringly and faith-

fully reveal the culture and character of the country and the people they represent. Such a program, would, we felt, serve a double purpose: to help prepare our hearts and minds for the great decisions we must make after this war is won; and, incidentally, to enjoy and appreciate many of the finest films of our time.

A practical application of this film series is the formation of a *Film Critics Club For Young People* to explore the use of the film for the purpose of creating a better understanding among the peoples of the world, and to serve also as a forum for the discussion of topics relating to the film. This was organized jointly by the Division of Education of the Philadelphia Museum of Art and the Division of Visual Education of the Philadelphia Board of Public Education.

Comprising more than one hundred youngsters drawn from every senior high school in Philadelphia, the Film Critics Club will meet at the Art Museum on alternate Saturdays beginning February twenty-sixth through June third. Assisting in various capacities as leaders, co-leaders and advisers for the group meetings are the movie critics of Philadelphia's three leading dailies, leaders in many related fields, and representatives from several film producing companies including Brandon Films, through whose cooperation most of the films were secured, British Information Services, National Film Board of Canada, Harmon Foundation, CIAA and the OWI.

Every possible facility—the advice and encouragement of the most distinguished authorities in the field, conference quarters, projection facilities, a lending library of books on the film—will be placed at the disposal of the Film Critics Club in order to make it an adventure in the newest and most popular art of our time.

From "Alexander Nevsky," Russian film chronicle.

As we have seen, films are not just items of instruction or entertainment but food to feed our spirits, basically essential to our well-being. If we grow strong as a people and as a nation it is because the American educator has fulfilled his role of leadership in the spiritual destiny of his country.

Dr. John T. Garman, Director of the Division of Visual Education, School District of Philadelphia, examines the instantaneous recording equipment used by the division. The two turntables allow for the duplication of recordings circulated among the schools.

## Audio-Visual Aids -- A Survey

(Concluded from January issue)

MARY LOUISE MOLYNEAUX

Supervisor of Elementary Education  
Public Schools, Pittsburgh, Pa.

THE first installment of this survey attempted to give a picture of the organization and administration of audio-visual aid departments in twelve school systems, and to indicate how materials and equipment are utilized in the classroom. Practices characteristic of particular systems were cited. This concluding installment presents a summary of the facts as a basis for the implications that follow. No survey has value unless out of it come suggestions for improvement, or additional problems for further study.

The future of visual materials as an aid to learning lies in our ability to facilitate their availability to schools, to evaluate constantly their value in relation to the changing curriculum, and in the ability of the teacher to use them effectively in the classroom.

### Summary

In the twelve school systems visited the distribution of visual aids is well organized. Eleven systems have visual aid departments headed by a director who is responsible for the entire program. The other system because of its relatively small size has a committee of teachers responsible for the selection and use of materials. Without exception these school systems have made an effort to retain sufficient personnel and facilities during war time to operate without seriously curtailing service. In at least one third of the schools women and high school boys and girls now are filling positions as film inspectors, bookers, truck drivers, or assistant shippers.

The visual equipment used in the schools in most

systems has been purchased by the department, but in two cities a small number of motion picture projectors have been provided by the individual school or contributed by a community organization. The most widely used type of equipment is the  $3\frac{1}{4}$ " x 4" slide machine and the 16mm. silent projector. The use of the 16mm. sound projector was on the rapid increase until the war emergency stopped expansion temporarily.

All systems are encouraging teachers to learn to operate equipment, but principals, and itinerant and student projectionists are used when teachers cannot operate machines or do not wish to be responsible for running them. This is particularly true in the operation of sound equipment. The classroom is conceded to be the ideal setting for showing visual teaching materials, but the large number of inadequately equipped classrooms too often necessitates using the auditorium or a projection room for the showing of films, especially sound films.

Eight cities prefer to purchase all their visual aids with the exception of some long term lease material which is not available for purchase. Three of the smaller systems because of their size secure most or all of their films on a rental or loan basis. One large city rents most of its film material on the grounds that this prevents obsolescence and depreciation, and makes the newest always available.

As may be expected  $3\frac{1}{4}$ " x 4" slides and 16mm. silent films are the most numerous aids. With the increase in the number of sound machines and the availability of good instructional sound material the purchase of sound films is increasing rapidly. In-

terest is developing in the 2" x 2" slide and filmstrip and at present they are used to some extent in about two-thirds of the school systems visited.

Two-thirds of the school systems distribute natural history and social studies exhibits. In one city such exhibits are distributed by the public museum entirely independent of the school visual department. One system in particular is making a special effort to distribute good maps and charts. Two systems circulate science experiment cases.

Directors are encouraging the use of visual material for instructional purposes, but they feel that too many teachers are not using it effectively as a classroom aid to teaching. This is probably more the fault of the administrator than the teacher as there is little evidence of other than an incidental attempt at in-service training in the effective use of these materials. There is a noticeable effort, however, on the part of all visual directors and department heads to select cooperatively the materials that will fit the curriculum, but much remains to be done.

The public museums have an important place in visualizing the curriculum. Exhibits prepared for the schools are authentic and well made. Class visits to the museum seem most successful when they are for a specific purpose rather than a general visit. Present transportation difficulties have greatly restricted group visits, but the museums are meeting this emergency by taking exhibits to the schools, or by having frequent lessons at the museum with schools within walking distance.

The use of auditory aids in the classroom has expanded the visual department into an audio-visual department. About one half of the systems visited circulate musical and speech recordings purchased or made by the school. When equipment again becomes available after the war, directors feel that recordings will be more widely used.

Three cities have developed school radio programs on a large scale. Programs are prepared and presented by directors, staff, students, and occasionally laymen. One city has its own radio station which broadcasts throughout the school day. The other two have access to the local stations four or five times weekly. The principle upon which these programs are presented is that broadcasts by school people are prepared in the subject area desired, are written especially to fit the local school situation, are a good public relations feature, and may act as an in-service training device for teachers.

There was a consciousness in all other systems of the network educational radio programs, but their classroom use is left to the discretion of the teacher. Radios are not provided by the departments. One city broadcasts a series of public relations programs prepared by the various department heads and selected teachers.

The keen interest in audio-visual aids evidenced by these school systems, and the earnestness with which they evaluate their programs is stimulating. If their efforts are indicative of the efforts of other school systems, there is a bright future for audio-visual aids as effective learning aids.

## Implications

As war time restrictions upon equipment limit the expansion of visual departments for the duration, this is an excellent time to make an evaluation of the department and its services. The data from such a study will provide the basis upon which to build a long term program. This evaluation and planning should cover three areas: the department organization, equipment and material, and their effective use in the classroom.

**Department Organization**—Department organization should be evaluated in terms of the most effective service to the school. Filing, booking, maintenance, delivery, and other duties of the personnel are satisfactory only so far as they facilitate the availability of the material to the classroom. In relation to the size of the systems visited the personnel varies from relatively large to a relatively small number. A study of this problem may reveal the optimum number of personnel for efficient service.

**Utilization of Equipment**—The classroom is the ideal place for using instructional visual materials. School systems should plan to provide dark shades and electrical outlets in enough classrooms so that teachers will not have to move classes for film showings. This is time consuming, puts the film on the basis of a special event, sometimes puts another teacher out of her classroom, and limits the flexibility with which the film may be used. A permanent classroom screen is more desirable than a portable one as it eliminates the necessity of setting up the temporary screen, is usually larger, and is high enough for all to see well.

The sound machine is creating a very definite problem in the effective use of film material. Because of its size and cost it is usually housed in the auditorium and operated by the principal or one teacher. This immediately limits its operation too often to the entertainment type program with a large audience in attendance. At the present time most of the best classroom instructional films being produced are sound films, but when they are used in a recreational set-up, they lose their teaching value. They should be used as classroom aids. This involves the training of more teachers to use the equipment, and the problem of transporting it about the building, but it must be done eventually for the equipment and material are too costly for the present use made of them.

One solution to the problem of transportation is the use of a projection room. This, however, does not change the fact that more teachers must learn to operate the sound machine with ease and confidence. The projection room has not been used sufficiently to fully evaluate its usefulness, but it may be the answer to the problem of sound film projection and should be further experimented with.

It is desirable to use competent student projectionists in the high school if they work under careful supervision. This, however, is not practical in the elementary school.

#### ***Integration Of Materials Into The Curriculum—***

Much remains to be done in giving the teacher aid in selecting materials. It is the first step in bringing about the improvement of their use in the classroom. No teacher can select the most suitable material from a general catalogue because titles and descriptions are often misleading. Therefore, it is desirable to allocate certain films to the best place in the curriculum, and to look for new materials in those areas that are neglected. If a film is restricted to a particular area, it will be more readily available to the teacher when needed. This should be a cooperative program between the visual and other departments, and the visual department should take the lead.

The visual aid catalogue should then be made up in terms of film title, description, and specific recommendations. In addition, each department may prepare its own catalogue in terms of only those materials that best suit that particular area. This will call for a careful evaluation of materials by directors other than the visual director, and make possible guidance in use of those materials in greater or more specific detail. A loose leaf catalogue will aid the teacher in inserting supplements in the proper order.

If certain films are allocated to the most suitable place in the curriculum, it will be a definite guide to the director in knowing the number of prints of each film to purchase or reorder.

There is need for more material to illustrate local history, industry, geography, and geology. This is difficult to purchase commercially. Therefore, each school system should build up such a library. For example, the public museum can prepare dioramas illustrating episodes in historical development, and specimen cases of resources and manufactured products. The school photographer or trained

teacher can make slides or motion pictures of a civic and geographic nature. If a teacher is used, he should be on only a part time teaching basis.

In selecting visual materials for the curriculum the aid that best conveys the idea should be recommended. There is a tendency to stress the purchasable type materials to the exclusion of those available without purchase, and the motion picture to the exclusion of still projection. If motion is desired, the film is the most effective when the real thing cannot be observed. If close observation of details is desired, then slides are excellent if a specimen or model is not available. Magazines and newspapers have excellent maps, charts, and pictures. Boys and girls can bring in many materials if they are stimulated to do so. Although such aids are not distributed by the visual department, they should be suggested to the teacher along with other materials.

A system that maintains a large purchase library should consider carefully the amount of money spent for film rentals. If films have been purchased to suit the existing curriculum, then the only areas where rentals should be needed are those of a temporary nature.

#### ***In-Service Training In The Use of Materials—***

The in-service training for the efficient use of materials is the weakest phase of the visual program. Administrators are not sufficiently aware that many teachers because of a lack of training are misusing these aids. There is little evidence of careful planning to show teachers how to make visual materials a functional part of a lesson. Many need help in selecting the best type of aid for the desired purpose. Some are not aware of the differences between instructional and entertainment films. Others are not conscious of a good physical

setup for the learning situation they wish to create.

The great amount of money involved in providing materials and equipment cannot be justified until some long term plan of teacher education is put into operation. It may be built around the following:

1. workshop meetings where common problems are discussed and worked out. They may be for teachers of a particular grade or subject throughout the city, in contiguous schools, or within a school. They may be both voluntary and required.
2. demonstration lessons illustrating uses of specific materials, or techniques for using materials under specific circumstances or with types of groups.
3. specially prepared teacher's guides suited to the use of selected films in certain curricula to be circulated with the film.
4. a competent teacher on call to work in the classroom with the teacher to assist her in fitting materials to her specific problems and helping her to overcome her particular difficulties.
5. group showings of newly acquired materials to teachers concerned indicating and discussing their classroom uses.
6. designated schools in different sections of the city to be used as centers for working out problems common to that section and as visiting centers for teachers who wish help.
7. director-principal-teacher conferences to survey the possibilities within a school to plan a program of improvement.
8. a series of discussion lessons on motion picture appreciation for the purpose of having a few interested teachers experiment with it.

**The School and the Public Museum**—Every effort should be made to strengthen the bond between the school and the public museum. Planning a museum program that integrates or supplements the school curriculum is highly desirable. The museum teacher in cooperation with the director of the school departments concerned should prepare a suggested list of lessons to be offered to the visiting classes during the current year. This narrows the range of selection to areas in which the museum has worthwhile material, and at the same time gives the teacher an opportunity to select that subject in which her class is most interested.

Schools should be given the privilege of choosing the time they wish to make their visit. Authorities are agreed that children get more from the trip if they come for a specific purpose. Therefore if a class is working on a unit that lends itself well to the museum offerings, it should apply for an appointment at that time rather than being required to visit during a unit of work to which the museum cannot contribute. Another advantage to allowing the school to choose its own time is that it will not conflict with other school activities. To illustrate, children get little from a visit if it is the day before a school play or the day after a track meet.

The persons who work with the children at the museum should be skilled teachers, or those having a teacher's viewpoint and a knowledge of the classroom and the child. A knowledge of the subject field is essential, but to know children is equally important.

Materials prepared for school use should cover as wide a range of school subjects as possible. For example, there are as many possibilities for interesting exhibits in the field of social studies as in natural history. Children should be allowed to handle certain types of material for they learn through touch as well as sight.

As a wartime measure, having the museum teacher go to the school is desirable though obviously it is more satisfactory for the children to go to the museum. An experiment with a few classes within walking distance, who come quite often, should reveal interesting results to both school and museum workers.

**Auditory Aids To Learning**—Schools cannot ignore the possibilities in the use of auditory aids: the recording and the radio.

Some departments circulate recordings for music appreciation in the same manner as visual aids are distributed. Visual departments not making use of this aid should confer with the heads of their music departments concerning its advisability. A survey of the schools would probably show that some now have satisfactory equipment. The cost of records, packing cases, and breakage is comparatively low.

School made recordings have many possibilities. Records made of worthwhile radio speeches or programs may be circulated through the regular channels. Recordings may be made of school activities to be broadcast or presented for public relations purposes. Musical or dramatic programs or speeches in the preparation stages may be recorded and played back to the participants for self-criticism and improvement.

A school system should consider carefully the expansion of its radio activities. As a beginning it is more advisable to survey the present use of network broadcasts in the schools, attempt by workshop meetings or demonstration lessons to train teachers to use radio more effectively, and to consider some type of appreciation lessons to guide children in the home use of radio. A further survey to discover certain areas in which teachers feel broadcasts would be helpful may be followed by a series of programs in those areas broadcast at the time and in the place of the regular public relations program. It is agreed by those who use radio extensively that broadcasts to the schools are followed carefully by the public and are received with great enthusiasm. An evaluation of such activities will determine to what extent the school system may wish to expand its radio programs.

War time developments bring the possibilities of television closer to a practical reality. School people should be thinking in terms of its usefulness to the schools.

# MOTION PICTURES— NOT FOR THEATRES

By ARTHUR EDWIN KROWS

AMBITION alone had not been responsible for the great changes in the Carpenter-Goldman business. In 1926 had come the concluding phase of Wallace Kincaid's Pictorial Clubs, where both Carpenter and Goldman had belonged to the board of directors. Urban had a casual interest in the Clubs, with a few of his pictures on their releasing schedules. The outlet for his famous library had had a much graver turn, though, in the coming of sound pictures and the collapse of Vitagraph which the Warners had purchased early in 1925, because in the later years the Vitagraph exchanges had distributed most of the Urban subjects. Urban seems to have become first interested in the Spirograph about 1916, largely because it afforded a way of utilizing the very short scenes of early picture-making, so plentiful in early numbers of his collection, as well as for those brief items produced for his newsreels. The idea of presenting motion picture photographs spirally on a disk seems to have occurred to many experimenters; but apparently its rights were held most clearly by Alexander Victor, who had used the principle in his first Animatograph in 1909. But Victor, in his characteristic dislike of monopolistic control of patents, had readily consented to Urban's project. In return, the Urban Spirographs were manufactured at Victor's plant in Davenport, Iowa. The completed machine was first demonstrated about 1923.

Urban believed that there was also place for the Spirograph in the undeveloped field of home movies, and Joe Coffman felt the same way about that. While Coffman was in the mood he told me one day that, as the time of the small non-theatrical producer was definitely over (now that Big Business was appropriating his work), it was vital to all of us to turn to new fields such as that of home movies. The Carpenter-Goldman opportunity to enter there with the Spirograph had come when a high-pressure sales organization, to which Urban had entrusted the exploitation of the Spirograph and also of a folding bed of his invention, was called for a district attorney's investigation, and the existing stock of machinery and pictures was left for acquisition by anyone having sufficient vision to see the possibilities. Money was scarcely necessary, as the materials could be had on consignment. Coffman believed that the Spirograph was admirable for schools, too, and privately envisioned a phonograph attachment which would make its projection a talking picture. He might even have proved his point, but apparently his horoscope had specified other directions for his energy.

George Lane, who bought Arthur Carpenter's interest in January, 1927, was a gentleman of that *Joshua Whitcomb* type, with kindly face and white hair, which we like to think of as "real American." He struck me, when I first met him, as being decidedly out of place in this dizzy profession of ours, but he actually had a better right to be there than most others who expected to profit from non-theatrical investments. Several years later I came to know him fairly well, and then he told me some of the circumstances of his coming in.

He had been trained as a mechanical engineer. He had prospered, and with a brother owned a factory at Poughkeepsie, New York. It stood directly across from Vassar Hospital, and, one way and another, he became a trustee, and a valued friend of the doctors in charge. Surgeons as a class are frequently working out hobby gadgets in their spare time, and when these Vassar doctors had mechanical problems they came to George Lane. He found helping them a pleasant relaxation. One of the staff, Dr. John E. Patterson, a dentist, was a camera enthusiast, with

**Installment 54.—Those were days crowded with high adventure when the promoters of modern talking pictures discovered the fascinating new world of films in churches and schools**

an idea for a stereoscopic motion picture. Lane thought well enough of both man and idea to join Patterson in developing the machine. They worked it out with sufficient success for the Eastman Kodak Company to become interested—but that, again, is another story.

One evening Lane and Patterson were present at a hospital lecture delivered by a speaker from the American College of Surgeons. The lecturer mentioned the great value there would be in having stereoscopic pictures of operations, and, when the talk was at an end, Lane and Patterson showed him their apparatus. It had color possibilities, too, and that naturally would interest any surgeon. The lecturer was definitely impressed. They asked him how they might go about making the device useful in the way he had indicated. He advised them to see Carpenter-Goldman. Lane followed the suggestion, discovered the inventor's fairyland which is to be found in any busy animation studio, purchased Carpenter's interest and became a member of the firm. After that he took a hand in numerous experiments in surgical photography, using not only his own machine, but cameras built for the Kinemacolor process, made available to the firm through its association with Charles Urban.

There was much cautious parleying before Erpi and Carpenter-Goldman came to terms, but the direction of the tide was sufficiently clear to Goldman, Coffman and Lane for them to see that they would profit by fostering the connection. They knew, moreover, that the first commitment would have to come from Erpi because Erpi would need pictures and had no complete facilities of its own for making them.

## Sauce for the Gander

WITH life mounting and pulsating in all its members, development appeared without warning to Erpi in many places, and, as it happened, production began in the sales division. In that quarter there inevitably had arisen a reproachful criticism to the effect that, "Here we are, recommending the use of talking pictures to everybody else and haven't one of our own." So it was decided to produce a reel to answer the burning popular question of the hour, "How do they put the sound on the film?"

P. L. Thomson, of Western Electric, was much in evidence at Erpi then, because all of the precious Erpi equipment was being manufactured by his division of the Bell System, and, of course, Western Electric was the parent company. Naturally, this irregular but insistent question of production focussed presently upon the Western Electric Motion Picture Bureau, where Charles Bar-

Urban's Spirograph embodied one of the most intriguing principles ever applied to short movie exhibition—its pictures on a disk.

rell was doing so splendid a job. Barrell, with Walter Pritchard as cameraman, had lately produced an effective two-reeler on laying the new Western Union cable from Newfoundland to the Azores, "Business in Great Waters," scored it with a lecture, music and effects and booked it readily in a long list of first-class theatres.

But what should the new picture be? Many, myself included, tried their hands at it under Barrell's supervision, and eventually all the suggestions were combed and combined to make the scenario of an animated cartoon. This, of course, was playing directly, naturally and I am sure properly, into the hands of Goldman. The theme was the pitiable situation of the silent motion picture, symbolized by a caricature figure, and the plot consisted of its adventures in trying to become articulate. It was called "Finding His Voice." When completed it became one of the most popular short subjects of the time, and was screened in virtually every important theatre in the country. Today a print of it is kept at the Museum of Modern Art in New York as a milestone of progress in motion picture development. As Barrell did not personally produce cartoon animation, the work was referred to Carpenter-Goldman and by them to Max Fleischer and his gifted "gag-man" brother, Dave. The sound—voices, music and "effects"—were added in the small but highly practical New York studio of the Paramount newsreel. The voice of "Dr. Western," to whom the silent picture was taken for diagnosis and who explained the essential facts about how they put the sound on the film, belonged to Carlyle Ellis.

Herbert M. Wilcox, engineer in charge of theatrical installations for Erpi, then found need of further subjects to educate the customers, and it was decided to produce two single-reelers covering, respectively, the manufacture of the sound equipment in the great Hawthorne Works of the Western Electric Company at Chicago, and the scientific aspects as shown in the daily routine of the Bell Telephone Laboratories in New York. I assisted Barrell to make the Chicago subject, and was left alone to produce the second. At the suggestion of Wilcox on the first and of P. L. Thomson on the other the narrative voice in both cases was my own, a fact which was to lead to some embarrassment later, when some experimenting, amateur psychologist insisted that it was very disturbing to an audience to hear a voice without seeing the source, and I was obliged to don the makeup of a clothing-store dummy and appear in person for a space after one main title, thereafter being permitted mercifully to fade out and, like that legendary Greek, be a voice only.

Education of exhibitors through this great new vehicle of the talking film was not to stop with the laboratory and factory revelations, but was to go on into the placement of projectors, monitor horns and all the other features of installation. In such explanation previously a kind of

corporation celebrity had been gained by W. W. Symons, one of the regional managers; and he was assigned to see the matter through.

Symons did very creditable work considering his inexperience as a scenarist, but, by appearing personally in the films as the Bell System engineer who answered all and sundry questions put by a hypothetical theatre manager, when neither questions nor answers could then be fully practical, he exposed himself to later derision, and the subjects were soon discarded as obsolete. Direct supervision of these particular productions was given to Joseph Coffman, and the making was first in the Fox Studio, on Tenth Avenue, not far from the Fisk Building, and then, as Carpenter-Goldman became more settled in their quarters over the river, in the monk's-cloth-draped studio in Astoria. Coffman was also heavily engaged in producing subjects on the acoustics of the sound film featuring formal lectures by Bell scientists notably Dr. Harvey Fletcher who had been conspicuous in perfecting the talkie system, with pointers, charts and other illustrative apparatus. The technique was of the true lyceum variety, with table, water-pitcher and glass, and the speaker in full dress.

One speaker who became a veritable martyr, was amiable Howard Santee, protégé of John Ling, executive vice-president of Erpi, one of the liaison officers between the Bell Laboratories and Erpi. Santee was surprisingly young for one of so much authority and, being small in stature beside, invariably brought chuckles from the audience when he began one of his reels with a speech written, I believe, by Coffman, starting, "When I was a small boy, little did I dream that the

**"Finding His Voice" was Western Electric's way of initiating playgoers into secrets of modern talkies. Max Fleischer did the cartoon; Carlyle Ellis spoke for the doctor.**

time would come when I would be drawing acoustical rabbits from the hat of science." When Santee was trying to memorize this imposing speech, which had to be recited all in a single "take," he spent most of one afternoon kicking around the studio damning the rabbits.

In these days of complete flexibility of the sound equipment, it is difficult to realize how rigid the requirements were then. Cameras were locked in ponderous, sound-proof "ice-boxes" which were nailed to the floor, and supplemental cameras,

(c) Baehraeh

**Col. Frederick L. Devereux's whole-hearted enthusiasm for talking pictures in education was undeniable. Under him Erpi made school films.**

sufficiently difficult to procure for any purpose, were anchored in fixed positions for additional "angles." It took about twenty-five feet of 35mm film to bring the cameras up to speed, with synchronization marks and other identifications, and twenty-five feet more to bring it down with more marks; and, once started, the technicians preferred not to stop until a full thousand feet had been shot by each camera. "Playback" records were made for alleged tests of sound quality, the slightest cough, hesitancy or corrected slip of enunciation, now hailed as proof of naturalness, occasioned a retake, and "dubbing" separate sound-tracks or phonograph records together was frowned down as utterly destructive to sound quality, which, in the province of the Bell System, especially, must never be permitted to fall below standard.

Consequently, in a picture requiring speaker, orchestra and other sound effects, all were staged at the same time, and a mistake anywhere, even a trivial one, meant that the whole thing had to be done over again. Over and over again, to eliminate the sounds of passing trains, noon whistles, droning airplanes and children on roller skates bribed to keep out of the alley. This cost plenty of money, too; but when they speak slightly today about how expensively the first talkie directors worked as compared with present ones, remember that the short cuts fully approved in this late year, were not countenanced then.

A modern talking picture has its sound-track, as the sound record is called, printed photographically down the side of the film beside the successive images. For separate attention in development, and convenience in editing, the sound-track is recorded, wherever practicable, on a separate film, the negative image and negative sound-track being combined in the printing stage on the single positive used in projection. Obviously, the relationship of sound and image must be maintained, or synchronization is lost.

Nowadays, when careless cutting has caused loss of synchronization, it is easily restored by running prints of the separate negatives side by side on a handy test machine called a double moviola, which permits them to be moved individually backward or forward until they are properly juxtaposed. The usual method of restoring synchronization in the early days was to try visually to "read" the sound track, then to make a combined trial print for projection on a regular theatrical machine, and next to hold projection-room conferences in which informal votes would be taken on whether the sound was three frames too early or four frames too late. Sometimes there were nearly a dozen combined prints before the approved junction was obtained. I have a clear picture, on the tables of my memory, of Joe Coffman seated in the laboratory before one of the measuring contraptions which he was forever inventing then, triumphantly identifying middle C on a sound-track as corresponding with the image where a musician at a viola brought his bow in contact with his instrument.

Coffman's conscientious application to all of these problems, his inventions (I believe that he had much to do with invention of the desitometer) and his authoritative manner as director on set, all combined to give him an appreciable fame; and when the heads of the Bell Telephone Laboratories, convinced that this talking picture by-product really was important and far-reaching, decided to build an adjoining, complete experimental motion picture studio and laboratory, Coffman's advice was sought on the entire construction. This was about the time "Finding His Voice" was going into production, and I chanced one day to be visiting the Carpenter-Goldman Laboratories to discuss my tentative script for it. Our conversation led to the subject of the proposed new studio, and I told Coffman about a pet notion of my own for an economical stage construction in which the usual rectangular space would be divided by a diagonal wall to make two stages, instead of one. Coffman incorporated it in his plan and, although the Bell engineers lost heart and modified it, one of the two stages in the structure which ultimately arose on Bank Street was built in triangular form. For the benefit of visitors who have wondered why, this is the probable reason.

With the completion of the studio, the sound tests of the experimenting engineers became more elaborate, and they decided that they should work with conditions more closely approximating those of the professional producers. So Walter Pritchard, who had photographed telephone films for Carlyle Ellis and for C. W. Barrell, was taken on by the Laboratories as official, resident cameraman.

For a time nearly all talking pictures were made indoors on the allegation that sound could not be controlled properly outside, and the background was monotonously a set of monk's cloth curtains rated to be without reverberation or echo. But heretic professional producers in Hollywood insisted that they had to have

built scenery, actually using some of it in their theatrical talkies, so the Bell engineers reluctantly decided to yield on that point, too. The Fox-made Hollywood feature, "In Old Arizona," starring Warner Baxter, was a nine days' wonder because most of its scenes had been photographed with "original sound" out-of-doors.

### The Colonel and His Men

OF COURSE, the Erpi non-theatrical plans threw heaviest stress on educational films. Schools were to constitute the large market there. So, when the non-theatrical offshoot of Erpi was formed, in January, 1929, it was known as the Educational Department. Placed in charge of it was Frederick L. Devereux, for many years an officer in the American Telephone & Telegraph Company. He came as a stranger to the non-theatrical field, and with no previous acquaintance with motion production or distribution of any sort; but he had a deep personal interest in education. He had won an A.B. at

Blackstone

**Dr. N. L. Engelhardt came to Erpi's educational committee as one of the country's best known authorities on how schools are organized.**

Gonzaga College in 1902, when he was twenty years of age, an LL.B. at Georgetown University in 1906, and a Ph.D. from the latter institution in 1917. And he had had an even stronger reason for keeping abreast of new trends in pedagogy as the widowed father of a growing son and daughter. His business training had been in financial divisions of telephone work, culminating in his place as vice-president of the Bell Telephone Securities Company. Shortly after Erpi began, Walter S. Gifford, president of the A. T. & T., presented him with the 35-year medal of service to the System. In World War Number I he was a lieutenant-colonel on the General Staff of the U. S. Army, and subsequently ranked as a colonel in the Officers' Reserve.

To assist Col. Devereux in the new Erpi organization was chosen Howard Gale Stokes, of the motion picture de-

partment of the A. T. & T., a man familiar with both the film industry and the Bell policies. Moreover, Stokes, it will be remembered, had produced the first talking picture made by the System. Stokes was happy in his place and was not anxious to come to Erpi, but he consented under pressure and with the understanding that he should have time out to attend the international advertising convention that summer at Berlin.

Knowing how tentative everything necessarily was at the time, he persistently declined a title until some designation became important to promotional literature, and then he chose the sufficient but wholly ambiguous one, "Development Manager." Under this his duties and position might change indefinitely, and, to be sure, as later events soon proved, his work really was developmental. He was succeeded in his film work at the A. T. & T. by his former assistant, Jerome M. Hamilton, with Carlyle Ellis in charge of actual production. Ellis had given up his business and had gone to work exclusively for the A. T. & T. nearly a year before.

Quick preliminary surveys and presumably authoritative advice had given Col. Devereux the usual assurance that there were no real school pictures in existence, and, of course, there were no talking pictures of this type. So he realized (and was a little grateful for the opportunity, too) that it was necessary to start in this department virtually from the bottom. Among educators, by now, the custom had grown to approach matters of this sort in committees, each composed of representatives of the different educational branches. There especially had to be an expert on elementary schools and one on teacher training. Educational pictures aim principally at the range from the fourth or fifth elementary grade through junior high, and are rather neglectful, perhaps, of primary and college levels save in "normal" schools. This range was and probably still is commonly accepted as representing the great mass audience in this phase of non-theatricals.

The Colonel lived in the pleasant Westchester suburb of Bronxville, where he was a village trustee and a deservedly respected citizen. In later years he was to be the mayor. Bronxville schools had a high rating among educators for employment of advanced techniques, the applications of which were usually "in co-operation with" Teachers College of Columbia University. So, when the Colonel discussed some of his problems with friends among the Bronxville schoolmen, he was referred to Columbia as a proper, authoritative source of good advice. At Columbia his first profitable contact seems to have been with Dr. Nicolaus Engelhardt, professor of education at Teachers College. Engelhardt dissuaded the Colonel from his first, tentative idea of establishing a committee of five or six prominent educators as probably too difficult to bring together when needed and subject to too many varieties of individual opinion, and the number was presently limited to three.

(To be continued)

## Two Important Audio-Visual Education Meetings

### Northern Ohio Visual Aids Conference

THE first Visual Aids Conference ever held in northern Ohio will include addresses by Frank J. Lausehe, Mayor of Cleveland, School Superintendent Charles H. Lake, and experts from the Ohio area and elsewhere in the country. The conference will meet April 3 and 4 in Hotel Hollenden, Cleveland, for a series of practical demonstrations of the latest methods of teaching with modern visual aids. The notably fine program, nearly completed, is printed below.

Director M. R. Klein, of the Educational Museum of the Cleveland Public Schools, is general chairman of the Conference. He has arranged also an exhibit of new equipment and supplies. The committee on arrangements hopes to make the conference an annual affair, in cooperation with Zones III and IV of the Department of Visual Instruction of the National Education Association. Attendance is cordially invited from all States within war-time travel radius.

#### THE FIRST NORTHERN OHIO VISUAL AIDS CONFERENCE

In Co-operation with

The Department of Visual Instruction (Zones III & IV)  
National Education Association

Monday and Tuesday, April 3rd and 4th, 1944  
Hotel Hollenden Ballroom, Cleveland, Ohio

#### PROGRAM

FIRST SESSION, Monday Afternoon 2:00 P.M.

Max R. Klein, General Chairman

- Visual Aids in a Children's Museum (Illustrated)  
Margaret M. Brayton, Curator, Children's Museum, Detroit, Michigan
- Pupil-made Slides as an Aid to Integrating Activities in Elementary Education (Illustrated)  
Mrs. Edna Moore Skelly, Principal, Standard School, Cleveland
- Silent Films as an Aid in Teaching Elementary School Pupils  
Agnes McFadden, Principal, Union and Tod Schools, Cleveland
- The Art Museum Comes to the School (Illustrated)  
Dr. Thomas Munro, Curator of Education, Cleveland Museum of Art
- Visual Aids of a Progressive Zoo, (Illustrated)  
Fletcher A. Reynolds, Director, Cleveland Zoo

SECOND SESSION, Monday 8:00 P. M.

- Greetings—Hon. Frank M. Lausehe, Mayor, City of Cleveland; Charles H. Lake, Superintendent, Cleveland Public Schools; Mrs. Camilla Best, President, Department of Visual Instruction, N.E.A.; Joseph F. Landis, President, American Federation of Teachers.
- Address—(By a Representative of the Motion Picture Producers and Distributors of America, New York)
- Your Film and Slide Exchange in Ohio  
B. A. Aughinbaugh, Supervisor, Film and Slide Exchange, Department of Education, Columbus, Ohio
- New Techniques of Visual Training in the Armed Forces  
Commander Patrick Murphy, Chief, Training Aids Section, United States Coast Guard, Washington, D.C.
- Teacher Training in Visual Education—When Do We Start?  
Dr. Edgar Dale, College of Education, The Ohio State University, Columbus

THIRD SESSION, Tuesday 9:30 A. M.

- Visual Aids in Art Activities (Illustrated)  
Alfred Howell, Directing Supervisor of Art, Cleveland Public Schools

Through the Window Pane—A Robin's Spring Story (Colored Film with Music on Disc)

Mrs. Warner Seely, Cleveland Heights

Classroom Methods of Using Sound Films—A Demonstration Motion Picture Project Report

Miss Helen Hardt Seaton, Executive Secretary, Motion Picture Project, American Council on Education.

Motion Pictures in a Modern High School

L. K. Meola, Coordinator of Visual Aids, John Hay High School, Cleveland

Luncheon, Tuesday Noon, Coordinators of Visual Aids in Schools and Guests

FOURTH SESSION, Tuesday 2:00 P. M.

Visual Aids in Teaching Music Appreciation (Illustrated)

Lillian L. Baldwin, Supervisor Music Appreciation, Cleveland Public Schools

Practical Suggestions of Visual Aids in an Elementary School (Illustrated)

Adela M. Losch, Principal Miles and Cranwood Schools, Cleveland

Visual Aids for Industrial Arts Education (Illustrated)

Carl H. Hamburger, Supervisor Industrial Arts, Cleveland Public Schools

A School Produced Colored Film with Sound on Disc—A Guidance Project

Anthony L. Cope, John Hay High School, Cleveland

FIFTH SESSION, Tuesday 8:00 P.M.

A Filmstrip and Follow-up for a War Training Class

Joseph A. Roenigk, Cleveland Trade School

Microprojection for Biology

Sterling O. Wilson, Collinwood High School, Cleveland

The Use of Pictorial Material in a Progressive Church School

Robert J. Holden, Director, First Unitarian Church School, Cleveland

### A Letter from the President of Zone II

Dear Members and Friends of Zone II:

Visual education is being utilized in all branches of our armed forces and in pre-induction courses. Many of the films and other aids of the government and much of the recent visual education material of other organizations are needed in our schools at this time. Therefore Zone II Department of Visual Instruction has planned this meeting in *Visual Education Today and Tomorrow*, to be held concurrently with the Association of School Administrators in the Hotel New Yorker, February 23, at three thirty o'clock. At that time some of the latest phases and materials in visual education for the schools will be discussed and shown.

Plan to attend this meeting and invite your friends also. Come and renew friendships, meet other folks interested in visual education in the schools, and enjoy an interchange of ideas.

(Signed) E. WINIFRED CRAWFORD

#### Officers of Zone II—D. V. I.

President—Dr. E. Winifred Crawford, Board of Education, Montclair, N. J.

1st Vice President—Mr. H. A. Humphreys

2nd Vice President—Dr. Dean F. McClusky

Secretary-Treasurer—Mr. James S. Kinder

#### Officers of Metropolitan New York Branch

President—Dr. Lucile Allard

Executive Secretary—Mrs. Lena Hessberg

Recording Secretary—Mrs. E. L. Berg

Treasurer—Mr. Don Carlos Ellis

Chairman, Executive Committee—Rita Hochheimer.

## P R O G R A M

**Zone II Department of Visual Instruction  
National Education Association  
held concurrently with**

**The American Association of School Administrators  
in New York City**

**Wednesday, February 23**

Hotel New Yorker, Parlors F and G

Mrs. Esther L. Berg, Chairman

Theme—*Visual Education Today and Tomorrow*

Dr. E. Winifred Crawford, President Zone II, Presiding

Greetings from Dr. A. L. Threkeld, Superintendent of Public Schools, Montclair, New Jersey

Visual Aids in the Armed Forces (with film showing)

Lieutenant Lyle Stewart, Senior Utilization Officer, Audio-Visual Training, United States Navy

School Opportunities in the War Time Situation (with film)

Mr. Floyd E. Brooker, Director, Visual Aids for War Training, United States Office of Education

Report of National 16mm Advisory and Policy Committee of the Office of War Information

Mr. L. C. Larson, Chairman

Production of Motion Pictures for Inter-American Understanding with showing of films "Montevideo Family" and "High Plane"

Mr. Julien Bryan, Lecturer and Documentary Film Producer

Concluding Remarks—Outlook for Tomorrow

Dr. Lucile Allard, President, Metropolitan New York Branch, Department of Visual Instruction

### EVENING SESSION

Informal Dinner—6:30 P. M. Price \$2.50

Town Hall Club, 123 West 43rd Street

Miss Rita Hochheimer, Presiding

Preview of "Adventures of Mark Twain"—8:45 P. M.

Warner Bros. Studio, 10th floor, 325 West 44th Street. Admission by ticket only. Tickets up to capacity of studio will be sent free to members and guests on application.

(Reservations for dinner and film preview should be made with Mr. Don Carlos Ellis, 21 W. 46th Street, New York, 19)

## Photography in the High School

(Concluded from page 61)

cists, astronomers, medical men, zoologists, botanists, teachers, and others have found photography to be a useful, and in some cases, an indispensable tool in their respective fields.

It is not expected that the more specialized uses of photography will be of great value to the high school pupil, but even the more simple photographic skills may serve as tools in many secondary school areas.

In the natural sciences, for example, pictures of plants and animals are always useful in the study of these subjects. A simple photomicrographic outfit might be made with an ordinary box camera, a microscope, and a few accessories. The social science classes may plan a project of social documentation in the community, picturing with cameras, some phase of community life such as housing, sanitation, traffic safety, or the functions of civic departments. The physics student could study spectroscopy using the camera and the sensitive plate. Language classes could illustrate themes with pictures or write compositions from a picture or a set of pictures.

As an educational tool, photography is the very heart of the school visual aids program. From the photograph made by student or teacher, lantern slides or film strips may be made and added to the library of materials. Furthermore, school plays, P.T.A., and class activities may be advertised by means of the photograph. Dramatics teachers have found it profitable and time-saving to photograph the sets of school plays so that these sets may be quickly reconstructed at a later date. Many school magazines make use of pictures taken by students, and some photography clubs make the putting out of the school annual one of their major functions. Industrial arts students may make photographs to accompany blueprints of projects they have completed and place these on file for the use of other students.

In short, while we need not teach high school students how to handle the highly technical processes of photography, we can make photography useful in the classroom in almost every subject, and at the same time show how this tool has contributed to the development of modern civilization as a whole.

### Objective 7. To Encourage Desirable Habits of Work

Success in photography is not ordinarily achieved by random picture making and careless laboratory practice. Certain traits and work habits which are necessary for the best quality of work in photography are listed below. Most of these traits and abilities are important in all fields of endeavor. The teacher should make this clear, and should teach for transfer.

- a) Observation. The ability to see pictorial possibilities.
- b) Cleanliness; essential from loading the camera to presenting the print.
- c) Accuracy; in making measurements, focusing, timing, and the like.
- d) Neatness; especially important in preparing work for exhibition.
- e) Ability to meet people and to deal with human subjects.
- f) Originality. The ability to present ordinary subjects from a fresh point of view.
- g) Pride in craftsmanship.
- h) An active, inquiring mind.

Whenever the worker in photography grows careless or hasty in his work, the results are immediately evident in the product of his labor. No preaching on the part of the teacher is necessary to make the student see that his work is poor, for concrete evidences of faulty craftsmanship appear for all to see. On the other hand, a well-mounted, properly exposed and developed print is material evidence of a good piece of work, and the student immediately enjoys the reward of careful craftsmanship.

In view of the above objectives, it should be evident that a photography program can contribute richly to the aims of general education. Certainly, the possibilities of instruction in this subject merit the consideration of all educators interested in the visual education field.

# THE NEW ENGLAND PAGE

## Conducted by

The New England Section (Zone 1) of the  
Department of Visual Instruction of the  
National Education Association of the U.S.

Editor, JOHN H. LYONS

## Officers of The New England Section

*President*, Edward F. Wheeler, Department of Education, Bristol, Conn.

### A Message from Our President

WE of the New England Section, Zone 1 of the Department of Visual Instruction, are pleased at the opportunities provided by this space in Educational Screen. At the present time, when many meetings are being cancelled due to problems of transportation, and when the majority of us are over-worked, due to the pressure of war duties added to normal responsibilities, it would seem that an efficient method of exchanging ideas is of tremendous value. Both now, and in the future, truly effective teaching is going to be more essential than ever before. Such teaching can be attained, in many cases, only by intelligent use of audio-visual aids. It would seem, then, that all our efforts should be directed towards developing this field as rapidly and as thoroughly as possible.

As an aid to such development, this page is of extreme value. May I urge, therefore, that each and every New England educator who is actively interested in the field of audio-visual education, contribute at least a small part of his experience to this page for the common good of the field. **You will be doing a real service by sending the editor of this page a short account of your experiences, regarding profitable use of audio-visual aids.**

Edward F. Wheeler

### Connecticut Schools Active in Radio

The use of radio as an educative medium has reached a new high in Connecticut this past year. At the present time there are over fifty-two schools taking an active part in the C.B.S. American School of the Air broadcasts that emanate from Hartford's WDRC.

This program started over six years ago when Sterling V. Couch, Educational Director at WDRC, asked some of the neighboring schools to carry on a student discussion following the program entitled "This Living World" rather than to listen to the student discussion that came from New York. This program called for our station to have its own student group representing a Connecticut High School. At first a group of from four to six students representing one school would carry on the discussion. It was later decided to change this to two groups of four each from two different schools. This idea resulted in a lively and interesting clash of opinion. Since none of the students is allowed to use notes or a script the entire program is unrehearsed and extemporaneous. This provides excellent training for the more than 208 students who take part in this program. Each school usually takes part in two programs each year. In most cases only one pupil of a group has previously broadcast and very often an entirely different group represents a school at each broadcast.

This broadcast has now become so popular that its audience rating is higher than many of the regular evening programs. At the present time there are about thirty stations on the network who have this type of local program. There are only four or five in New England.

**An innovation by New England—a page of its own for telling its own story.  
Let the nine other DVI Zones read, weigh, and act accordingly.—N.L.G.**

### Bangor Projectors Club Solves Many Problems

Principal Russell I. Mograge of the Fifth Street Junior High at Bangor, Maine, gives us the following report on his "Projectors Club".

"Operators for Audio-Visual apparatus are trained by our Projectors Club. There are thirty-four students from grades seven, eight and nine enrolled as members. This club is included in the Activity program with meetings held during the school day.

"Mr. Walter Witham, instructor in metal work and a projectionist of professional experience, acts as sponsor. Members of this club receive instruction in the details of construction for each type of machine. They arrange programs and act as helpers or operators. Thus we have the services of reliable operators at any period with a minimum of interference with individual programs.

"In addition to solving the operator problem there are many incidental outcomes that have been outstanding:

1. Teachers are using visual aids more frequently and to better purpose when relieved of the responsibility of operating the machine.

2. 'Running the Picture Machine' is a highly coveted privilege. In several cases it has served as the means for the happy solution of a so called 'problem case'.

3. Student response to programs operated by members of their own groups has promoted a more wholesome attitude toward the entire plan."

### Springfield Schools Plan to Build Kodachrome Units

Under the direction of Ralph A. Stout, Supervisor of Audio-Visual Aids for the Springfield schools, plans are being made to develop a library of 2x2 kodachrome slides.

With this idea in mind a teacher's committee was organized to develop a unit on the Springfield police force. This committee met with the police officials, had a tour through their departments, and then came back and submitted a series of shots which they considered important in presenting this unit. The unit has been broken down into two sections, one for the kindergarten and first grade pupils and the other for the sixth grade level and adult education groups. The committee is taking its own pictures and when the collection is completed the same committee will write a teachers manual to accompany these slides.

Springfield does not intend to discard its 3¼x4 slides. They have just completed the task of checking over their entire collection. All antiquated slides have been discarded with all those that remained being collected and formed into teaching units.

### Fitchburg High Dramatic Club Sponsors Visual Aids

The Dramatic Club of Fitchburg High School under the direction of Miss Anna E. Dunn has been playing a major role in developing the Audio-Visual Aids program in that school. This club has made it possible for the school to present feature films of educational value. They have presented outstanding speakers, actors, and exhibits. This one club has become so popular in the school that its membership has reached the grand total of 450 during this school year.

**1,742  
LIGHTED PICTURES  
LIGHTEN THE  
LOAD**

**1742 Pictures in 24 Slidefilms**—One thousand seven hundred and forty-two (1742) original pictures, photographs, cross-sectional views, drawings, diagrams and charts comprise this Jam Handy Kit-set of 24 Pre-flight Training Slidefilms. Each picture “talks to the eye,” presenting information quickly, clearly and easily. Hundreds of Jam Handy Pre-flight Aeronautics, Pilot Training Kit-sets are now in use in the leading schools and colleges throughout the country—making the teacher’s job easier, helping students to grasp technical points quickly.

**Easy To Use**—The slidefilms provide a complete step by step visual explanation of each phase of aviation. They carry textual captions designed to be read aloud to enrich meanings and to provoke discussion. Each picture can be held on the screen until difficult points have been made clear to every student in the class.

**Try These Slidefilms in Your Classes**—You may see for yourself the value of this Jam Handy Pre-flight Aeronautics Kit-set. If you are teaching Pilot Training, mail the coupon below to learn how you can have a free ten days’ trial in your classroom. Or, if you wish, you may order the complete set of 1742 pictures in 24 slidefilms for \$65.

## Pre-flight Aeronautics Visualized

“The Jam Handy Pilot Training Kit-set is the most valuable teaching aid for primary pilot training I have ever used. Students progress rapidly with these visual aids.” This is typical of the many, many favorable comments from instructors using the Jam Handy Pre-flight Aeronautics Kit-set.

**THE JAM HANDY ORGANIZATION**

B 24

**2900 East Grand Boulevard, Detroit, 11, Michigan**

Please enter our order for the Pre-flight Aeronautics, Pilot Training Kit-set.

Please send me without obligation full details on how I may try out this Kit-set in my own classroom.

# The Film and International Understanding

## An Operating Film Program for International Understanding of America

THE Overseas Branch of the Non-Theatrical Section of the Motion Picture Bureau of the Office of War Information is actively engaged in an international film program which aims to present a more favorable picture and to bring about a better understanding of the United States in the various areas of the world which it serves.

The audience for this film program is the civilian audience in all countries outside of the western hemisphere in which the enemy does not have control. This includes the civilians in Allied and neutral countries, as well as in occupied and liberated territory. In view of current military developments, these areas and audiences are increasing rapidly.

Although the program is strictly a war activity, the fact that it actually is operating in this field over such a wide area gives it even greater significance. Some consideration of its functioning may teach us something about the problem of increasing international understanding through the use of films, both now and after the war.

The program covers a wide range of territory and activities. It has control over the distribution of civilian films in occupied areas. For this purpose, it has a program for the training of operators and distribution promoters for this type of work, although as soon as it seems wise and possible, local civilian operators and distributors are encouraged to resume functioning.

Some educational and governmental agencies have films, all or parts of which are useful for the program. Arrangements are made for the utilization of as much as possible of this material. The Branch also issues a news reel of its own which is used in its program. Not the least of its activities is the production of films of its own.

Such a wide program involves the use of many different languages—twenty-two at the time of this report, including English. In order to overcome the barrier of illiteracy in any language, spoken comment is generally used in preference to printed sub-titles. Since dubbing in dialogue to coordinate with the lip movements in so many languages would be an impossible task, the foreign-language sound tracks in general carry comment rather than dialogue.

The twenty-two languages referred to above as in use in this program are: Afrikaans, Arabic, Bulgarian, Chinese, Czechoslovakian, Danish, Dutch, English, Flemish, French, German, Greek, Hungarian, Italian, Norwegian, Polish, Portuguese, Roumanian, Serbo-Croatian (Yugoslavia), Spanish, Swedish, Turkish.

### Films From Home for American Prisoners

American boys in war prison camps in Germany already have received the first shipment of 26 American motion pictures sent to them through the good offices of the War Prisoners Aid Committee

DR. JOHN E. DUGAN, Editor  
Haddon Heights, New Jersey, Schools

of the Young Men's Christian Association. The films will be distributed from the international headquarters of the World Committee of the Y.M.C.A., a neutral organization, in Geneva, Switzerland, in accordance with a procedure agreed to by Germany which will permit the showing of American motion pictures to Allied prisoners in German prison camps and German-made films to Germans imprisoned in the United States.

Final arrangements for the shipment of the American films were completed in December by Tracy Strong, executive director of the War Prisoners Aid of the Y.M.C.A., with the War Activities Committee of the Motion Picture Industry, the Army Overseas Film Service and the Office of Censorship.

Regarding facilities for showing the films, Mr. Strong said: "We have checked most of the prison camps and find that they have 16mm. projection equipment ready to project the films. . . . Between the International Red Cross, which looks after the supplementary food and clothing for war prisoners, and the War Prisoners Aid of the Y.M.C.A., which provides for the educational, recreational and religious needs, our boys are not forgotten when they become prisoners of war."

### Foreign Films for Language Study

An experiment in the use of French, German and Russian feature films to accustom language students to a wide variety of different accents and dialects is now under way in a group of Eastern universities where training in foreign languages is being given to service men under the Army Specialized Training Program.

The chief value of the foreign-language feature film, according to Prof. Ernest L. Hettich of New York University, coordinator of the Army Specialized Training foreign area and language programs, is that it offers the only available means of allowing the student to judge whether his knowledge of the language he is studying is sufficiently good to enable him to understand rapid dialogue.

Foreign-language instructors in the N.Y.U. language program follow up the use of these films by directing the conversation at the next class session to bring out whether the student caught and understood parts of the dialogue which were not given in English sub-titles.

The results of the use of these films may have a tremendous effect upon the methods and materials of foreign-language instruction in our schools and colleges after the war.

**Editor's Note:** The following motion pictures mentioned in our December issue in this section on "The Film and International Understanding", are released in 16mm. by the firms indicated: *April Romance*, *Beethoven*, *Gunga Din* and *Moonlight Sonata*, by Walter O. Gutlöhn, Inc., New York City; *Little Lord Fauntleroy* by Ideal Pictures Corporation, Chicago; *Nine Days a Queen* by Brandon Films, New York City.

*(The projected picture is an official U. S. Navy photo)*

# SCHOOL MADE MOTION PICTURES

**HARDY R. FINCH, Editor**  
Head of the English Department  
Greenwich High School, Greenwich, Conn.

**EDITOR'S NOTE:** Mr. David Schneider, acting head of the Biology Department of Evander Childs High School in New York City and an active worker in the field of motion pictures and still photography, will conduct the Question Box in succeeding issues of this department.

Mr. Schneider was graduated from the College of the City of New York in 1923 and received a Master of Arts degree from Columbia University in 1928. He has taught in the elementary and junior high schools of New York City. From 1938 to 1943 he was chairman of the high school Visual Aid Committee. He has produced two well-known films: "Evander's Chicks," for New York City high schools; and "They All Go to Evander," which is being circulated in Central America for the State Department. He assisted the Coordinator of Inter-American Affairs in producing "La Segunda Ensenanza En Los Estados Unidos," based on his scenario.

Readers of EDUCATIONAL SCREEN are invited to send questions on their film production problems to this department. Mr. Schneider will be glad to answer them in future issues.

## QUESTION BOX ON SCHOOL FILM PRODUCTION

**Question:** We have several hundred feet of film containing many excellent shots taken in the last few years during trips across the country. I know that these films could be useful in some of the geography classes of our school. I am told that the average title printed and made in the laboratory costs anywhere from twenty-five cents to a dollar. At that rate the sixty or more titles that we need would amount to about thirty dollars. Please tell us how we can make and develop our own titles, giving approximate costs.

**Answer:** The simplest and least expensive method of making your own titles is to photograph them on positive film, remembering that the finished film is no different from any negative, meaning that the original lights and darks are reversed. Black lettering against light background may be had with the regular titling outfits. If you like your titles white against a dark background—a combination easy on the eye—it is best to hand-print them in India ink on white cards. If your lettering is the kind that is not photogenic, you might resort to the typewriter, being doubly careful about the condition of your ribbon and the cleanliness of your letters.

As to the nature of each title, keep in mind the audience for which it is intended. In general the fewer the titles the fewer will be the breaks (both literally and psychologically) in the continuity of the film. In a good travel film the natural settings of road signs, railroad stations, entrances to national parks, or historical landmarks will serve, better than any manufactured title, as a continuity in its appropriate place in the film. Of course there will be need of explanations of important activities that may be going on in the film. In that case, if you intend to make it a teaching film, may I suggest that many of your titles be worded in the nature of thought challenging questions? For example, if you have scenes portraying logging activities, your questions might be on the identification of trees—the reasons why that particular area is best suited for logging—why this activity must be carried on only during certain parts of the year—or how the techniques used by the men are more efficient than others.

Another thing to keep in mind about titles is the language comprehensibility of your students. Here too economy of words, coupled with simplicity, should be the guiding rule.

As far as footage is concerned, it is best to keep in mind the speed of the slowest reader of your audience. A good criterion would be to read each title twice at your own normal reading rate, while the camera is photographing your title. It's better to have an extra foot or two of a title than be that much short.

To develop my own titles, I had a spool built in the school shop. The spool consists of two disks about ten inches in diameter, made of pine or any other wood available. This wood should be about one-half inch thick. About one-half inch in from the periphery of each disk, drill holes about  $\frac{3}{16}$  of an inch in diameter. These holes should be spaced about one and one-half inches apart on a circle concentric with the periphery of the disks. By means of dowel sticks to fit these holes the disks are now joined. The length of these dowels will vary with the amount of titling one may expect to do, and also with the length of the developing trays. In my own case 12 inch dowels cover both requirements. Through the centers of both disks runs a dowel about 22 inches long and about  $\frac{3}{8}$  or  $\frac{1}{2}$  inch in diameter. This gives the spool a handle on each side for rotation in the tray. Make sure that all joints are properly sealed, all rough areas thoroughly sanded, and the entire spool waterproofed with several coats of shellac or other agent.

Sectional view of drum for developing titles

Two small, thin nails (brads), spaced exactly the distance between the width of two sprocket holes of a single 16mm frame, are now placed on one of the dowels near each of the two disks. These nails will anchor the films at each end and also maintain proper tension while the spool is being rotated in the developer and hypo. Scotch tape may be used instead of the nails. Under a safelight in the dark room thread the exposed film spirally on the spool, emulsion side up, away from the wood. The important thing is to practice threading some old film in daylight to learn to control the spacing of the spiral and avoid overlapping of the film.

After experimenting with many developers I found that Kodak D-11 gives best results. If the film is properly exposed (positive film has very low emulsion speed) five minutes of development in D-11, followed by proper fixing should give excellent, clear titles. After the film has been fixed in hypo and washed in running water it may be left to dry right on the reel, or, if one prefers, each title may be separately cut and hung to dry in the usual manner.

<i>Estimated costs</i>	
2 rolls of positive film (200 ft.)	\$2.00
1 gallon D-11	.50
1 gallon Hypo	.50

<b>Total</b>	<b>\$3.00</b>
--------------	---------------

Since the average title runs to about three feet, the two rolls of film should yield at least sixty titles. The developer and hypo, if returned to their proper bottles after using, could be made to work for another two hundred feet of film. This would bring the original cost down to \$2.50 per sixty titles. D.S.

## Will Stokowski "swing it"?

BOOGIE WOOGIE and Barrel House are pretty tough competition for the average serious music course in high school. Unless boys and girls can "swing it," their minds won't reach out, as a rule, toward the finer music they could enjoy just as richly.

But Deanna Durbin and Leopold Stokowski changed all that with their famous hit picture, ONE HUNDRED MEN AND A GIRL. This story of unemployed symphony musicians brought together by lovely Miss Durbin in a triumph of wonderful music, led by the master himself, makes the audience as proud of fine symphony as are those who create it. Stokowski doesn't need to "swing it"!

Schools all over America—some very large, some very small\*—are finding out that 16mm feature-

length movies bring alive *all* subjects in the curriculum, whether music or history or geography or science. Auditorium showings, followed by classroom discussion, pay rich dividends in understanding, bring student and teacher together in mutual appreciation of the humanities *behind* the facts they are studying.

FILMS INCORPORATED's famous Study Guides—showing individual teachers how to get the most out of the feature programs you schedule for your school, are sent free with each program, on request. Our colorful catalog of both features and shorts is yours for the asking. Write for it today!

# The Literature in Visual Instruction

## A Monthly Digest

ETTA SCHNEIDER RESS, Editor  
New York University Film Library

### TRENDS

**MacLeish Asks Film Library for Nation**—*Motion Picture Herald*, 154: no. 4, January 22, 1944.

A project already under way by the Library of Congress, in cooperation with the Museum of Modern Art Film Library is that of selecting films that are to be preserved for historic value. The project is now operating under a three-year Rockefeller Foundation grant. Mr. MacLeish hopes to get financial support from Congress and from the film industry in continuing this work.

### UTILIZATION

**Measuring Film Usefulness**—Dr. Abram Vandermeer—*Business Screen*, No. 4, 1943-4.

Two major problems were studied in this experiment: whether or not a careful use of motion pictures would reduce the training time for lathe operators; and whether the learner is thereby given some technical information as a background for his work. It is noted that from 19% to 53% of their practice time was saved, or "with careful use . . . untrained workers can be expected to average from 22 to 104% higher output of acceptable product per working hour on the engine lathe at the outset if they are first prepared by educationally sound use of motion pictures."

Seven classes of lathe trainees were divided into two groups. One group was taught with sound films, and the other group without. Painstaking records were kept of the amount of time each student spent on each practice lathe job. The course was given at the Morton High School in Cicero, Illinois for new war workers at a naval ordnance plant. The course lasted six weeks, and was divided into the beginners' shop, the intermediate shop and the advanced shop. It is strongly emphasized that the films were effective because they were properly planned and timed to be used when the learner was ready for them.

**Free Movies in Harlem: An Experiment**—L. D. Reddick. Curator Schomburg Collection, 135th St. Branch, N. Y. Public Library—*Library Journal*, 68:981 December 1, 1943.

In an effort to attract the young people of the neighborhood to the library for wholesome entertainment and reading, a pioneer effort was undertaken in using motion pictures. The article describes the plans and some of the disappointments en route. One of the outcomes, for example, was that children of elementary school age came in great numbers, but the adolescents for whom the showings had been planned were very few. The author offers some advice to others who may want to undertake library film showings: have adequate funds, preview all films, provide free time for a staff member to plan and direct the program, seek active support from other community agencies, and explore further the possibilities of films and reading.

### FILMSTRIPS

**Filmstrips Today and Tomorrow**—J. Raymond Hutchinson, chairman, Committee on Television, Department of Secondary Teachers, N. E. A.—*School Executive*, 33:60, January, 1944.

This report on the present status and future possibilities of the filmstrip in education lists the following facts as evidence of future growth: 1) more than 5,000 high schools use preflight aeronautics kits; 2) titles are available for almost every aspect of basic training; 70% of aircraft manufacturing plants, large and small, use them; 60% of the training of the armed forces is visual, much of which is the filmstrip medium; 5) plans for new schools include

darkening facilities, outlets in each room, and so on; 6) boards of education are buying the strips and projectors requisitioned by teachers; and 7) it is recognized that filmstrips will aid in rehabilitation and re-training at the end of the war.

### FIELD TRIPS

**Field Trips in Government Courses**—Edna M. McGlynn, Salem Teachers College, Mass.—*Social Education*, 8:19, January, 1944.

A course based on Beard's "American Government and Politics" at this teachers college is very largely dependent upon first-hand experience for its content. The class meets for three periods a week, with one session devoted to the textbook and current events discussion; one for the field trip, and the third for follow-up discussion and tests.

Places to visit are classified according to local, federal or state agencies. The Boston Post Office, Customs House, Social Security Office, Coast Guard, etc. are some of the national offices visited; the state house, state prison, state employment agency, and other similar institutions represent state services; for local government, the class visits the court house, city hall, town meetings. The instructor has found that required readings are more enthusiastically carried on after a field trip, and long after the students are out of school—and in the Army—there are personal anecdotes about experiences that have greater meaning because of the field trips. Similar trips are recommended, with adaptations, for secondary-school students.

### PRODUCTION

**Film News Survey of Film Demand**—Etta Schneider Ress—*Film News*, January, 1944, p.6-7.

The results of a letter sent out to 21 representative educational film library directors, requesting the following information: 1) In which subject matter areas are you receiving the greatest number of requests for films which are not as yet available?, and 2) Within this area, what are the general topics for which you are receiving most requests for films from your teachers and adult leaders?

Eleven replies were used in the consensus of topics listed. It is pointed out that several persons replied with the general appeal that many films are needed for special audiences—as adult groups; handicapped boys and girls; discussion-type films and so on. Subject matter areas mentioned most frequently were: health, nutrition and hygiene; home economics; citizenship education; history; science; mathematics and so on.

### RECORDINGS

**Radio Transcriptions in the Classroom**—William N. Steinberg, Benjamin Franklin High School, New York City—*High Points*, 25 no.10: 61, December, 1943.

A weekly feature of the English Department of the modern Benjamin Franklin High School in New York City's east side is the broadcast of a transcription over the public address system for 15 minutes each week. The program is announced throughout the day when the program is given.

Transcriptions are selected from the Federal Radio Education Committee's catalog and from a bulletin on War and the Curriculum Workshop on Radio Broadcasting distributed by the Board of Education. The programs are chosen for their value as a basis for discussion. Several episodes from Douglas Miller's "You Can't Do Business with Hitler" were chosen (available free from the U. S. Office of Education). Teachers can come and hear the recording the day before. The technique for presenting the

(Concluded on page 82)

*Spencer GK Delineascope used by Air Force Technical Training Corps, University of Chicago.*

## Seeing and Learning *Quickly*

In the first 28 months of its existence since March 1941, the Army Air Force Technical Training Command turned out more than 500,000 ground and combat crew technicians. An amazing total contrasted with the record of the preceding 20 years during which the Army Air Corps had graduated only 14,803 such technicians.

One factor which is helping to instruct such unprecedented numbers in so short a period is the use of visual

methods. Spencer Delineascopes are in daily service in this vital work.

**Spencer** LENS COMPANY  
BUFFALO, NEW YORK  
SCIENTIFIC INSTRUMENT DIVISION OF  
AMERICAN OPTICAL COMPANY

broadcast is as follows: The teacher in charge broadcasts an introductory statement and directs attention to important aspects of the program. The classroom teacher conducts follow-up discussion after the broadcast.

It is found that the boys of the school look forward to the programs, and that teachers of other departments report much carry-over of interest. In any case, the purposes of the English teacher in providing practice in attentive listening and in free discussion, are satisfactorily served.

**Let's Help You Find it: recordings for classroom use—**  
Emilie Haley—*Progressive Education*, 20:263, December, 1943.

A classified listing of recordings for sale and rental in both 33  $\frac{1}{3}$  r.p.m. size and 78 r.p.m. for use in high school social studies, English and drama.

#### SOURCES OF INFORMATION

##### Biological and Physical Sciences in Schools of Nursing:

**Selected Films**—Loretta Heidgerken, Catholic University, Washington, D. C. Educational Film Library Association, 45 Rockefeller Plaza, N. Y. 20, N. Y. 50c 37p. 1944.

An evaluated listing of films which met the standards of the author as suitable aids to instructors in nursing, and especially in biological and physical sciences for nursing students. The twenty-eight subjects included are the products of standard classroom film producers. Suggested ways of using each film are included in the evaluations.

**New Health Films**—Section on Health and Medical Films, American Film Center, 45 Rockefeller Plaza, N. Y. 20, N. Y. 6p. mimeo. January, 1944. 10c.

This is a supplement to the helpful bulletin published last year under the direction of Dr. Adolf Nichtenhauser.

**Let's help you find it: Science Helps**—Etta Schneider Ress—*Progressive Education*, 21:7 January, 1944.

A listing of some of the titles included in the recent "Bibliography of Visual Aids for Pre-Induction Training", published by the U. S. Office of Education, Washington, D. C. These represent some of the subjects in applied science that are available for science teachers and those concerned with pre-induction training.

**Aircraft Identification Classes in High Schools**—Lt. James E. Knauer, A.C., Ellington Field, Texas—*Sierra Educational News*—December, 1943. p.16.

A review of some of the materials available to instructors in the Air Forces who are concerned with teaching identification. Among the aids that are available are airplane models, filmstrips, slides, illustrated periodicals, training films.

**Films for Schools**—William J. Davies, Albuquerque, High School—*New Mexico School Review*, 23:4 November, 1943.

Sources of films within the state and some from outside found useful in this school.

#### PERIODICALS

**Our Minority Groups: Italian-Americans**, *Building America*, vol 9 no. 2.

A rare source of information on one of the fundamental problems with which every community is faced at present and will inevitably be faced in the future is the current issue of *Building America*. With photographs not usually available, the bulletin traces the story of Italian immigrants and their contribution to our culture, including the important part their sons and grandsons are playing in the war.

Several pages treat of the history of the Italian people and some of their folkways, revealing the background against which we should understand these people when they have migrated and settled in the newer, richer America. The conditions which faced them in the New World at the height of the immigration movement were appalling—sweat shops, low wages, crowded and unsanitary slum dwellings. The scene has changed considerably for the better among the present generation of Italian-Americans as they have broadened their outlook, acquired training and professional education and have taken their places in American life.

## Release More Visual Aids to Speed Up War Training

ONE hundred fifty U. S. Office of Education visual units for war training are now nearing completion, and as they are completed, are being released for purchase through Castle Films, Inc., New York City, the contract distributor for all Office of Education visual aids.

These visual aids which are making educational history by teaching workers essential skills motion by motion, supplement the original 48 U. S. O. E. motion pictures which have been in daily use throughout the United States, in schools, factories, and by the Army and Navy. Each unit includes a 16mm sound motion picture, a silent filmstrip, and an instructor's manual planned and produced to meet today's instructional needs.

Areas covered by these 198 war training films include machine shop work, shipbuilding skills, aircraft manufacturing skills, supervisory training, engineering, optical craftsmanship, welding, farm work, and forging.

The first subjects to be made available cover occupations approved by the War Manpower Commission as requiring first attention, namely Machine Shop Work (9 films), Shipbuilding Skills (10 films), Aircraft Work (6 films), and Farm Work (4 films).

Until recently, the films were sold for the cost of film stock. Now, at the request of Congress, they are being sold at a rate expected to return to the Federal Government the full cost of production. Congress first appropriated \$1,000,000 to the U. S. Office of Education for war training films. For this fiscal year, Congress increased the appropriation to \$2,000,000.

These war training films are not Hollywood productions. They have been made locally by 23 different film producers in 8 States.

At the premier demonstration of the films in Washington recently, Administrator Paul V. McNutt of the Federal Security Agency, declared:

"Every film is outlined by a technical expert and a visual-aids expert. Production is supervised by a committee named by the director of vocational education for the State where the picture is made. This committee usually includes industrial experts, shop teachers and union workers, and, since it is a local group, its advice and guidance is readily accessible to safeguard the accuracy and effectiveness of the training film. To many industries and vocational schools, the Federal Government owes a debt of gratitude for generous help in creating the films.

"America's new training weapon is also being released to our Allies. Canada and South Africa have each purchased over 1,000 prints. Twenty films were recently flown to Soviet Russia. Audiences for these war training films are already estimated to exceed 15,000,000."

The Office of Education points out that this is the first time films have been produced in an integrated series, graduated in difficulty, and intended to form basic curricular material designed to fit into organized courses of instruction. It is also the first time in history of the film industry that filmstrips have been developed deliberately geared into and coordinated with the sound motion picture for the most effective teaching utilization.

## OWI 16mm Fighting Films Conference Held in Washington

NATIONAL civic organization leaders and regional war film coordinators and distributors were invited to join the national OWI 16mm Advisory and Policy Committee and government officials in a two-day conference in Washington January 19 and 20 to discuss additional ways of mobilizing local groups for film showings.

Four resolutions aimed "to accelerate the civilian war effort through the use of 16mm (non-theatrical) motion pictures" were adopted following the conferences and various committee meetings. L. C. Larson, Chairman of the Advisory and Policy Committee announced these resolutions as follows:

(1) The Secretary of War and other leaders of our armed forces have pleaded for bringing the total civilian war effort up to the effectiveness of the armed forces, now poised for an "all-out" attack upon Germany and Japan. Many government agencies are providing the leadership in alleviating the problems caused or intensified by the impact of the war upon the local communities, such as absenteeism, inflation, juvenile delinquency, conservation of health and materials, and food production, distribution and consumption. Many of these agencies have, in addition to the press and radio, relied upon 16mm factual films to vivify the civilian war problems and suggestions for their solution or amelioration.

We therefore recommend that Federal agencies allocate funds to produce additional information films and to provide sufficient prints for their effective and speedy presentation before the adult American public.

(2) The Non-Theatrical Division of the Bureau of Motion Picture of the Office of War Information has harnessed the facilities of the distributors of war films to aid the American war effort. The OWI effectively and speedily circulates 16mm government films to the adult—and to the young adults—of all communities through 241 regional film libraries that serve the 25,000 non-theatrical sound film projectors in the country.

We therefore recommend that the government agencies desiring to reach the industrial and labor organizations, churches, schools and colleges, men's and women's organizations, and other groups owning these projectors, utilize the OWI central 16mm war film distribution system to achieve the speediest presentation of their war films.

(3) There is a great demand by the general public for more films depicting our own armed forces in action. It is recognized by leaders of our armed forces as well as by civilians that the inter-dependence between the armed forces and civilian production compels the development of civilian morale to as high degree as possible. Excellent combat, orientation and industrial incentive films have already been produced by branches of the U. S. Army and Navy for their specialized purposes. But thus far those powerful morale-building films of our armed forces are not yet available to the majority of civilian groups.

To fulfill the needs of the civilian population to achieve its maximum war effort which will help end the war sooner, we recommend that the U. S. War and Navy

Departments, as well as other government agencies, make full use of the national war film distribution system of the Non-Theatrical Division of the Bureau of Motion Pictures of the Office of War Information.

(4) Because the 16mm film medium reaches the American public at a point which expedites immediate action, we strongly urge that the Treasury Department use non-theatrical prints to complement its commercial theatre (35mm) program. The 16mm films can best be employed "at the point of sale" during pay-roll deduction war bond drives and other war finance campaigns.

We therefore recommend that:

(a) The Treasury Department produce films dealing with inflation and financing the war, and provide sufficient prints for national distribution through 16mm war film distributors as well as through commercial theatres.

(b) The Treasury Department provide 16mm prints of dynamic films that will induce attitudes favorable to investing earnings in war bonds; and that the Department's messages during its periodic war bond campaigns also be issued in 16mm trailers that can be attached to these morale-building films for special presentation at the actual fund raising drives in the local community group meetings.

At the first day's session, presided over by Mr. C. R. Reagan, head of the Non-Theatrical Division of the OWI Bureau of Motion Pictures, reports on film services and facilities of War Film Agencies were made by the following representatives: Joe Weil, Red Cross; J. R. Williams, British Information Service; R. C. Maroney and Oscar Sams, CIAA; Wesley Greene, National Film Board of Canada; Lt. Douglas George, U. S. Navy; R. W. Coyne, U. S. Treasury; George J. Janeczek, United Nations Information Center; C. A. Lindstrom, U. S. Department of Agriculture, and Lient. R. W. White and Major John W. Hubbell, U. S. Army.

On the second day addresses were given by George H. Healy, Director OWI Domestic Branch, and Stanton Griffis, Chief of the Motion Picture Bureau. At the luncheon meeting Col. Kirk B. Lawton, chief of the Army Pictorial Service, told the group that although the volume of training films being turned out by the Army Pictorial Service is falling off sharply, the same organization will be kept fully occupied in production of an extensive series of educational films for the Army.

Elementary subjects will be covered mostly. There will be several series devoted to instruction in foreign languages, literature, the arts, music, etc.

This program is getting under way at once, and it is expected that several productions will be completed before long and stored away pending the armistice. It is not unlikely that troops in isolated posts where there is little action—Iceland, Greenland, Alaska, for instance—will be sent some of these prior to the armistice.

Various Sub-Committees of the National 16mm Advisory and Policy Committee also met during the Conference, such as the Committee on State and Local War Film Utilization, the Committee on War Incentive Films, the Committee on Service Charges and Attendance, and the Committee on Assistance to U. S. Treasury Department.

### **Eighteenth Century Life in Williamsburg, Virginia**

(Eastman Kodak Company, Informational Films Division, Rochester 4, New York) 44 minutes, 16 mm. sound, Kodachrome, price complete, \$240; Unit I (Reels 1 and 2), \$120; Units II and III, \$60 each. Produced by Eastman Kodak Company in cooperation with Eighteenth Century Williamsburg, Inc. Apply to distributor for free rental.

Through the medium of color-photography a day in the lives of a few Williamsburg colonists is re-created. As the lamp-lighter at sun-up extinguishes one of the village lamps, the slaves belonging to the Christopher Kendall household perform their daily morning tasks. Dina, the kitchen slave, and her two children—Polly and Cutty—through practiced division of labor, produce a most appetizing breakfast. This town house, as others in Williamsburg, was practically self-supporting. Polly gathers the eggs, Cutty fetches the bacon from the smoke house and the butter from the dairy house. He draws water, carries in wood, takes embers in a pan to the master's bedroom, there starts a fire in the fireplace, and pours hot water. The master emerges from his curtained bed, enjoys the warmth of the open fire, washes himself with home-made soap, shaves with a razor imported from England, and cleans his teeth with a frayed sassafras root. While he clothes himself and adjusts his wig, preparations for breakfast proceed in the kitchen which is separate from the house. Coffee is roasted in the fireplace and ground with a manually operated mill. All cooking is done in the fireplace. When the family assemble in the dining room, they are served the products of Dina's culinary arts—bacon, eggs, porridge, coffee, waffles, and toast. Thus ends the first part which deals with family life.

The second part dealing with cabinet-making takes place in the shop of Christopher Kendall, whose son, Tom, is beginning his apprenticeship under the instruction of the journeymen. Apprentices usually served an apprenticeship for seven years during which time they were fed, clothed, and housed at the master's expense. Journeymen were those cabinet-makers who had completed their apprenticeship but had not yet assumed control of a shop. Upon this particular day the royal governor of Virginia and his lady visit the shop to inspect a desk which was being made for them. Kendall and all his helpers are pleased by their customers' satisfaction. In privacy Kendall shows the governor a secret drawer where he might cache valuable papers

This monthly page of reviews is conducted for the benefit of educational film producers and users alike. The comments and criticisms of both are cordially invited.

Producers wishing to have new films reviewed on this page should write L. C. Larson, Indiana University, Bloomington, Indiana, giving details as to length, content, date on which the film was issued, basis of availability, prices, producer and distributor. They will be informed of the first open date when the Teacher Committee will review the films. The only cost to producers for the service is the cost of transporting the prints to and from Bloomington. *This Cost Must Be Borne By The Producers.*

Assisted by CAROLYN GUSS  
and VIOLET COTTINGHAM  
Extension Division  
Indiana University, Bloomington

or possessions. This part of the film ends as five men and an oxen-drawn cart deliver the desk to the governor's mansion.

The film concludes with scenes of community life in which are shown the blacksmith's shop, the Raleigh Tavern, the post-rider, the jail, and the evening activities in the Kendall home. In each of these centers of community life the simple unrehearsed activities of the colonists are portrayed and one has the feeling that the film has been produced so "that the future may learn from the past."

**Committee Appraisal:** This film is an outstanding example of the creative use of the potentialities of cinematography in Kodachrome and the facilities of a cultural shrine to present a vivid and accurate account of the everyday life of Americans who lived and worked two centuries ago. It will be of particular interest to either the specialists interested in ways and means of the diffusion of knowledge or the teacher charged with the responsibility of providing students or adults with an understanding of American life during the Colonial Period.

### **ABCA**

(British Information Services, 30 Rockefeller Plaza, New York 20, New York) 16 minutes, 16mm. sound, \$12. Produced by the Army Film Unit for the Ministry of Information. Apply to distributor for free rental or rental sources.

The film begins with the statement made by Oliver Cromwell three hundred years ago, "The citizen soldier must know what he is fighting for and love what he knows." Based upon this theory, the British in 1941 set up ABCA—the Army Bureau of Current Affairs—to equip each British soldier with a weapon of the mind built upon a knowledge of current events and a confidence in his military science against which enemy propaganda would be valueless.

Scenes of fighting in this war are shown as the commentator explains that while the British are tough physically, they must be provided with a mental ammunition. The need for such training is apparent as there are shown scenes of men in barracks discussing the fall of Dunkirk, Britain's weaknesses, and Germany's secret weapons. The mental ammunition must be impervious to rumor as well as to propaganda. The Adjutant General discusses the new bureau and emphasizes that its function would be to inform rather than to propagandize.

Skepticism and derision are the reactions of the men as they meet for the first time with their leaders. To illustrate the purpose of ABCA, the leader poses the question of Britain's being at Tobruk. To the leader's extreme satisfaction, the men responded eagerly and spontaneously. A further explanation brings out the fact that the discussion will treat two topics; war and its active operation and current events dealing with immediate and long time problems.

Short scenes show various groups actively discussing the topic of the week. The men contribute shyly at first, then eagerly. The men discuss their enemy as a nation and as individual opponents. Leaders attend sessions and are taught how to lead group discussions. Two types of

**POST PICTURES CORP.**  
723 Seventh Ave., Dept. 10, New York 19, N. Y.

leaders are shown and warned against: the one who does all the talking and the one who takes no part and permits the discussions to develop into pointless argument.

Since the initial experiment proved a success, ABCA has gone beyond the current affairs stage. Other media of communication are brought into use—wall maps, pictures, pamphlets, radio broadcasts, and records of personal experiences. To show the general interest in ABCA, a type of "Information, Please" program is conducted between American and British officers with the enlisted men as the audience.

The film ends with close-ups of soldiers as the commentator reiterates that ABCA stresses the importance of making each soldier an individual fighting unit to strengthen his defense against the enemy, to initiate a counter offensive, and to make a positive contribution toward peace.

**Committee Appraisal:** An illuminating overview of a plan under which free discussion of current problems have become part of the training of every British soldier. The major portion of the film deals with techniques of group discussion and the role of the discussion leader. Highly recommended for professional courses in teacher-training institutions, staff meetings of secondary and college faculties and groups interested in either civilian or military programs of general adult education.

**The Main Dish**

(National Film Board of Canada, 84 East Randolph, Chicago) 18 minutes, 16mm. sound, black and white, \$30. Produced by National Film Board of Canada, Ottawa, Ontario, Canada. Apply to distributor for rental sources.

The film opens with a series of shots showing Canada's vast cattle herds while the commentator explains that half of their meat production must go directly or indirectly to serve the needs of war.

The action then shifts to a butcher's shop with the butcher giving a practical demonstration in cutting up and quartering meat. By means of a diagram, such cuts are shown as corner rump roast, flank steak, lean plate beef, beef brisket, front shank, rolled neck pot roast, and blade pot roast.

After a home economist's demonstration of cooking by moist heat, there follows a survey of cooking implements—casseroles, pans, oven, roaster. Housewives are advised to choose menus that can be cooked while they are absent. The commentator adds: "Plan to use those vegetables which can be slipped into the oven when you return. Make a pudding to cook slowly in the oven with the meat. In this way, the best use is made of both food and fuel. Put your soup in the oven too. . . . it can be simmering while you are away."

Then follows an exposé of fuel-saving combinations: vegetables cooked around meat, potatoes added, soup simmering without extra cost. Casserole dishes are advocated as nourishing and fuel-saving.

Grill cooking methods are then demonstrated. The film ends as the commentator states, while a housewife is seen putting a roast on the platter, "Whatever the cut or the method of cooking, the most successful meal is planned around the protein dish."

**Committee Appraisal:** A timely film on the selection and preparation of meats. Typical kitchen scenes rather than laboratory demonstrations contribute to the reality of the presentation. Recommended for use by classes in home economics and any adult groups interested in planning meals.

**Help Wanted**

fore the doctor arrives. Techniques of first aid are shown in a first-aid station.

Opening scenes show a victim of an accident being wheeled into an operating room; a news reporter is questioning the doctor about the accident. The doctor emphasizes the value of a working knowledge of first aid and proceeds to give instructions in fundamental applications.

There follow scenes of typical accidents that may cause bleeding wounds; a chart of the circulatory system of the human body; types of bleeding; digital pressure points for bleeding of scalp, face, neck, shoulder, and leg; types and uses of tourniquets; cause and treatment of shock, including proper position of body and administering stimulants. The difference between arterial and venous bleeding and their control are illustrated by analogies of flow of water from a pump and a faucet. Animated diagrams superimposed over actual photographs are used to show blood circulation, pressure points, and treatment of bleeding.

The film depicts uses of compresses and triangular and roller bandages, treatment of burns, some accidents that may cause unconsciousness, demonstration of procedures in artificial respiration, simple and compound fractures and their treatment, use of splints, and methods of transporting injured.

**Committee Appraisal:** This first aid film, reviewed and passed by U. S. Office of Civilian Defense and American College of Surgeons, presents the general procedure to be followed in caring for accident victims before the arrival of the doctor. Excellent use is made of close-up photography which enables large groups to observe the techniques of first aid. In spite of the fact that other practices are accepted by various groups, the techniques presented in this film should not be confusing. The film will be useful in teaching first aid to student and adult groups.

## OWI 16mm Fighting Films Conference

(Concluded from page 85)

The National 16mm Advisory and Policy Committee is composed of leaders of eight national organizations concerned with the distribution and use of non-theatrical films in the United States. Those who participated in the Washington conferences were: Educational Film Library Association, L. C. Larson, Chairman of the Board, Indiana University, Bloomington; American Library Association, Audio-Visual Aids Committee, Miss Mary U. Rothrock chairman, Knoxville, Tennessee, and Miss Batchelder, secretary, Chicago; National Education Association, Department of Visual Instruction, Mrs. Camilla Best, president, New Orleans; National University Extension Association, J. R. Rorer, University of Virginia, Charlottesville; Allied Non-Theatrical Film Association, W. K. Hedwig, president, New York City; National Association of Visual Education Dealers, Merriman Holtz, vice-president, Portland, Oregon. The other members of the national committee are: National War Committee for the Visual Education Industry, Bertram Willoughby, Chicago; and Visual Equipment Manufacturers Association, O. H. Coelln, Jr., Editor BUSINESS SCREEN, Chicago.

The National 16mm Advisory and Policy Committee appointed as its secretary, Milton M. Enzer, deputy director of the New York State War Council's Office of War Training, Albany, New York.

## Visual Teaching of Spanish

A significant demonstration of the use of sound film for the teaching of foreign language was given in the Education Session of the Thirtieth National Foreign Trade Convention, held last October in New York City. The 16mm film presented was the experimental first film, in a proposed series of 40 Instructo-Films on Spanish, and was made by Professor Louis G. Bayo, Director of Audivision Language Teaching Service, 74 Trinity Place, New York. It embodies in audio-visual form, the mass-teaching method and material developed by Professor Bayo during his 25 years of teaching in the Downtown School of Spanish in that city.

The audience of businessmen, inter-Americanists and educators went to school again for 15 minutes and showed their enthusiasm by lively discussion afterward. The point was raised that phonograph records could achieve the same end more cheaply, but this was refuted by some who had tried the discs and lost interest very soon. The sound motion-picture, showing the facial and oral movements of the speaker and allowing ample time for oral repetition by the audience, was far more stimulating, interest-holding and effective. The consensus seemed to be that the full series of 40 films, made with modifications and improvements as determined by study of the experimental first film, should have great value and nationwide use not only in Schools and Colleges but also in the Army, Navy and Air Forces, in Associations and Clubs, and in Office, Plant and Factory. Such a series should be a potent factor in the expansion of language-study certain to come in the post-war period.

The experimental film has been seen, and approved in principle, by Mr. Nelson A. Rockefeller, Dr. L. S. Rowe (Director General of the Pan American Union) and their respective assistants, and the project has been sponsored by the Education Committee of the National Foreign Trade Council. The Office of the Coordinator of Inter-American Affairs has invited the press to let the people know about this pioneering work in order to determine the extent to which these films are needed. The Audivision Language Teaching Service invites correspondence.

## Critics Vote Ten Best Films of 1943

*Random Harvest*, Metro-Goldwyn-Mayer's picturization of James Hilton's novel, starring Greer Garson and Ronald Colman and directed by Mervyn LeRoy, was acclaimed the best film of 1943 by the 439 critics and reviewers of the press and radio who participated in the annual poll conducted by the *Film Daily*.

The other nine of the "Ten Best" poll were, in order of votes received: *For Whom the Bell Tolls* (Paramount), *Yankee Doodle Dandy* (Warners), *This Is The Army* (Warners), *Casablanca* (Warners), *The Human Comedy* (MGM), *Watch on the Rhine* (Warners), *In Which We Serve* (Coward-U.A.), *So Proudly We Hail* (Paramount), and *Stage Door Canteen* (Lesser-U.A.)

## Government Visual Aids on Aviation for Schools

Through the courtesy of the U. S. Army Air Forces, over 50 visual aids dealing with aerial navigation, aerodynamics, aircraft identification, aircraft engines and structures, and other subjects are now available to schools carrying on preflight training programs. There are 26 motion pictures and 28 filmstrips, ranging in content from celestial navigation to the use of parachutes.

Navy aviation training films and filmstrips produced by the Training Film Unit of the Bureau of Aeronautics of the Navy Department are also available. The Navy films deal with aerial navigation, aircraft structures, instruments, and engines, airplane production, aircraft maintenance and repair, and flight instruction. Titles range from "Nautical Astronomy" to "Adjusting Hydraulic Brakes," from "Aerology" to "Anchoring and Mooring Seaplanes."

Together the Army and Navy have released to schools more than 100 visual aids on aviation, through the U. S. Office of Education. All the motion pictures are 16mm sound films, all the filmstrips are 35mm silent.

These visual aids may be purchased from the contract distributor of all Office of Education visual aids, Castle Films, Inc., 30 Rockefeller Plaza, New York. Schools and other non-profit-making institutions are entitled to a 10 percent discount and an exemption from the Federal excise tax on film. In order to receive these price reductions, however, schools must present a tax exemption certificate.

Schools interested in renting any of these films or filmstrips should go to their usual source of 16mm educational films, or write to the Division of Visual Aids for War Training, U. S. Office of Education, Washington 25, D. C., for a copy of *Bibliography of Visual Aids for Pre-Induction Training*.

## Spring Quarter Visual Courses

Ball State Teachers College, Muncie, Indiana, will offer a four-hour course in Audio-Visual Education (Education 451) both in the spring quarter, March 13-June 2, and summer term. Miss Evelyn Hoke, Director, Teaching Materials Service, will conduct the course.

Dr. Walter A. Eggerth will give a course in Visual Instruction twice weekly during the spring quarter at DePaul University, Chicago, Illinois, commencing March 13th.

## Army Film Shows at Home and Abroad

A world survey of the Army Pictorial Service's 19 overseas exchanges, serving all theatres of operations, revealed, according to Major John J. Hubbell, that on an average night 630,000 soldiers attend 1,269 film showings.

Domestically the current attendance rate yearly is 240,000,000 at motion picture theatres run by the Army Motion Picture Service at camps in the

## Goldf New "FILMATIC" Triple-Purpose Film Slide Projector

**FORCED AIR COOLED**

**USED 3 WAYS**

1. For 2 x 2 Slides
2. For Single Frame 35mm Slide-film
3. For Double Frame 35mm Slide-film

**Used By the Armed Forces**  
★ **SPEEDS VISUAL TRAINING**

- ### Advanced Features
- New Non-Rewind Design Eliminates Rewinding
  - Motor Driven Forced Air Cooled
  - Feed Capacity up to 300 Single Frame Pictures
  - Instantly Adjustable
  - Includes Manumatic Slide Carrier
  - . . . and other features

This new easier-to-operate projector simplifies your projection problem in war training and industrial education, Provides clearer visibility for larger audiences. The Filmatic is built like a professional model—yet is easily portable. Has corrected projection lens (5" f 3.5). Uses 300, 200 or 100 watt lamp. Complete with switch, cord and custom-built carrying case.

## Goldf New AIR-FLO STEREOPTON

- Forced-Air Cooled
- Takes up to 1000 Watt Lamps
- Choice of Lenses
- Pre-Focus Socket Aligns Filament on Optical Axis
- All-Steel-Welded Structure
- Built-in Tilting Device
- Fully Adjustable Bellows

**Above Items Are Available Now on Proper Priority for:**  
Educational Institutions—Army and Navy—Maritime bases—Lend-Lease—War Industries—Government Agencies—Medical Profession, etc.

Developed to meet today's needs in training centers and schools. Cooler-operating . . . for long projection distances. Shows standard 3 1/4" x 4" stereopticon slides. Has powerful but quiet high speed motor. Three ground and polished lens furnished. 30" long overall. Stands firmly . . . yet is conveniently portable.

When writing, please address DEPT. C

# Current Film News

■ **BRANDON FILMS, INC.**, 1600 Broadway, New York 19, is proud to be able to announce the release in 16mm sound film of the following two remarkable film documents on our allies, the people of China and of the Netherlands:

**Inside Fighting China**—18 min. running time—produced by the National Film Board of Canada and released to theatres in the U. S. by United Artists. This film is a compact, clear action picture of Sino-Japanese relations from September, 1931 until sometime after Pearl Harbor, showing how China overcomes her handicaps and problems in the war. It offers a true pictorial record of a fighting nation, seeking a new future even while engaged in a life-and-death struggle with a ruthless invader.

**The Dutch Tradition**—a 3-reel documentary film on contemporary Dutch history, made by John Ferno in cooperation with the Netherlands Information Bureau. It is an informational picture presenting the story of the Netherlands during the last four years, up to the brutal German invasion of Holland and the Japanese capture of the East Indies. The film represents a geographical, ethnological, historical and political lesson on the Netherlands, pointing out the geographical aspects of Holland, and the rich natural resources of the Netherlands East and West Indies, of such strategic importance in the current world struggle. Also described is the Dutch contribution to our common fight against the Axis.

■ **BRITISH INFORMATION SERVICES**, 30 Rockefeller Plaza, New York 20, report the availability of many new subjects for rental or purchase, among them:

**The Great Harvest**—a tribute to the farmers of Great Britain who went into action the day war was declared. Over-night, food had become a weapon of war, and the farmers, with aid and advice from the Ministry of Agriculture, set to work to reclaim every possible acre. When harvest time came, volunteers from the towns gave their holidays and week-ends, school children camped in the fields and

worked, and men and women from the armed forces gave their services.

**South Africa**—the first of a series entitled "Know your Commonwealth," made by Crown Film Unit. This film opens with a brief outline of the coun-

try, showing how it is a land of contrasts in farming, living, worshiping, trading and in transport, and tells how South Africa made her own decision to enter the war, and how she backed that decision. With the help of the British Admiralty, a navy was built up to defend the coastline, and RAF experts aided in South Africa's Air Training Scheme.

**Psychiatry in Action**—made at the Millhead Emergency Hospital under the supervision of Dr. Walter Maclay to illustrate the wartime application of psychiatry to neuroses both in servicemen and civilians.

**British Film Magazines**—a new series of very short subjects assembled mainly for showing to war workers in factories who do not often have time to go to the movie theatres. The subjects are of special interest to those people as they show them what a close link there is between the workers on the home front and those in the Armed Forces.

■ **BELL & HOWELL COMPANY**, 1801 Larchmont Ave., Chicago, have obtained several feature productions for their Filmosound Library, including:

**Men of Texas** (Universal)—9 reels—depicting the "Lone Star" State just after the Civil War. The courage and heart of immortal Sam Houston dominates this epic story of the conflict between those who supported their country and those who, under the guise of "State Rights", followed their own lawless interests. The cast includes Robert Stack, Brod Crawford and Jackie Cooper.

**Pardon My Sarong** (Universal)—10 reels of Abbott and Costello antics. Marooned on a South Sea Island, they cram hilarious fun, romance and adventure into a prize example of pure escapism.

■ **WALTER O. GUTLOHN, INC.**, 25 West 45th Street, New York, has just added the following major features to its releases available for rental on an advance approval basis:

**Eagle Squadron**—with Robert Stack and Diana Barrymore. An exciting drama built around America's first flying fighters in action—the story of the Spitfires, the Commandos, the W.A.A.F.'s and the Channel Fleet.

**The Magnificent Ambersons**—Booth Tarkington's prize-winning novel directed by Orson Welles, with Joseph Cotton and Dolores Costello. A love-story motivated by pride, jealousy, revenge and life-long devotion, against the background of a midwest city at the period when the automobile came into its own and brought great changes in the economic and social life of America.

Also currently being released by Gutlohn are three new *Soundies*:

**Hail, the U. S. Marines**—featuring the newest U. S. Marine song, inter-

persed with thrilling action close-ups of the invasion of the Jap-held island of Tarawa.

**Don't Be an Absentee**—the singing of the song of this title backgrounds actual scenes from the invasion of Sicily and "Desert Victory". The sub-

ject has received the approval of Donald Nelson, WPB chief, and of Secretary of the Navy Knox.

**Don't Change your Job**—shows how the American home front is doing its part from steel mill to shipyard, backgrounding a song that is dedicated to keeping our men and women on their jobs.

(Concluded from page 91)

United States, Alaska, Bermuda and Newfoundland, according to estimates of the War Department. The Army Service is now operating 1,162 houses with a capacity of 786,000, and is adding 56 theatres to the total seating capacity to 817,000.

**Scholastic Bookshop Distributor of Visual Learning Guides**

Scholastic Bookshop, a division of the Scholastic Corporation, publishers of Scholastic Magazine, has become exclusive national distributor and sales representative for National Audio-Visual Council Visual Learning Guides.

The National Audio-Visual Council, Inc., 160 North LaSalle Street, Chicago, Ill., will continue to edit and publish the Visual Learning Guides but all sales and shipments will be handled by Scholastic Magazines, 220 East 42 Street, New York 17, N. Y.

National Audio-Visual Council Visual Learning Guides are designed for use with U.S. Office of Education, the Army, the Navy and specially recommended Erpi classroom films. Guides are now available for 84 different films and a series of new titles are in preparation and will be announced shortly.

**Recordings of Wartime Significance**

Two catalog revisions have been prepared by the Educational Script and Transcription Exchange. *Transcriptions for Victory* contains approximately 240 educational programs dealing with topics of immediate wartime significance. All listings are annotated to indicate the nature of each program and the grade-level and teaching applications for which they seem best suited.

The new *Scripts for Victory Catalog* includes approximately 50 recently acquired scripts. More than half of them have been broadcast over national networks. Eight are from the *Cavalcade of America* series and deal with current naval history. A series of five *Victory Corps in Action* scripts was written for Victory Corps units and tells in dramatic form what boys and girls of our secondary schools are doing to win the war.

Copies of each of these catalogs are available on request to the Educational Script and Transcription Exchange, U. S. Office of Education.

A group of seven recordings on China have been made available to the Transcription Exchange through the Courtesy of The East and West Association of New York City. There are no charges for loan or for shipment either from or to Washington. These 16-inch (33 1/3 r.p.m.) recordings, made by Pearl Buck, Lin Mousheng, and other well known writers and interpreters of China, offer senior high school and college students a better understanding of the life and culture of the Chinese people.

Write for Complete Catalog

■ PICTORIAL FILMS, INC., RKO Building, Radio City, N. Y., announces the acquisition of the 16mm distribution rights to a series of films produced by Pathe News and released through RKO Pictures, Inc., entitled:

**This Is America**—a monthly release which has been playing in 6000 theatres throughout the country. 16mm prints are available for lease and rental from Pictorial Films, Inc., now for the first time. Beginning in February the first in the series will be available, and thereafter one each month, as follows:

February, *Army Chaplain*; March, *Boontown, D. C.*; April, *Air Crew*; May, *Medicine on Guard*; June, *Merchant Seamen*; July, *Lieutenant Smith*; August, *Pacific Island No. 43*; September, *Broadway Dim-Out, Arctic Passage*; October, *Age of Flight; Children of Mars*. These films will be made available to schools, organizations and institutions on long term lease for permanent film libraries, or on a spot booking basis. Special discounts are allowed to schools on leases and all prints come reeled and boxed in metal containers. For complete details and descriptive folders, write to Pictorial Films, Inc., Radio City, N. Y.

■ POST PICTURES CORPORATION, 723 Seventh Ave., New York 19, has just released on 16mm sound the gay musical comedy:

**Road Show**—portraying the hectic excitement of life with a traveling carnival show. Featured is a galaxy of screen and radio stars, including Adolphe Menjou, Carole Landis, Charles Butterworth and The Charlotiers.

The sixth edition of the Post Pictures catalogue is available on request by writing to the company.

■ THE PRINCETON FILM CENTER, Princeton, New Jersey, has started production on a two-reel film for the Coordinator of Inter-American Affairs, bearing the title:

**University Town**, which will present the wartime activities of an American college community for Latin American consumption.

Scenes are being photographed on the campus of Princeton University, at the Institute for Advanced Study, in the research laboratories of the Radio Corporation of America, and of the famed singers of the Westminster Choir College. Professor Albert Einstein of the Institute for Advanced Study has broken a long-established precedent against motion picture appearances by appearing in this film.

The picture is being produced under the supervision of Gordon Knox, Film Center head.

Consolidated-Vultee Aircraft Corporation has just concluded arrangements with The Princeton Film Center to distribute prints of *PBY Record Breakers* and *Cradle of Victory*. Both subjects are 16mm sound and deal with aircraft produced by the makers of the famous Liberator bomber.

## Among the Producers

### Walt Whitman on Victor Records

Whitman's poetry is being made available for the first time on phonograph records with RCA-Victor's release in February of an album of selections from "Leaves of Grass". The dramatic reading is by Ralph Bellamy, film and stage star.

Speaking of war, of freedom and of the essential spirit of America, the poems included in the album are as timely as if they had been penned but yesterday. Included in the album besides an appropriate introduction are: To a Certain Civilian; I Think I Could Turn and Live with Animals; To the Man-of-War Bird; For You, O Democracy; Vigil Strange I Kept on the Field One Night; Long, Too Long, America; Over the Carnage Rose a Prophetic Voice; O Star of France; To a Foiled European Revolutionary; Europe; France; A Broadway Pageant; Years of the Modern; I was Looking a Long While; Passage to India; By Blue Ontario's Shore; So Long!; and Song of the Open Road.

### Leica Projectors for Civilians

Through a recent order of the War Production Board, it is now possible for many civilian consumers to purchase Leica VIII-S Projectors. E. Leitz, Inc., makers of Leica products, report that their present supply of VIII-S Projectors is sufficient to meet the requirements of the Armed Forces and government agencies and still leave a quantity of projectors for purchase by civilians. VIII-S 300-watt Projectors complete with slide changers and projection lenses can be supplied.

Complete details on how to obtain the projector can be had from E. Leitz, Inc., 730 Fifth Avenue, New York, 19, New York.

### New Kodachromes from "The Cavalcade of South America"

A set of thirty-five 2" x 2" Kodachrome slides from the collection of Charles Perry Weimer's *The Cavalcade of South America* has been added to the library of the Society For Visual Education, Inc., 100 East Ohio Street, Chicago 11, Illinois.

Mr. Weimer made a 100,000 mile, eighteen-month photographic survey of the continent of South America. Slides representative of Brazil, Chile, Venezuela, Colombia, Ecuador, Argentina and Peru are included in the set offered by S. V. E.

Especially beautiful in color and composition are two scenes, both photographed in Chile—one pictures the peaceful little port at Amargos; the other depicts vividly the breathtaking grandeur of the Andean Pass at Laguna del Inca.

Other slides in this set give authentic glimpses into the life, customs and architecture of our neighboring South American countries. A complete list will be furnished free upon request.

### A New Bell & Howell Product

Bell & Howell Company, Chicago, has added another product to its long list of precision-made equipment, a double-duty Filmo Porta-Stand which looks like a suitcase when closed and is easily carried by means of its leather handle. Opened, it is a stand 42" high, with a platform 12½" x 24½" which accommodates any size projector—8mm or 16mm, and boasts a convenient shelf for holding reels and cans during a show. The Porta-Stand puts an end to book stacking on chair or table for proper projection height.

Constructed of rigid basswood-plywood finished in lustrous brown lacquer, with durable steel hardware used throughout, the Porta-Stand utilizes non-critical materials and is available without a priority.

Two views of the Porta-Stand

# Additional Valuable Literature —

## "1000 AND ONE"—The Blue Book of Films

"1000 and ONE" The Blue Book of Non-Theatrical Films, published annually is famous in the field of visual instruction as the standard film reference, indispensable to film users in the educational field. The **CURRENT, NINETEENTH EDITION** lists and describes **over 5,000 films**, classified into 176 different subject groups (including large groups of entertainment subjects). A valuable feature is a complete alphabetical list of every film title in the directory. Other information includes designation of whether a film is available in 16mm, or 35mm, silent or sound, number of reels and sources distributing the films, with range of prices charged. 136 pp. Paper. Price 75c. (25c to E. S. Subscribers)

## FILM EVALUATION SUPPLEMENTS TO "1000 and ONE" under The National Film Evaluation Project

A new and unique service to the teaching field. Film Evaluations made by nation-wide Judging Committee of over 500 teachers after actual use of the films with classes.

Each Supplement consists of 50 standard-size library cards carrying detailed evaluations of 50 films, based on combined scores of 15 or more teachers on each film. Three Supplements have appeared to date. Another appears as soon as 50 more films attain their quota of 15 or more scores.

Price per Supplement—50 cards in carton, serially numbered 1 to 50, 51 to 100, 101 to 150, etc., with full explanations accompanying, 50 cents (postpaid if cash with order.)

## VISUALIZING THE CURRICULUM

By C. F. Hoban, C. F. Hoban, Jr., and S. B. Zisman.

Presents in theory and in practice the basic methodology of visual instruction in relation to classroom procedure. Provides an abundance of technical guidance in the form of illustrative drawings of photographs, reports of school journeys, suggestions for mounting materials, for making slides, film strips, etc. It incorporates up-to-date material, provides a fine balance in the treatment of various teaching aids, evaluates various types of aids, and defines the functions and values of each in the learning process.

320 pp. Cloth. Illus. Price \$2.75. (20% discount to schools)

## THE AUDIO-VISUAL HANDBOOK (4th Edition)

By Ellsworth C. Dent

Presents in convenient form, practical information\* for those interested in applying visual and audio-visual aids to instruction. The six chapters include discussions on "The Status of Visual Instruction," "Types of Visual Aids and Their Use," "Types of Audio-Visual Aids to Instruction," "Types of Sound Aids for Schools," "Organizing the Audio-Visual Service," "Source List of Materials and Equipment."

212 pp. Illus. Cloth. Price \$1.75

## AUDIO-VISUAL AIDS TO INSTRUCTION

By Harry C McKown and Alvin B. Roberts

A practical volume which shows the teacher and administrator how to select, organize, and utilize audio-visual aids of all types, in all subjects, and at all levels, from kindergarten through the twelfth grade. Primary emphasis is on actual practice and every effort has been made to include specific information and advice which will be most helpful in the classroom.

384pp. Cloth. Illus. Price \$3.00

## PICTURE VALUES IN EDUCATION

By Joseph J. Weber, Ph. D.

Presents in unusually interesting form the results of the extended investigations on the teaching values of the lantern slide and stereograph. 156 pp. Cloth. Illus. Price \$1.00 (67c to E. S. subscribers)

## AN ALTERNATIVE FOR REVOLUTION AND WAR

By Albert E. Osborne.

A stimulating, wide-range view of the higher potentialities of visual instruction in promoting world harmony by a "more humanity-centered education." A pertinent reply to H. G. Wells's dictum that the "future is a race between education and catastrophe." 124 pp. Cloth. Price \$1.25.

## EVALUATION OF STILL PICTURES FOR INSTRUCTIONAL USE.

By Lelia Trolinger

A full presentation of the latest piece of research on determination of teaching values of pictures. Development of the Score Card and elaborate experiment in use of same. Full documentation, tabulation of results, and appendices. The latest, most complete and scholarly investigation of a problem in the visual teaching field that has long needed such a solution. 48 pp. Paper. Illus. Price 50c.

## PRODUCING SCHOOL MOVIES

By Eleanor Child and Hardy R. Finch

Based on first-hand experiences of the authors and those of many other teachers and movie enthusiasts. Chapters are "Organization (of a Club); Choosing the Idea; The Scenario; Buying Equipment; Using the Equipment; Filming the Picture; Advanced Techniques; Final Preparation and Showing. A welcome book to those who want movie-making explained in simple terms. 151 pp. Paper. Illus. Price \$1.50.

## SELECTED FILMS FOR AMERICAN HISTORY AND PROBLEMS.

By William H. Hartley

Part I gives directions for obtaining, evaluating and utilizing films. Part II comprises a fully annotated catalog of the most useful films for illustrating various aspects of American Civilization. Title of film, length, whether sound or silent, production date, producer, sale and rental price and grade level suitability, are given. Also synopsis of film content. Suggestions are offered concerning most effective application of the film to the teaching situation.

275 pp. Cloth. Price \$2.25.

## THE USE OF VISUAL AIDS IN TEACHING

By Ella Callista Clark, Ph. D.

Brief, clear, concise, authoritative. An attractively printed manual of procedure for all visual aids in teaching, with stimulating suggestions for the inexperienced teachers as well as for the veteran.

24 pp. Paper. Illus. Price 25c.

## HOW TO MAKE HAND-MADE LANTERN SLIDES

By G. E. Hamilton

24 pp. Paper. Price 10c.

## THE STEREOGRAPH and LANTERN SLIDE IN EDUCATION.

By G. E. Hamilton.

The most comprehensive discussion yet published.

47 pp. Paper. Price 15c.

# Will **OPTI-ONICS** vitalize\* visual instruction?

Yes... in fact, the advances are *already* well under way!

For out of the matchless accuracy of the secret OPTI-ONIC devices we make today, for war, will come truly significant refinements in the Bell & Howell Cameras & Projectors for tomorrow's classrooms.

There will be mechanical refinements... cooler, quieter operation... simplified controls... improved general performance. But more than these, there will be a new *realism* for tomorrow's educational screen... a seeming *absence* of mechanical intervention to bring to your screen even more of motion pictures' educational power and influence.

We don't *imagine* these things. We're *certain* of them... for the way to *achieve* them is *already clear*... through OPTI-ONICS.

Bell & Howell Company, Chicago; New York; Hollywood; Washington, D. C.; London. Established 1907.

\*Webster: To endow with life.

### HELP US PLAN THE FUTURE OF OPTI-ONICS

Engineers with a finished background in electronic or mechanical design can find a great future in helping Bell & Howell explore the peacetime horizons of OPTI-ONICS. Send complete details and photo to: Chairman, OPTI-ONICS Development, 7100 McCormick Road, Chicago 45, Illinois.

**NOW—BUY MORE WAR BONDS**

Products combining the sciences of OPTICS • electrONICS • mechanICS

**FILM SYMPOSIUM ON BIRDS... A FILMOSOUND LIBRARY TEACHING CLASSIC**—The Filmosound Library has long made a specialty of films on nature... wild life... flowers. Among them are literally dozens of beautiful motion picture studies of the world's bird life. Technical difficulties encountered in filming birds in their natural environments have been ingeniously surmounted to bring to your students a series of unequalled *color* films.

Few other study methods can reveal more of the interesting habits and instincts... the intricate markings and colorings of birds. Your classes will welcome... and *remember* the lessons of these fine films.

### THE FILMOSOUND LIBRARY CATALOG

lists these and thousands of other films on many subjects. The *Educational Utilization Digest* helps you select the ones that apply to your subject and the age group you are working with. Send the coupon for your copy of each.

Opti-onics is OPTICS... electrONICS... mechanICS. It is research and engineering by Bell & Howell in these three related sciences to accomplish many things never before obtainable. Today Opti-onics is a WEAPON. Tomorrow, it will be a SERVANT... to work, protect, educate, and entertain.

# Teach **ECONOMIC AND PLACE** Geography

## FASTER-EASIER-MORE THOROUGHLY WITH THE AID OF *Filmsets*

16 mm. Silent Classroom Teaching Films

Vitalize the subject of **ECONOMIC** (shelter-food-clothing) and **PLACE GEOGRAPHY** for Intermediate Elementary school grades with **FILMSETS**—200-ft. silent films. Start your own classroom film library with any or all of these 22 Economic and 26 Regional 16mm. Silent films. Planned and filmed over a period of five years—and at a cost of \$100,000.00—individual **FILMSETS** are priced at the surprisingly low figure of \$12.00 per reel. Buy as many reels as you wish.

**ILLUSTRATED MANUAL IS LESSON OUTLINE** Without dictating how lessons are to be taught, **FILMSETS TEACHER'S HANDBOOK** contains accurate general information on each film—arranged to provide adequate discussion material.

**METAL CABINET PRESERVES FILMS** Attractive sectional self-humidifying film cabinet—each drawer built to house and preserve 12 films, is available to **FILMSETS** purchasers.

### FILMSETS GIVE YOU THESE IMPORTANT LESSON SUBJECTS

# Tomorrow's Goal

## Sound Motion Pictures for ALL Schools

Our armed forces have learned what our schools have long known, that talking motion pictures make learning easier, shorten the time required for instruction and increase the retention of important facts. Modern educators have looked forward to the day when this progressive method of audio-visual instruction will be available for all schools. Of course every projector we make TODAY goes to the Armed Forces. But TOMORROW all of Ampro's engineering skill and experience will be directed to the constructive task of helping teachers teach. Write for Ampro Catalog of 8 and 16 mm. precision projectors.

## It presents new teaching techniques

This illustrated 36-page manual was published by Spencer in the interests of better instruction through visual teaching. It contains a wealth of specific suggestions for the use of the opaque projector and includes some teaching techniques printed here for the first time.

The majority of summer schools conducting

courses in visual education utilize this booklet as a text.

More than 20,000 teachers interested in this subject have requested copies for their personal use.

Write Dept. C12 today for your copy.

### JAM HANDY Air Age Physics (Mechanics) Slidefilms Help The Teacher Increase His Effectiveness

The capable physics teacher, with the aid of textbooks and adequate laboratory equipment, will find his work most effective when he uses the new Jam Handy Air Age Physics slidefilms.

In this Kit-set on Mechanics are 742 pictures, charts, diagrams and cutaway views arranged in logical sequence on fifteen slidefilms. The instructor can present the sequences just as arranged on the slidefilms or he can make his own selection of pictures to fit particular instructional needs.

Any single picture can be held before the class until the concept presented is understood by everyone in the class. The pictures can be projected on a screen, on a light wall, or even on a blackboard.

Instructors who are teaching physics for the first time and those who have limited equipment for demonstrations will find these slidefilms of great assistance in presenting the subject.

Mail the coupon below to get your Kit-set promptly. Your set of these 742 helpful pictures can be shipped at once.

**742** Lighted, Blackboard Pictures in this Air Age Physics Slidefilm Kit-set. Here are the titles of the 15 slidefilms.

## The Post-War Heritage—

### "Priceless" Projectors

ON ARMISTICE DAY some 30,000 16mm motion picture projectors, now busy in war-training centers, will be orphans needing new homes. The ideal homes, most eager to take them in and care for them affectionately, will be some 30,000 American schools that have never yet achieved their "first projector." If such transfer can be effected, it will not only double the educational film market at a stroke—that market cannot grow save as projectors come—but will also definitely increase the new projector market. Whether such transfer can be effected, will depend wholly on the price to these schools. They could not afford a new projector before the war or they would have bought long ago. Projector salesmen saw to it that no school lacked invitation, argument, and inducement to buy. Only the money was lacking. None of these schools will have more money after the war, often even less. Some could scrape up perhaps 75% of the new projector price—more could manage 50%—but a full 30,000 schools could pay, say 20% of list prices, and would jump at the chance. Why not give them the chance by making these projectors literally as "priceless" as possible? It can be done, and to the definite advantage of all concerned—the school, the manufacturer, and the nation at large.

The service already rendered by these projectors deserves the honor of a distinctive name. Let them be nationally known as "War Projectors" or "Victory Projectors," available to projectorless schools. Of course, no school able to buy a new machine will be satisfied with anything less. But any school, unable to buy a new machine, will be proud to start with a "War Projector." Practice, experience, appreciation, enthusiasm then bring early ambition for another projector, a "new" one. A start is all the ball needs to roll. How soon it starts, and how fast it rolls, will depend on how the war-projector-surplus is handled.

### The Baruch Plan

The Baruch Committee offers a master formula for disposal of the vast total of war surpluses. In all respects—*save one*—it applies perfectly to the projector-surplus. The Plan insists upon moving the surplus promptly—upon scrapping what should be scrapped—upon no destruction of useful property—upon keeping the material out of the hands of speculators and promoters. Excellent! But then, Mr. Baruch would "sell all surpluses for all he can get" and "use the proceeds to reduce the National Debt." (!) (We started to figure by what fraction of a hair's breadth of one percent these projector sales would reduce the national debt—but gave it up). At least one outstanding firm in the projector field, before the Baruch plan appeared, announced its readiness to buy back all its machines that the Government will sell. We call that a shining example of perfect cooperation in advance. We hope, however, that such cooperation will not be needed.

The Baruch idea of "selling for all he can get" may be entirely sound for the mass of the war-surpluses. They will go largely to dealers, at fire-sale prices, for resale at a handsome profit to the general public. The general public (the non-white-collar part) will have more money than before the war—*its own money*—and can stand the luxury of paying a second profit on the same article. But the schools are in a very different category. They will rarely have more money than before the war, often less—and it is *taxpayers' money!* The taxpayer bought the original projector for the war services, paying the maker his full profit. He should not have to buy the same projector a second time for the schools and pay a second profit thereon. He should pay only re-conditioning costs-plus-profit.

If the projectors are "sold" to the makers the price to schools must rise, eliminating many potential purchasers. The projectors should be *given*, not *sold*. The gain to American Schools will be immediate and enormous—the loss to the National Debt microscopic and meaningless.

### When the Armistice Comes

Ship the entire projector-surplus back to the makers "without money and without price." At the war centers junk only the total demolitions. All the rest, even the seeming "wrecks," should be returned, each to its maker, for only the makers are qualified to decide what machines are worth repair.

It will be an economical "gift." It avoids the gigantic task of inspecting 30,000 projectors to determine sale-price. The prohibitive cost of such inspection would soon compel the guesswork of blanket appraisal which would result in a price "safely" and preposterously low. This would mean not only less payment on the national debt but, more importantly, lost values for the taxpayer and unearned values for the manufacturer. On such bargain-purchase the manufacturers could hardly avoid disproportionate profit on resale to schools. The "gift" plan saves for the taxpayer the values he has paid for and the profit he should not pay.

It will be a simplifying "gift." It moves the projector surplus with minimum delay. It closes the original transaction without complications. It saves endless bookkeeping. It leaves the armed forces with all possible values they could derive from the original purchase, and the manufacturer with his full profit paid. It allows all unused values to go back intact to the taxpayer when he buys the projector for a school.

It will be a profitable "gift." *The manufacturer* will profit, not on the "gift" but on further service. Such service he must supply and the school must pay the costs and full profit thereon. The costs will include handling, transportation, storage, inspection, adjusting, repair, replacement, refinishing, testing, reselling, packing and reshipment to the final school purchaser. Above all, the manufacturer secures, in every school where he sells a war-projector, a definite prospect for earlier purchase of a new projector. *The school* will have the benefit of a projector at a price it can afford and be on its way to better teaching. There will be new hope for a School Board awakening and more projectors in the far less distant future. The war-projector, rightly handled, can be the catalyst to precipitate swifter progress in the visual instruction field. *The taxpayer*, for once, will be paying no extra price or profit. He will have the satisfaction of helping his school now, instead of pouring his spoonful into the ocean of national debt. Incidentally, he might think, if the school is made to wait for the first installment to be paid on the debt what prevents waiting for the second installment, etc? Is it better to let the schools slide or the debt ride? Since the ride must be long, at least let the slide be short. Why use the taxpayers' money *now* for an infinitesimal nibble at a debt that is all but immortal, when the same money can start 30,000 schools *now* on the road to higher efficiency? The Debt can wait, will wait for generations. Educational progress should not be made to wait a single needless day. Finally, *The National Debt* itself may profit, vaguely by the "gift." Present-day minds seem unequal to the feat of knowing how or when it can be paid. Better minds might come from better schools and ultimately find an answer. At the worst, better thinking may prevent the creation of another similar debt, leaving the present National Debt alone in the glory of its all-time record, to shrivel slowly through the years, serving as a practically permanent and thoroughly wholesome reminder of our egregious spendthrift years.

Paper quotas say "stop." Our musings on "what price war-projectors to schools" must wait till April.

## The Change of a Name ~ the Maintenance of a Policy

E. E. Shumaker

V. C. Arnsperger

H. C. Grubbs

ERPI CLASSROOM FILMS Inc.  
*Changes its Name*  
 to  
**ENCYCLOPAEDIA  
 BRITANNICA  
 FILMS INC.**

**R**ECENTLY, the Encyclopaedia Britannica, itself an affiliate of the University of Chicago, acquired Erpi Classroom Films, Inc. Accordingly, it was decided to change the name of the company to Encyclopaedia Britannica Films Inc., but to retain the established product name of Erpi Classroom Films. We believe our many friends in the field of education will be interested to learn that policies will remain unchanged — and the new company will continue under the leadership of the same men who directed Erpi's destiny in the past.

Mr. E. E. Shumaker continues as President of the new company, and in addition becomes a member of the Board of Directors of Encyclopaedia Britannica Inc.

Dr. V. C. Arnsperger continues as Vice-President in charge of Research and Production, who will, of course, maintain the high standards for which Erpi Classroom Films are deservedly noted.

Mr. H. C. Grubbs continues as Vice-President in Charge of Distribution and will follow the same policies which have proved so successful in establishing Erpi as the leader in the field of visual education.

An out-of-the-ordinary educational activity correlating visual aids with a study program, developed as a by-product of the war emergency.

By **MERRILL BISHOP**  
Principal, Joel Chandler Harris Junior  
School, San Antonio, Texas

IT is an ill wind that blows no one any good. So it happens that schools are frequently forced into new projects by reason of some calamity to a program of studies. In order to make room for war emergency, our manual training shops were taken by the government and the question immediately arose as to the placement of these pupils in some course that would take care of them each hour. The answer was a large visual education class to learn by seeing as well as hearing, and as it later developed, by speaking.

The auditorium of the school was used, and two teachers were assigned, one a music teacher, the other a new type of teacher, an analyst and director of visual learning. The music of these classes was national. In some instances it was the music of a particular part of the United States, such as New England songs, Southern songs, cowboy songs, national songs, "God Bless America," "America," and "The Star Spangled Banner." Most of these had been learned in the elementary division. Repetition, the enjoyment of singing a song one knows, is really the major satisfaction of group singing. This part of the program takes only about one third of the period time, and is varied according to the time required for the picture. The words are copied from a large black board, and each pupil is required to have these words in a note book in which he keeps the analysis of the films he sees.

The films were chosen by national zones, such as the New England States, the Middle Western States, the Southwest, the Far West and the Northwest. The subject matter of the films was scenic and industrial. For example, the fishing of New England was one; the cotton mill and the shoe factory were others. To a child situated in the desert a ship is an unknown

object except as it appears in still life pictures; but to see a two master tacking, to see her keel as she dips to the wind, is a new and exciting experience. The action of the boat speaks much more clearly than all the words it takes to describe it. The haul of fish, the seines, the fish tackle, these are words now turned into action and actuality, and the vocabulary which has been read for so many years, meaningless and strange, becomes alive and imaginative. This is especially true in the retarded reader, or in the bilingual child, of whom there are many in the particular school in which this program has been tried. We forget so often that reading, to be pleasure, must create images or bring associations so that words have meaning. In a family of limited experiences the vocabulary must be limited, and its reading is correspondingly arid. The happy environment child, with many experiences, finds reading a renewed association of many forms of previous experience.

The moving picture has done more to enliven words than most teachers will allow. There are two methods of giving meanings to words, experience and definition. Fortunately for the retarded child, in visual education the definition is voided. The talking machine enhances the chance of getting the full meaning, but most retarded children have as much difficulty in listening as they have in reading. The picture moves too quickly for the retarded mind to keep pace with the voice. At least that is what some teachers feel who have been working on this experiment.

There is another fault, which is true in reading as well as in the spoken story. The vocabulary used may be far above the mind of the average retarded child, even of the normal child, and so he teaches himself

Keystone slides from geography units on New England (left, drying codfish) and Our South (right, picking cotton).

not to listen; as the youngster once said of radio, "I just shuts off listening." There is no remedy for this in our present situation. In our group are all types of minds and all types of emotional personalities. This being the case, the ends accomplished are intangible and cannot be measured except factually, not emotionally. Which is the real end, the facts obtained or the subjective attitude acquired? The latter is more important than the former in this course. What has been seen can be the more easily used in new experiences as well as in making over old experiences. The words New England States, may mean nothing objectively or subjectively; but once the connection is made between deep sea fishing and New England there is one thing known, fishing is done in New England, and emotionally have been felt the roll of the boat, the pull of the seine, the roll of the spindle, the tapping of the sole, the thrill of work. These are known factors from the moment they are seen, and the host of associations made by the film will be a frequent aid to project the recall of these pictures whenever the same emotional or factual experience occurs in some other picture. Experiences multiply as interest increases, words become images. Reading must take on new delights.

The three years in our junior school, seventh to

ninth, have two semesters in each, equivalent to six grades. Each grade, except the first, has a period of forty-five minutes a day in the auditorium for this course. In all about eight hundred pupils pass through the auditorium daily. Some exceptions are made, when the best interests of certain pupils are so served, but in general each pupil is required to have this background course on "Know America Through Her Resources." The long experience and fine cooperation of the Director of Visual Education, Miss Emma Gutzeit, have been major factors in the success of the project.

Two pupils are trained and assigned to the running of the machine and substitutes are trained for replacement in case of illness. The machine is in charge of one of the men teachers who is responsible for its upkeep, such as oiling and cleaning. Besides, each year the machine is forwarded to the Director of Visual Education who sends it to the factory for overhauling and repair. The teacher is relieved of as much detail as possible. The films are sent from the Director's Office to the school, and are returned by the school to that office. All the school does is to select and send to that office the names of the desired films. The Director of Visual Education orders and procures all films requested, if possible. If not, substitutes are made as

near the original as possible. These selections are made in advance for the next term or semester. Complete coordination between the school and the Director's office is essential, or the plan fails. Without a picture the class would be lost, for there would be nothing for it to do except sing through the entire period! For three years there has never been a single session without a picture, so well does the administration work. A remarkable record, and one which shows how effectively school officials can work together. It can be seen that the same skeleton outline, given above, can be used each term and yet the same pictures may never be used twice. In some instances, where it has been felt advantageous, the same picture has been used each semester, such as *Texas Cavalcade*, this being a Texas school.

Because of this excellent coordination the teacher can make plans for a very fine piece of notebook work. Each pupil keeps a notebook in which the analysis of the picture is made and correlation is established between the picture and the class subjects in the school. For example, an industrial picture naturally correlates with Occupations as a subject matter course and with Social Science. This appears in the notebooks and each pupil has his own choice of the correlation to be made.

From these correlations and skeleton outlines discussion takes place. Comparisons are drawn between pictures and the various correlations made by pupils in the class. Obviously these discussions are not the same in all grades, for the pertinent subject matter differs for each. In this way the pupil may indirectly see the growth in his own school progress.

(Concluded on page 119)

# War Films and the Classroom

Although the war has curtailed the supply of visual equipment to schools, it has made other beneficial contributions to education.

By EDWARD F. WHEELER  
Director of Audio-Visual Education  
Department of Education, Bristol, Conn.

MUCH has been written, and still more spoken, about the impetus to be given Audio-Visual Education through war training and information programs. Optimism blooms in anticipation of the rosy future of visual aids in our schools and the wonderful effect they will have upon public education. While there is much evidence to support these prophecies it would seem important to examine the present effect war conditions have upon the use of visual aids in schools and to estimate the values to be derived from these conditions.

Fundamentally there still remain the three requisites essential to the development of intelligent use of audio-visual aids in schools. First must come mechanical equipment needed; second, we must have the visual materials to use; and third, teachers must have the know-how—that is, they must know what is available, which materials are most valuable and for what particular subject area, and how to apply them intelligently. These three requisites to a successful audio-visual aids program are not necessarily stated in order of importance—in fact, to develop a truly successful program all three must be fulfilled.

At first it may appear that the war has had an adverse effect upon availability of equipment. Its immediate effect is to limit the amount available to schools at the present time. It must be remembered, however, that many schools possessing audio-visual equipment were not making maximum use of it, and the present difficulty in obtaining new equipment has emphasized the value of old and thus created additional use. We must also consider that, with proper priority and planning, most types of equipment can be obtained even under present conditions. Beyond these considerations, the technical improvements being made in equipment by advanced production techniques will prove

wholly beneficial in the long range view, despite the temporary difficulties occasioned by the war.

## Direct Skill Training Films

Judged on the basis of present values, war conditions have made their greatest contribution in stimulating production of training and informational films. The two major areas of such development, which will bear careful investigation by educators as to application in schools, are the direct skill training films, and those designed for general informational purposes for showing to the public at large. One of the first and most important demands of the war was the necessity for training great numbers of people in new skills. It was early recognized that this type of training could be greatly speeded up by the proper use of training films with the result that the armed forces, the U. S. Office of Education and independent producers developed hundreds of fine films of this type.

One outstanding result of this activity is a series produced under the supervision of the U. S. Office of Education covering such subjects as *Precision Measurement*, *Engine Lathe*, *Milling Machine*, *The Shaper*, *Bench Work* and similar topics related to machine shop work. Many of these films are well-suited for trade school use and industrial arts programs. Some, such as the *Micrometer* and *Vernier Scale*, are useful in high school science and mathematics classes. Just released by this source is a new series of visual units consisting of a training film, film strip and manual, planned as a teaching unit in a number of other technical subjects. One of the first to be announced is a unit on *The Slide Rule*. When we consider the scarcity of such material for mathematics classes during past years, it would seem that we are reaping real benefits right now from the war-time impetus given visual aid production.

(Left) A greedy shopper tries to get an extra ration. (Right) A black market transaction in the dark of the night.  
From "Partners in Crime," British Information Services film.

Another unusual series is that on "Office Practice" produced by the Navy Department and released through the U. S. Office of Education, covering basic and advanced typing techniques and shortcuts, operation and maintenance of office machines. Good material on this subject was virtually unobtainable before the war. Examination of the War Department publication FM 21-7 and literature from the U. S. Office of Education will reveal many more films on hundreds of different technical subjects now available—many of which can be well adapted to school use.

**General Information Films**

The general informational type of material, brought into being through war activities, may be of even greater immediate benefit to schools due to its wide range of subject matter and its suitability for many age groups. In this classification we have a number of films produced by the War Department, which at the present moment are unavailable for school use. In addition, we have a considerable supply from the Office of War Information, the Coordinator of Inter-American affairs and the film bureaus of many allied countries—all supplying films at moderate service charge to schools as well as to adult groups.

Primitive Indian method of planting corn, shown in the Disney film, "The Grain That Built a Hemisphere."

The most widely discussed and better known general information type film produced by the War Department is the "Why We Fight" series consisting of *Prelude to War*, *Nazis Strike*, *Divide and Conquer*, *Battle of Britain*, *Battle of Russia*, *Battle of China* (just completed) and *Battle of America* (still in production). This series is being produced by Colonel Frank Capra, of Hollywood fame, and is presented to members of the armed forces on the thesis that the best informed soldier is the best soldier. The series is designed to give an overall concept of this global war starting with world events leading up to and causing the present conflict, and covering the various phases of the war since its beginning. Presented from a remarkably impartial viewpoint, con-

Ships loading from grain elevators on "Great Lakes," title of film released by National Film Board.

sidering that they were produced during wartime, this series of motion pictures graphically illustrates the overall strategy and strength of our enemies, and the steps we have taken to combat this strategy. Generous use of animation in the form of maps and diagrams assist materially in making these films most effective aids for the study of the present world conflict. While these films are not immediately available for school use—many consider them rather "strong stuff" for that purpose—such outstanding material may perhaps not be denied the educational field indefinitely.

**Classroom Possibilities of War Productions**

Among the films released by the Office of War Information are many which will serve to enrich present day teaching. In the field of industrial activity studied in many social science classes, we find such material as *Aluminum*, *Arm Behind the Army*, *Bomber*, *Building a Tank*, *Lake Carrier*, *Right of Way* and *Troop Train*—all of which are good illustrations of various phases of industrial accomplishment. Films depicting customs, resources and characteristics of other nations include *Brazil at War*, *Dover*, *The Dutch Tradition*, *Listen to Britain*, *Pincers on Japan* and *Report from Russia*. Various other films deal with nutrition, gardening, conservation and similar subjects important to a nation at war and likewise of real value for school use.

The Coordinator of Inter-American Affairs has released many excellent films on Mexico, Central and South America too numerous to mention in detail. The majority are in color, skillfully produced, and of tremendous value to classes studying these countries. One of the most popular is the well-known travelog made by Walt Disney and his staff on a visit to South America in search of material for the production of a feature cartoon on that country. This is a film with a strong appeal to audiences of all ages. Some of the newer Disney-produced C.I.A.A. releases include *Grain That Built a Hemisphere*, *Water*, and *Defense Against Invasion*. These are, in effect, a new medium of com-

Bureau of Child Guidance, New York City Schools

**This timely discussion suggests some potentialities of the film as an effective weapon against juvenile delinquency.**

**B**ETTER human relations, better personnel and social relationships, can be developed through moving pictures used as a springboard for classroom discussion. Since the techniques in this use of human relations films are not generally known, we believe that report<sup>1</sup> of the experiences on which we base our conviction about the value of this medium will be of interest to other teachers. These experiences were part of our work during the fall of 1943, in the in-service course<sup>2</sup> on "Moving Pictures in the Program of Personality Adjustment".

The films we used are known as "The Human Relations Series", and were edited from feature photoplays by a Commission of the Progressive Education Association with Dr. Alice V. Keliher as the chairman. In the complete series there are over 50 excerpts from full length feature films. These excerpts cover such situations as the young child in his family, the older child in his social group, the young person choosing his life work, mob behavior, racial discrimination, relations of communities and nations. The running time of each excerpt averages ten to fifteen minutes.

The use of these films is to be markedly differentiated from the use of the instructional film designed as a classroom teaching tool. The usual procedure for the latter is to have a clearly formulated purpose for the use of the film in learning situations, to preview the film to determine how its elements will aid pupils in developing an understanding of the unit of work, to prepare the pupils before the film is shown by giving suggestions of some significant aspects to observe or by raising questions that can be answered through study of the picture, and after the showing, to have definite pupil participation in activities such as discussion, written tests, reading assignments, and projects for research and creative expression.

The human relations film on the other hand, is first previewed by the teacher so that she may be ready to lead a discussion. Preparation of students, if required, can be limited to questions of the "why" of certain behavior or situations in the pictures. When discussion is opened after the showing of a film the class can be asked what problems of human relations, of conduct, of behavior, they saw in the movie. The pictures stimulate the observers' feelings, attitudes, memories, and it is these personalized, indi-

<sup>1</sup>Collaborating on this report were five teachers of the course at the Julia Richman Junior High School—Bertha Balsam, Juliet Furman, Ruth Gadrich, Marion Scully, Margaret Wilhelm—and June Harris, Bureau of Child Guidance.

vidualized reactions which are the subject of discussion by the group. The teacher's role should not be one of judgment, but rather of acceptance. Conflicting points of view will inevitably be expressed, and the teacher, neither by word, tone, or gesture, should take sides. Learning by the pupil comes through the process of self-exploration created through class discussion.

Mr. Louis Relin of Benjamin Franklin High School, as an expert, first demonstrated the method for us. An excerpt from *Black Legion* was shown to a group of high school boys and girls, whites and negroes, of varying intellectual abilities, who came from Julia Richman and Benjamin Franklin High Schools. Mr. Relin then opened the discussion in a very casual manner by asking whether the picture presented a real situation. The response of the group was immediate. The film had aroused strong emotional and intellectual reactions. The discussion moved along swiftly and smoothly. It was so deftly and skillfully

handled that the direction along which it was guided was not apparent to the group and hardly apparent to the observers. Mr. Relin at no point attempted indoctrination or a superimposing of any personal opinions upon the group. At one point when a stalemate occurred he suggested sources for further study and research.

The excerpt dealt with economic prejudice, and the members of the class debated what they felt were the real reasons for racial and religious persecutions. Problems of minority groups, especially negro problems, were aired frankly and honestly in a most friendly spirit. One of the white boys, towards the end of the discussion, made a deeply moving plea for tolerance. This boy told how he often invited negro friends to his home, and how his warm welcome was reciprocated in their homes. The class finally had to be closed by Mr. Relin against the wishes of the boys and girls, who wanted to continue the discussion.

The next demonstration was conducted by one of the authors of this article to whom the method was completely new. The class assembled from several schools ranged in age from nine years to fifteen years, in intelligence quotients from 73 to 140, and in school placement from a class for children with retarded mental development in an elementary school, to a superior high school group. The film was an excerpt from *Captains Courageous* which portrayed cheating by a young boy. The teacher opened discussion by asking how many of the pupils enjoyed the picture. She then raised a number of questions as a basis for discussion, which included the following:

1. What do you think of the boy in this picture?
2. When we punish a person for doing something wrong, ought we to punish him only on the basis of what he has done, or ought we also to consider why he has done it?
3. Can you think of any incident in your own life when you did something wrong with a reason for doing it which was perfectly all right?

After the first ten or twelve minutes during which the students were slow to respond, the problems of spanking and punishment were mentioned. The entire class then participated in the discussion which progressed rapidly from incidents in the picture to personal experiences of punishment by parents and teachers. It was amazing how keenly these young people realized that punishment so often reveals the uncertainty and insecurity of the adult who punishes.

When we analyzed this demonstration lesson we recognized how difficult it is for a teacher to shift from the more traditional instructional method to an informal discussion method. Nevertheless, the permissive, accepting attitude of the teacher encouraged the free expression which finally swept the entire group. The personal experiences described by the children were stimulated, not by the teacher's questions, but rather by the feeling of security and the atmosphere of free inquiry in the group.

The Julia Richman girls had been so stimulated by the first session with Mr. Relin that they requested the formation of a Human Relations Club at which this kind of film would be shown. Several of the authors of this article were asked to sit in as faculty members and to guide the first few discussions. Three meetings held after school hours were attended by third and fourth year pupils with a wide range of intellectual abilities. Bringing together children of varying intellectual levels has been surprisingly successful. The brightest children do not seem to dominate, and the others do not seem to be overwhelmed. On the plane of human relations evidently, intellect is not the determining factor.

The choice of films was left largely to the discretion of a committee of pupils who studied the catalogue of the Human Relations Series. Through their first choice, *Emile Zola*, we were introduced to one of the pitfalls in handling a group of this kind. A discussion of race and religion, although lively and pertinent,

proved disturbing to some whose deep-seated prejudices were uncomfortably stirred. They were not sufficiently used to each other, to the technique of this type of exploration, nor to a free and open-minded give and take. The girls realized this mistake, but felt that eventually an esprit could be developed which would make possible open discussion of even the most delicate matters. They therefore decided to lay a firmer foundation by continuing with such films as *Alice Adams* and *White Angel* which deal with domestic and economic relationships. These problems, while vital and pressing, seemingly do not involve issues which create high emotional tensions.

The preliminary discussion after each film, was either discursive or launched directly at the heart of the problem. Eventually the girls revealed themselves, their experiences, sentiments, and problems. There was an atmosphere of good-will, and interest in others' points of view. Also noteworthy was the participation by every member of the group.

Such generalizations which have become apparent to us may be summarized as follows:

1. The discussion leader must proceed warily between the extremes of being too passive and letting the discussion disintegrate, and of being too active in directing the course of the discussion. She must be ready to pick up leads, to broaden perspectives, and to guide interests which manifest themselves, without attempting to elicit answers by leading questions-answers which may be no more than expression of lip service to socially approved ideals. She must be willing and ready to follow all lines of inquiry which develop.

2. Inherent in laying open certain problems in human relations is the inevitable danger of their explosiveness. On those issues which are causing worldwide strife and bloodshed, it is to be expected that repercussions will be felt by children. There is positive value in bringing these tensions to the surface and possibly vitiating their cankerous tendencies by deliberately examining them.

3. In using these human relations groups as a technique in "living together", we cannot claim that it will effect overnight a change in attitudes. We rather hope to develop the ability to discuss anything, openly and amicably, and with respect for others' points of view.

These few experiences with the Human Relations films suggest the excellent potentialities this technique has in a program for personality adjustment. One of its outstanding contributions appears to be the stimulus it gives to self-expression. Educators have come to appreciate more and more the emotional components of learning, and modern methods have proven the value of encouraging children to express themselves and to approach their studies as real life problems rather than as isolated academic drills. The stimulus and appeal of the motion picture is so great that even inhibited children tend to speak up and express opinions. With the imaginary situation as a starting point the child can gradually approach problems that concern him most in his everyday living. The fact that he can project his own problems onto fictitious characters lessens his self-consciousness and offers him a starting point. The intrinsic appeal of the motion picture char-

acters and the glamour associated with the players portraying them heightens interest and eagerness to take part in the discussion. Thus we have an excellent opportunity for the expression of feelings and opinions, for the exercise of critical faculties, for self-analysis, for sharing experiences, and for evaluating attitudes, prejudices, and the like. Some children derive emotional release merely from the opportunity of expressing themselves; others gain a sense of security in sharing their experiences or in realizing that others face problems similar to their own. To adolescents particularly, the realization that their problems are not unique is often a great relief and an opening wedge in helping them develop means of meeting their difficulties. From observing children in the groups described above it is clear that discussion meets a basic need that youngsters themselves recognize. All of the children derived great satisfaction and clamored for more opportunities for similar group meetings.

In addition to the release and satisfaction they offer children, the human relations films indirectly provide another means of developing beneficial pupil-teacher relationships. The points of view that are expressed during the informal discussions following the films are not likely to be evoked during regular class periods, and can be of inestimable value to the teacher in helping her understand the individuals in her class. Where the activity program has been adopted teachers have reported gaining added insights into the psychology of children through the opportunities the new program has given them to listen to what children have to say. The use of human relations films can offer similar opportunities for getting to know children better and understanding their problems more intimately, and is especially valuable at Junior and Senior High School levels.

In inculcating an appreciation of democratic principles, the type of discussion that can follow a human relations film offers a practical, living experience, more meaningful and telling than many a lecture. Tolerance, respect for the opinions of others, appreciation of factual evidence, fair play, critical evaluation of prejudices, take on meaning to boys and girls who have had an opportunity to witness and act upon them. Democracy becomes more vital when it is presented in realistic human terms with an emotional appeal. By utilizing constructively youth's inherent interest in the motion picture and the ego ideals already built up in connection with popular screen personalities, it is possible to develop deeply felt and lasting convictions. The specific situations portrayed in the pictures enabled the children to identify themselves with the victims of injustice and to experience the situations emotionally as well as intellectually. The conclusions they arrive at as a result of this kind of educational experience are bound to have a more lasting effect than those reached after a purely hypothetical intellectual discussion.

New attitudes seem to be immediately motivated by this method of exploring human relations. Some of the children organized a club; a number said that they would discuss these experiences at home in order to "educate" their parents. The dynamic, challenging reactions of the children are the basis of our conviction that this use of moving pictures is a unique method to help create better human relations.

# MOTION PICTURES— NOT FOR THEATRES

Installment 55.—An intercalary section about the waxing and waning of William Fox's notable school films program in pioneer talkie days.

By ARTHUR EDWIN KROWS

THE committee thereafter chosen by Col. Devereux for Erpi's educational program was well-balanced. Dr. Engelhardt, expert in school administration, had organized the educational systems of approximately sixteen States, Paul Mort was director of the Advanced School of Education at Teachers College; Alexander J. Stoddard, superintendent of schools at Providence, Rhode Island, was well known as a leader in his especial field and had even been known to Devereux previously as superintendent of the Bronxville schools. There surely should be expert guidance for an educational program here. But it was necessary, too, to have a "director of educational research" regularly at Erpi, and, on the advice of the committee, because his name had led all their lists of likely men, Devereux engaged to fill the niche Varney Clyde Arnsperger, an occasional special student at Columbia and regarded as an up-and-coming schoolman. Arnsperger, born in Grayson County, Texas, in 1896, was superintendent of schools at Drumright, Oklahoma, where oil wells had gushed unusually ample funds for education, and, in that place, had developed a system of cooperative industrial education known favorably as the "Drumright Plan."

that much might be accomplished if they could have a concrete illustration of the new possibilities of sound pictures in the teaching field.

Such non-theatrical sound possibilities as had been demonstrated then and were convenient, were some miscellaneous subjects produced by Fox Films. My recollection is that they included industrial shots of the printing of the *Chicago Daily News*, of weaving Mohawk Rugs, and of making Firestone automobile tires. There were also Fox newsreel items showing Chief Justice Taft administering the presidential oath of office to Herbert Hoover, with Calvin Coolidge standing by; George Bernard Shaw—obvious subject for a talkie—in a personal explanation of why he was superior to Mussolini, and a political statement by Lloyd George. The scheme was to use excerpts from these to illustrate a talk by some educator who would, of course, be duly presented at the start of the film, and would draw necessary conclusions when seen again in person at the close.

## Demonstration Pictures

THE choice of the educator to do this narrowed down to Harry Dexter Kitson, professor of education at "T.C.," probably because, in addition to his very full qualifications as an obliging gentleman not afraid to take a chance on a project which interested him, he was a specialist in vocational guidance and might be expected to know and to talk authoritatively about the world of industry. The amiable Dr. Kitson was thereupon hustled into a studio one afternoon, plastered with make-up, given a very limited time to decide what to say, and put before the cameras. The result, in two reels, entitled "The First Experimental Demonstration of Educational Talking Pictures," was not precisely cruel to Dr. Kitson, but it scarcely presented him to advantage. His voice was well recorded, however, and, with the interpolated shots, the resultant talkie served the transitional purpose very well.

The screen likeness of Dr. Kitson and prints of the interpolated industrial shots went into immediate service for the elaborate sales force, and for a time silenced the protests of insufficient demonstration material. The first programs were, indeed, rather an odd conglomeration for use in convincing educators. By now, in addition to the new Kitson reel, there were primarily the animated cartoon, "Finding His Voice"; a theatrical short in which Robert Benchley presented a monologue called "The Treasurer's Report"; a Libby-Owens-Ford industrial on the factory production of shatter-proof

glass; the *Chicago Daily News* subject; and the antic address of Bernard Shaw.

As it happened, Kitson shared his apartment with a young friend, Edgar M. Stover, who, while studying for a degree at Columbia, also was employed as a sales representative of the Erpi educational di-

(c) Baehrach

Dr. Alexander Stoddard was Erpi's expert on film usages in the elementary and junior school grades.

Erpi's first production group of teacher-training pictures threw some of the heaviest committee responsibility on Dr. Paul Mort.

At that early date the Western Electric Company was too busy meeting orders on theatrical installations to do much with the expected portable sound projector. The sales staff marked time, declaring that as soon as the machines could be had there would be a flood of orders. In the meantime the educational committee felt

vision. Stover, of course, knew what had been done, so, to further the cause, he and William Lewin, a young educator interested in school films (he was a high school teacher of English on leave of absence to study educational motion pictures for a doctor's degree at Columbia) arranged a showing of the new picture for the naturally interested other educators at Columbia. Now that I think of it, I believe that it was Lewin who had directed the production.

During the first few months in 1929, William Lewin, this young high school teacher of Newark, New Jersey, where Balcom had been so active in visual education, had visited Devereux urging upon him the importance of making a survey of the school market, especially now that existing surveys of silent film uses would soon be obsolete. The Colonel had agreed, and plans were made to send Lewin on a tour to "line up" the colleges of a wide area. Stokes, in the meantime, about July, 1929, had come from abroad to begin his new duties; and his first work was to assist Lewin in deciding where to go. Lewin then went forth, and in reasonable course of time returned with generally favorable reports from about fifty-eight colleges.

I had made Lewin's acquaintance about five years before when an advertising

Harry D. Kitson's good nature and high hopes for a noble experiment made him the guinea-pig of Erpi's first "educational" demonstration.

agency, which he had started in Newark while still a teacher at the high school there, undertook to develop industrial film accounts, and he wanted me to estimate on production for a prospect. With an earnestness which I later found to be characteristic, he was then grounding himself in the subject as a student of Mrs. Patterson's course in photoplay composition at Columbia University. His doctor's thesis, in 1933, was "Photoplay Appreciation in American High Schools." His brother, Albert Lewin, was at the same time on his way to his subsequent places as a successful scenarist and production supervisor in Hollywood. In years soon to follow, William Lewin was to begin his admirable work of developing motion picture appreciation as a curriculum subject in some thousands of high schools, this activity served in large part by his monthly *Film and Radio Discussion Guide*, published at Newark.

The next important undertaking of the Erpi educational committee was the production of a four-reel talkie on civics, entitled, "Our Government at Work." It was produced for the Erpi educational division by Fox Films, and Stokes was turned at once to the supervision of that project, involving for him an arduous examination of material which was to be taken for the purpose from the library of the Fox Newsreel.

It is advisable to digress here to explain this leaning toward Fox. The original Western Electric Sound System consisted of a phonograph record synchronized with the running picture. The method bore the specific protected name "Vitaphone." The possibility of putting the sound impulse directly on the film, instead of using the separate disk record, was well known. De Forest's Phonofilm was a popularly shown example of it, and the Bell System had long held patents on certain phases of the process, but acoustical experts held that the sound quality of the disk was much better. It probably still is better to their keen, trained ears

and to their delicate instruments; but the saving and convenience of having sound on the film was quickly manifest, and the original system was rapidly superseded by this combined form.

In this change William Fox figured prominently. In common with other Hollywood producers who had underestimated the talking picture innovation, he had seen the Warners start their skyrocketing rise with the sensational Vitaphone method of the Western Electric Company which they alone had agreed to take. He decided to capture some of the sure profits by contracting for another sound picture development which had been worked out by Theodore W. Case, an engineer of Auburn, New York, one putting the sound-track on the film, and brought to Fox's attention by Courtland Smith. Case, it may be mentioned, had been an important assistant to De Forest in his development of Phonofilm, but he was now working "on his own." Earl Sponable, co-inventor with Case, joined Fox as chief sound engineer. The negotiations of Fox and Case soon revealed that Fox could not proceed far without running afoul of the Bell System patents and, as the Bell people were willing to consider this other form of sound pictures, too, they signed an agreement with Fox to share in that development as well as with Warners in the current sound-on-disk variety. The newer method was called "Vitaphone." But both methods were known indifferently almost from the beginning, as the "Western Electric System."

Blackstone

Howard Gale Stokes was drafted for Erpi service from preferred work at Telephone headquarters. He believed in hewing to the line, let chips and glory fall where they may.

Possibly because the agreement with Fox was newer, it was somewhat more flexible at that time, and the Fox Eastern studios and laboratories, on Tenth Avenue in New York City, were not nearly so far from the Erpi headquarters offices as the Warner Studios and laboratories, formerly the Vitagraph plant at Flatbush, on the remote outskirts of Brooklyn. In ad-

dition, Fox was interested in developing the educational field, and Warners had no interest then, to speak of, in anything but theatres. Fox even then had made some talkie industrials. The organization also had, from its "Movietone News," an appreciable library of educational material upon which Erpi might draw. So the first of the formal Erpi educational talkies—excepting the Kitson "quickie," that is—made under supervision of the committee, was produced by the Fox staff with Erpi's close control. As the sound engineers were also generally former Bell Laboratories men, and sound engineers were the top authorities in talkie production, the work actually remained pretty much in the Bell System family.

"Our Government at Work" purported to show a visit by two schoolboys to the Washington office of the late Dr. William J. Cooper, then United States Commissioner of Education. From him, and from some other rather obvious agents, the boys learned—mostly through shots from the Fox library—about the functions of the main Government divisions. The staged sequences were produced under the direction of Richard F. Chapman, borrowed by Stokes from his regular work for the Fox Industrial Division. Dr. Cooper came to New York from the national capital to appear, and there was further coöperation by J. W. Crabtree, secretary of the N.E.A.

#### Fox Educational Talkies

IN making his agreement with the A. T. & T., Fox had tried to reserve to himself the exclusive newsreel license and an exclusive right to develop sound films for the educational, industrial, religious and scientific fields; and he felt that the A. T. & T. had violated the understanding by licensing other newsreels and organizing its own educational division. The reason Fox did not try to cause trouble over this, he said later in published statements, was because he wished to obtain a fifteen-million-dollar loan from the Telephone Company, and a condition to his receiving it was that he should drop all such charges of interference. This situation, however, naturally gave rise to a mutual distrust, and the Fox studio was no longer favored by Erpi for its own productions.

That William Fox genuinely wished to develop the non-theatrical field and had thought *ad interim* of the possibilities for many years is not to be doubted. His official educational and industrial division had been opened early in 1922 under Herbert Hancock, former head of Fox News. Fox had spoken many times about "the 250,000 churches and the one million classrooms" in America, and had estimated the revenue which might be made to accrue from their regular use of film. And he was not impelled by the profit motive alone, as justifiable as that might be. He had talked about putting films in churches and schools even if they paid nothing at all for the service; and, when he seemed to see millions for himself in the ultimately disallowed Tri-Ergon talkie patents, the philanthropic idea came upper-

most. The expanding library fed by the successful Fox Newsreel, and the recurring accomplishments of that competitor which owned the Pathé News, stimulated the entire conception; and Fox made several attempts to establish a really commanding educational department.

In 1926 the affairs of Fox News (run by a separate organization known as the Fox-Hearst Corporation) were placed under the direction of Courtland Smith. He it was who negotiated for Fox the deal known as Fox-Case. Smith, an outstandingly able executive, had been president of the American News Association from 1908 to 1921, then had become assistant to Postmaster-General Will H. Hays and, when Hays took command of the M.P.P.D.A., Smith had served as secretary of that organization. As head of Fox Movietone News, Smith promptly began development of the Fox educational idea. His editors endeavored not only to make the most of the established newsreel opportunities, but constantly investigated the possibilities of sound; and all this made grist for the educational project. The pioneer work was carried on with particular energy by the assignment editor, William O'Hagan Hurst, the same who had blazed so many interesting educational trails through the old Paramount Pictograph. In this latest place Hurst obtained what is said to have been the first sound newsreel interview—with Sir Thomas Lipton, arriving from abroad—while, among numbers otherwise contributing to the educational prospect, he seems to have helped to initiate those 1929 ex-

Lezen's already surround the name of William Fox. From the start he dreamed of the super film market awaiting in churches and schools.

assembled under Howard's supervision by, I believe, Harold E. Wondsell, were shown to educators attending the Dallas meeting of the Department of Superintendence of the N.E.A., February 25 to March 3, inclusive, 1927. The subjects were, "Raising the Submarine S-51," "Our Climate," and "Conquest of the North Pole." It may be noted incidentally that the exhibition was presented not at the convention hall but in one of the neighboring Dallas movie theatres. Each film was accompanied by an outline for teachers, recommending topics for pupil study before and after each screening. The entire projected program—that is, including others expected to follow—was given the felicitous general name "Fox Hour" pictures. The first service was to be on the obvious newsreel opportunity, Current History. Others in immediate prospect were Geography, Civics and Nature Study.

October, 1929, occurred the 25th anniversary of the William Fox advent in motion pictures. Fox made it the occasion to issue to the press a long statement of his plans for the next quarter-century, and the text was devoted mainly to non-theatrical aspects, promises to install a talkie projector in every classroom, in every church and parish house. He told of medical talkies being made by his people—of one reproducing a cancer operation by Dr. Nelson H. Lowry, of Chicago, using a radium knife (which, incidentally, being a commercial property, aroused some criticism of professional ethics among the doctors). Fox would soon be able, also, to tell of the caesarian section talkie demonstration by Dr. De Lee, another Chicagoan, and of various industrials, including talkie reels for International Harvester, Cadillac Motors, the Edison Company, Standard Oil of Indiana, Firestone Tire and Rubber Com-

pany, and a novelty subject for Armour & Company with prints of which a vice-president there simultaneously addressed thirty regional meetings of sales representatives in as many different cities.

These were made in the boom time of sponsored films by Richard F. Chapman. His work attracted the attention of Paramount, and he obtained similar work there almost until the Paramount decision not to take out an industrial Western Electric license.

However, for Fox in this period of revolution in the film industry there could be no golden season of peace in which a Croesus of education might work beneficently. To protect his already tremendous holdings, to care for expanding production schedules, it was necessary to enter upon a juggling of partnerships, pools, chains, holding corporations, financial trusts and all the bewildering expedients of modern business which is not merely Big but Gigantic and involves the President of the United States, Congress, Supreme Court justices, international banking, questions of worldwide peace and sums of money so fantastically tagged with ciphers that they could not possibly have significance as anything but paper profits and losses. It was a sphere in which the old-time wielder of mere personal power could not hope to survive for long, certainly not in competition with great governing boards. It was notorious that Fox rarely employed even a lawyer to counsel his decisions.

In this rarefied air Fox encountered another lone genius of finance, Harley Clarke, one-time wizard of the Society for Visual Education. Clarke by this time had pyramided his holdings in Acme and International Projector into a near-monopoly of amusement apparatus called General Theatres Equipment Corporation. He joined Fox first as partner in a scheme for wide-screen projection called Grandeur Films. Then he, too, revealed his intention to acquire theatre chains and studios and, by advancing steps, to take over the selfsame chains and studios held or coveted by Fox. In April, 1930, Fox had so far lost his power to the A. T. & T., the bankers, and Harley Clarke, that he sold out his voting control, and Clarke became for eighteen months the president of Fox Films.

#### Clarke Rides Again

DURING that eighteen months there arose one more remarkable manifestation of the non-theatrical idea, which is that sort of idea—an insidious, creeping, permeating notion—that, once acquired, it can never be fully shaken off. It had welled up in Harley Clarke in the time of the S.V.E., and he had never completely subdued it. Now, with theatrical interests to sustain him instead of unappreciative educators, he would prove his mastery. And yet, with all due regard for his natural leaning toward what must have seemed a providential opportunity, he was not unmindful of the lessons which he had learned so expensively. When the question as to the future of the educational pro-

(Continued on page 142)

William Lewin directed for Erpi its first college-professor talkie and made its first school survey.

periments at Auburn, New York, wherein Professor A. A. Allen, of Cornell, with P. Kellogg, and Albert R. Brand, a Wall Street broker riding a hobby, went hunting the songs of vanishing birds with a microphone.

Edward Percy Howard was made editor of the new Fox educational department and, after nearly a twelvemonth of investigation and experiment, three films

# The Film and International Understanding

DR. JOHN E. DUGAN, Editor

Haddon Heights, New Jersey, Schools

## From War to Peace in World Understanding Through Films

### Tremendous Expansion in this Field

THE expansion of the field of films for international understanding in connection with the war effort has been phenomenal and far beyond any previous expectation. The producers' and distributors' catalogues now coming off the presses list film after film in this field. Scarcely any program of any length fails to include something on the subject. There are films about our allies, about our enemies, about our new concept of a global world, and about our relationships to all of these things.

Last month we described the program of the Overseas Branch of the Non-Theatrical Section of the Motion Picture Bureau of the Office of War Information, a program involving the use of more than twenty different languages, and designed for the civilian audience in all countries outside of the western hemisphere not controlled by the enemy. The film program of the Coordinator of Inter-American Affairs for this hemisphere is too well known to need further description or elaboration here.

### Films to Win the War

All of these films and programs mentioned above are concerned with international understanding chiefly in connection with one great objective—the winning of the war. They may serve other objectives later, but victory is their immediate goal. And their contribution toward the attainment of that goal is tremendously greater than any man foresaw.

### What Follows Victory?

What about the days following victory? Will the contribution of films in this field of international understanding be just as powerful and important?

If we consider carefully what those days will be like and what services the film can render, we can conclude with confidence that the contribution of the film in the field of international understanding will be even more powerful and important. As bases for this conclusion, however, several things should be clearly understood:

1. The present objective of the use of films in this field is to help win the war.
2. There will not be an abrupt transition from war to normal peace conditions.
3. There will be a transition period during which the problems in this field will be unlike those of either war or ordinary peace times.
4. In the peace which follows the transition period, there will be other problems and great opportunities for the film to prove itself an instrument which can contribute much to world understanding and civilization.

### Films in Transition

Consider certain implications of the foregoing.

First of all, the transition period will present the problem of letting light and truth into those countries which have been darkened by propaganda and totalitarianism. The problem in the defeated axis countries will be somewhat different from that of the countries which were blighted by axis conquest and occupation; but in both cases a picture of the world as it actually is and their relationships to it must be presented. Then there is the problem of getting these peoples to understand the United Nations and their ideals. The film can contribute to all of these.

In this period of transition the chief aim is to bring back sanity and humanity. Reason and understanding must replace prejudice and persecution. The tenets of totalitarianism must be replaced by sound concepts of civilization, economics, philosophy, etc. An educational film plan for these countries, similar to the Educational Film Plan for the United Nations which was outlined by Dr. Herbert S. Houston in the May, 1943, *EDUCATIONAL SCREEN*, might render a mighty service in this connection.

But the educational task to which the film in international understanding can contribute in this transitional period is not limited to the vanquished. Our own people will need to know many things about these countries and the conditions and problems which exist there. For without mutual understanding there can be no real understanding nor any real and lasting peace, based upon an understanding of the problems to be met.

Foundations laid in these days of transition, through the use of films in the field of international understanding, can contribute much to the strength and permanence of the peace to follow.

### Films for Peace

When peace actually is established, the film will assume its rightful place as one of the great instruments of civilization, an instrument which can leap the barriers of language and distance to bring enlightenment, understanding and enjoyment to all the world. World outlooks and interests which were built up during the war will not vanish with the coming of peace. Men still will be interested in the rest of the world, will be more interested than ever in how others live, work, play and think, and the film will be an instrument which can tell all this and bind the world together.

### Immediate Implications

The foregoing discussion was not intended to be an idle look into the future. It has concrete and immediate implications. The film of international understanding is contributing much to the winning of the

war. If we wish it to make the same contribution to the winning of the peace, we must begin to look ahead now.

The four-point discussion of the sequence of victory was intended to show the road which we will follow and the steps which we must take. So far as the film and international understanding are concerned, taking those steps and following that road involves tremendous problems of personnel and equipment.

The personnel available has proved itself capable of producing and distributing films in many fields and many languages to bring about international understanding where it was needed to help win the war. Will it be available to help us to get through the transition and to "win the peace"?

We have distributed excellent projection apparatus throughout the world. Reports indicate that we can give an excellent showing of almost any film anywhere. This apparatus was bought to help win the war for a decent world and to bring about better understanding for establishing further understanding where it was needed. Will this apparatus be just as available for establishing further understanding and "winning the peace"?

So long as the armed forces need any piece of projection apparatus, they clearly are entitled to it. When the need no longer exists and the apparatus is to be disposed of, however, the needs of our educational programs, either at home or abroad, certainly should take precedence over any bargain sale, political gift, or carload auction.

## War Films and the Classroom

(Concluded from page 111)

munication as they depend largely upon animation techniques perfected by Disney. *Grain That Built a Hemisphere* is concerned with a history of the development of corn, its distribution on the earth's surface, its value to man as a food and as a base from which man, by the application of science, can produce materials to satisfy many of his needs. *Water* vividly illustrates the dangers of a polluted water supply and how to guard against such pollution while *Defense Against Invasion* is a most unusual presentation of the simplicity of and need for vaccination. This series of color shorts should be carefully examined by all educators as an indication of the type of teaching aid we may expect in great abundance after the war.

### War Production by Our Allies

The scope of film material produced by our allies is so extensive that we can consider only a few examples selected at random. *Partners in Crime*, released by British Information Services, is an unusual treatment of the black market situation. For school use it is a most interesting discussion type film for economics and economic geography groups. *Desert Victory* and *Target for Tonight* are two outstanding British documentary films of the war, available from the same service. While these are not classroom teaching films in the usual sense, they serve to illustrate in a most vivid manner two distinct types of warfare now being waged. A quite different subject is covered

in *World of Plenty* concerned with the production, distribution and consumption of food, both before, during and after the war. This is remarkably good material for classes in economic geography and domestic science. Britain also has made available numerous films on nutrition, health, gardening and similar subjects of value to schools.

The Canadian Film Board likewise has developed an extensive film program including consumer films, war production and subjects depicting various aspects of Canadian life. Among films of the latter type *Peace River*, *Iceland on the Prairie* and *Great Lakes* are sound subjects in natural color especially suitable for school use. *Peace River* deals with the most recently settled Canadian territory between Northern Alberta and British Columbia. The film outlines the settlement and activity of this district and points the contrast between pioneer settlement and modern development of the region today. *Iceland on the Prairie* gives an intimate glimpse of the Icelandic settlement on the Canadian prairies including agricultural, professional, and business developments. Perhaps the most popular of this series in schools is *Great Lakes* which was designed to convey the idea of the Lakes as one of the greatest industrial settlements on earth, with an immense flow of diversified cargoes flowing along the shipping routes between the U. S. and Canada. Included are sequences on transportation, steel production, pulp manufacture, shipbuilding and grain storage. Many of our other allies have made available motion pictures valuable for school use.

The Army, Navy and commercial producers have, of course, produced hundreds of training films not pertinent to this discussion. But, unquestionably, the war has added importantly to our store of films that are genuinely educational, and has likewise taught us to value equipment presently available and to make the best possible use thereof. In addition it has speeded the perfection of many types of projection equipment which will be available to schools after the war. Finally, and not by any means the least important, experience in war training has emphasized to educators and the public the urgent necessity for the intelligent use of visual aids in any efficient educational program. Without question visual education will develop after the war as a direct result of war training experience. But, further than that, visual education in our schools has already made great advances as a definite result of war conditions. Destructive, wasteful and heartbreaking as war is, we must learn to recognize those small gains brought about by the conditions it creates, and waste no time in putting into practice the constructive lessons it does teach.

Note: Further information relative to the motion pictures mentioned and the name of the nearest distributor may be obtained from: War Department, War Activities Committee, Room 1351 Paramount Building, New York City. ## Teachers' Reactions to Visual-Aids

By Superintendent WILLIAM E. GILLIS  
East Haven, Connecticut

IN speaking to one of our teachers recently concerning her reactions to the values of audio-visual aids, she stated that quite often pupils retained a great deal from films which have been used in connection with planned lessons. Sometimes the response is not immediate but will come up during a discussion long after a picture has been viewed by the pupils. Some of these responses are brought out by questions of the teacher but many are the spontaneous reports given by the pupils.

One of the difficulties in using pictures is the need of a sufficiently darkened room, another is to educate the children to the fact that motion picture time is not necessarily entertainment time and that there is something to be learned from every picture. The third obstacle, which unfortunately still exists, is the misuse of motion pictures. It seems difficult for some teachers to realize that films should be shown with a purpose and are not just something with which to take up time. Teachers often seek invitations to pictures which are planned by another teacher in the building, regardless of the type of picture or the age of the pupils. This is a sheer waste of time.

One of the other teachers stressed the use of still flat pictures on bulletin boards. It seems advisable to avoid constant use of sound pictures or motion pictures. Wise use of material for bulletin boards will give pupils time to think over the implications which should result from the pictures. Such material serves the need which fleeting motion pictures do not meet.

## Visual Aids at Dartmouth

C. N. Allen, Director of Dartmouth College Films, gives us the following report on the use of films in their V-12 program.

"One full time program of motion pictures, slide-films and slides, both as visual aids and as morale builders, is being carried on at Dartmouth College where the largest V-12 Unit in the country is located. The usual classroom movies are shown on a larger-than-ever scale with some departments using movies where they have felt in other times that available pictures were not of College level. Part of the improvement in this respect is due to the use of technical films provided by the Navy and by the greater availability of more technical films from commercial sources and research organizations. In addition, Dartmouth College Films has entered into a contract to show the excellent G. I. Movies which are distributed to all armed forces scattered in various camps all over the world. These movies are always carefully planned to present a balanced diet of current news releases, more serious background and morale building topics (such as *Plan for Destruction*, which describes Haushofer's elaborate theory of Geopolitik), and comic cartoon relief. Finally, the Hanover P. T. A. is working with the local school system to develop a larger and more integrated program of motion pictures. Many New

Hampshire schools will be benefited by the availability of government-owned movie equipment after the war, when they can buy within their budgets equipment which is no longer needed by the government."

## Wheeler Resigns

In a letter addressed to the members of the New England Section on February 14th, Edward F. Wheeler announced his resignation as President of Zone 1. The letter reads as follows:

"It is with great regret that I tender my resignation as President of this Association effective February 15, 1944. After March 15, 1944 I shall be associated with General Motors Institute, Flint, Michigan as Supervisor of Visual Aid Development. While I leave my present work with reluctance and feel that I shall sincerely miss the many pleasant associations with members of Zone 1, it is with considerable interest that I anticipate the small part I may be permitted to play in the rapidly growing field of industrial training.

"I cannot urge too strongly the importance of maintaining and strengthening the Department of Visual Instruction. I feel it represents one of the most important trends in present day education. We must all recognize the powerful forces acting as an impetus towards speeding the development of the audio-visual field. It is likewise our mission, as members of the D.V.I., to see that these forces and the attendant progress of the field is brought to the attention of those charged with the responsibility of shaping school policy. For the above reasons I strongly urge that each member give his full support to all activities of our association. Contributions to the bulletin, expanded membership, attendance at conferences, and similar professional activities are all needed for the development of our field.

"My duties as president will be most efficiently discharged by our Vice-President, John Gammons Reed, Rhode Island College of Education, Providence, R. I. I am sure you will all give him your unqualified support."

Edward F. Wheeler has been one of the outstanding leaders in this field for the past ten years. He started out at Bristol with one projector and a corner of a classroom. Today he has developed that into a department composed of thousands of dollars worth of visual equipment. Under his leadership visual aids have become a vital part of the educational program of the City of Bristol. When the Connecticut War Council wanted a man to develop a film library and film program for the State they called upon "Ed" to do the job. He has, during the past year, developed this program to such a high degree that War Council Films are being shown in practically every community of the State. This position as Chief of the Film Section of the War Council is being taken over by David Strom, Director of the Visual Aids Center at the University of Connecticut.

We of New England are going to miss "Ed" greatly, but we do know that through his new position he will be able to further the use of visual aids in a field that will eventually influence educational policies throughout the country. We of New England, "Ed", extend to you our best wishes for success in your new venture.

**An innovation by New England—a page of its own for telling its own story.  
Let the nine other DVI Zones read, weigh, and act accordingly.—N.L.G.**

# Caring for Young Children — In Hand-Made Lantern Slides

By ANN GALE

Roosevelt High School, Chicago

CARING for the young children of employed mothers is a very important contribution to the war effort. High school or college girls who do this work could be trained by illustrated talks given by the dean, the health teacher, or some one from the Parent-Teacher group.

The main rules are to keep the child physically comfortable, to help him in learning to be his own manager, and to keep his play on a creative level.

1. The child must know that his mother is leaving, and that the person in charge is one his mother respects and therefore places in full authority.

2. The assistant should know the child's routine, food

habits, and bedtime procedure. She needs to know where to reach the mother and the doctor in an emergency.

3. Well cooked and attractively served food will help in making mealtime pleasant. Small portions should be served, and no comments made on uneaten food.

4. The child needs to be relaxed before going to sleep; so quiet games are best at bedtime.

5. Bathroom procedure should be handled pleasantly in a spirit of fun.

6. Creative games where the child depends on himself are more fun for him. Having several different toys ready is a good idea, for children tire easily.

The simplest type of hand-made slide is made by drawing or tracing on finely finished etched glass with ordinary medium lead pencil. Color, by special crayons or inks, enhances the slides greatly. Fine effects are obtained by blending with crayons. About one-third inch margin should be left all around the slide. The slide is readily cleaned with soap or washing powder to receive a new picture.

## Women's Colleges and the War

A CLEVER variation of the usual college public relations film is the 1000-foot production reported by Eunice De Clark Davidson, Alumnae Field Secretary, New Jersey College for Women, New Brunswick. Mrs. Davidson's account of this unusual film follows:

"*College—Designer for Democracy* represents an attempt to show, through the medium of the motion picture, the contributions and adjustments that the liberal arts college for women is making in these war years and as a preparation for the peace to follow. Although this motion picture in 16mm. kodachrome was made by the author of this article for New Jersey College of Women, was filmed on the campus of that institution in New Brunswick, and shows its students and professors, the film speaks for all colleges of N. J. C.'s type.

"When it became apparent that New Jersey College for Women needed a new reel of motion pictures for use with alumnae and preparatory school groups, the staff member responsible felt that it would be completely insensitive to the mood of the times to create the usual 'campus tour-college-life' type of film and searched

of the first day back on campus resolves into a close-up of the printed program for the opening Convocation. Faculty members are seen lining up in their academic vestments, choir members in the basement of the chapel look over their music before the service begins, and student feet hurry along the paths and up the chapel steps. Many devices are used to create the effect of nearly a thousand girls entering the chapel and of all the college group hastening to Convocation. The hands of the organist on the keys and a shot of Dean Corwin on the chapel platform precede the choir processional, which is followed by the entrance of the senior class in cap and gown. Great use of close-up is made throughout—of hands, of hymnals, of the varying expressions on the faces of the students.

"The processional hymn concluded, the student body is seated and Dr. Corwin rises to give her Convocation address. Only the actual words of her speech are given in professionally made captions. All other titling is accomplished by the reproduction of legends appearing on programs, books, signs, et cetera. The content of each of the eleven captions which give Dean Corwin's own words studiously avoids the mention of New

(Left) An art class at New Jersey College for Women. (Right) Dormitory scene.

for a theme that would portray, in some measure at least, the important intangibles of a large liberal arts college. The device of using the Opening Convocation of the College as a skeleton framework was finally chosen and this chapel ceremony, highlighting the year's keynote speech by Dean Margaret Trumbull Corwin, provides the setting.

"The film opens with a shot of the College newspaper announcing Freshmen Registration Day and with glimpses of students returning to campus after the summer recess. The excitement of the first days of the fall semester is suggested by the greeting of old friends and the settling and decorating of dormitory rooms. A fade-out as two roommates retire at the end

Jersey College for Women and phrases the message in terms of college in general.

"The several direct quotations from the address which are reproduced, one by one, on the screen summarize eight outstanding reasons for college at the present time: (1) the academic and technical training provided for subsequent war jobs and intelligent citizenship, (2) college emphasis on physical fitness, (3) the campus as a 'laboratory for democracy,' (4) opportunity for community service, (5) the importance of college friendships and traditions, (6) 'the right kind of laughter,' (7) a deepening religious faith and (8) the

Now's the time to start  
 planning how your school  
 will make the best use of an

# RCA *FM-RADIO* SYSTEM

FM (frequency modulation) radio, first introduced in 1938, has proved itself to be the most practical type of radio for school systems.

Already several big city school systems have FM transmitters, and there is literally no limit to the educational advantages of radio when the broadcasting can be controlled within the school and the school system.

### WHAT FM CAN DO . . .

Here, for example, is a recently compiled list of FM uses: news and current events programs adapted for age levels; subject motivation programs; supplementary aid programs; teaching by radio; story-telling; guidance programs; library programs; talks by prominent guests; In-Service teacher training; adult education programs; music for special activities; announcements; student talent programs; forums and discussions; sports; community cooperation programs; holiday and special events;

school public relations; programs for handicapped children.

### RCA — A LEADER IN FM DEVELOPMENT

RCA has been and will continue to be a leader in the development of FM transmitters. That's because RCA engineers have more experience in building (and operating) radio transmitters than any other group. Furthermore, RCA has always pioneered in the development of high-frequency antennas and is now building many models for the armed services.

### GET THE FACTS ABOUT FM

While the war has stopped production of FM transmitters and receivers for civilian use, those connected with school management will certainly want to learn about FM to help them do a better job of post-war planning.

A letter or postal card addressed:—The Educational Department, RADIO CORPORATION OF AMERICA, Camden, N. J., will bring details concerning RCA's FM Transmitters.

RCA Victor Division — Education Department  
**RADIO CORPORATION OF AMERICA**  
 CAMDEN, N. J.

dual privilege and responsibility which every college girl should feel today.

"After each caption a close-up of an individual senior, listening intently to the words, is seen and then her face fades into a shot of that same girl engaged in some college activity which illustrates the point under discussion. In some instances three or four different personalities, with their respective experiences, make vivid a single topic. Students at work in science laboratories and art studios, various sports, student government activity under the College's dynamic and treasured Honor System, special war courses and fund-raising drives on campus, 'bull-sessions' and formal N. J. C. traditions, amusing situations in the dormitories, and religious discussion groups provide typical examples of the personal memories into which each student translates the message she is hearing. Closeups of Dean Corwin's expressive face and of the intent, responsive expressions of the girls themselves lend a deeply personal appeal.

"The 1000-foot film concludes with the convocation recessional, and the figures of the departing choir members fade into darkness. For the opening title and 'The End,' plasticine was used, with a tool tracing the words in the clay, as this seemed to provide an artistic medium in keeping with the title itself.

### QUESTION BOX ON SCHOOL FILM PRODUCTION

**Question:** Please explain parallax; how it occurs in the movie camera, and methods of correcting it.

**Answer:** Parallax may be defined as an apparent displacement of an object due to the relative position taken by the observer. To illustrate this phenomenon more clearly, I tell my students to stand about two feet away from a wide bulletin board. Each student covers his right eye and scans the field he can see with his left eye. He is told to select some object that occupies the center of the field, and to keep that in mind for the next part of his experiment. Standing in the same

#### Diagram Illustrating Parallax

With a camera having the viewfinder  $1\frac{1}{4}$  inches to the left of the camera lens objects placed in the center of the field at various positions will appear exactly as shown in viewfinder. If pictures are taken with the camera in this position, only those parts which are shaded will appear in the film. From this diagram it is apparent that the further away the object is placed from the camera, the lesser will be the problem of parallax. (Beyond six feet this problem does not exist for 25mm lenses.)

"The film is silent, with a running time of forty minutes. Although sufficiently meaningful through its titling, the picture gains much in effectiveness, however, from the spoken commentary with which it is usually presented. N.J.C. motion pictures are generally shown by the alumnae field secretary or some other staff member and so sound has never proved a necessary addition to the many films which the College has produced. All shots were made with a Cine-Kodak K, having a 1.9 lens, and Type A kodachrome was used throughout, since it was constantly necessary to shift from indoor to outdoor scenes. A detailed scenario was prepared before any pictures were taken, but most of the lighter touches in the film were permitted to develop spontaneously according to student suggestion.

"*College—Designer for Democracy* has been shown to over 12,000 persons since its completion in October, 1942, and is in almost constant use this year in connection with the field work program of N.J.C., which is celebrating her twenty-fifth anniversary during 1943-1944 with a large number of alumnae-sponsored birthday parties at each of which the film is shown. Fortunately its message is every bit as true for the current year, and probably will remain so for the duration of the war, as it was for the time at which the picture was made."

position, without turning as much as one degree, each student now removes his hand from the right eye, and by similarly covering his left eye, views the field in front of him. It is quite apparent to all that the object which occupied the center of the field of the left eye is almost pushed out of the field of vision of the right eye.

This experiment becomes meaningful when the students observe that the positions of the viewfinder and of the lens in their motion picture camera parallel those of their eyes. They begin to realize that for close-ups, six feet, and under, the lens does not "see" everything exactly as revealed in the viewfinder. We are now ready for some mathematical calculations.

Two sets of figures are necessary before we can devise ways and means of overcoming parallax. The distance between the center of the lens and the center of the viewfinder can be carefully and accurately measured. The second figure, the angle covered by the 25mm. lens of the camera is furnished by the manufacturer. In the case of most 16mm. cameras the horizontal angle is about 21.5 degrees, (the vertical angle about 16 degrees). Our own camera, having the viewfinder on the horizontal plane and  $1\frac{1}{4}$  inches to the left of the lens, gave us no trouble in making our calculations.

In making close-ups showing the pulsations of the blood vessels of developing chick embryos (see EDUCATIONAL SCREEN, June 1943) we had to work as close as one foot from the embryo. In order to find out exactly what our lens could "see" at that distance and beyond we made the following diagram on the blackboard. At a distance of  $1\frac{1}{4}$  inches apart, representing the distance between viewfinder and lens, we drew two angles of 21.5 degrees in such a way that their corresponding sides were parallel. Next we drew bisectors of these two angles. The points on these bisectors were now regarded as the centers of the fields covered by the viewfinder and the lens, respectively.

One foot in, the bisector of the left angle serving as the center, we drew an outline of the egg. By noticing how much of the egg is revealed in the second field (lens) we could tell that only the right portion of the egg would show up in the film. (See accompanying diagram.)

In order to get the egg to appear exactly in the middle of the field of the camera lens it becomes quite obvious that if we could place the camera lens in such position that it could "see" what the viewfinder "saw" our picture would appear in

(Concluded on page 141)

Make PHYSICS classes  
 More Interesting—More Effective  
 By using the  
**KEYSTONE**  
 PHYSICS SLIDES and REVISED MANUAL

Four Manuals in One

- The Fundamentals of MACHINES
- The Fundamentals of SOUND
- The Fundamentals of LIGHT
- The Fundamentals of ELECTRICITY

To assist in the more effective illustration of problems and theory of Physics, Keystone View Company offers a visual presentation method employing carefully prepared slides and a completely revised and enlarged manual—really four manuals in one.

Through the use of this well-planned instruction system, student attention is focused on the material presented in the slides; therefore a more complete understanding of the subject is acquired.

Developed by war needs for faster, more effective training of students in basic Physics, this improved method will prove invaluable for better teaching in peacetime. It should be in YOUR school.

### POSTWAR VISUAL EDUCATION

**What the Well-Dressed School Will Wear**—William Dow Boutwell, Director of Information and Radio Service of the U. S. Office of Education—*National Parent-Teacher* 38:27 January, 1944.

Much that will make the school of tomorrow modern can be found in the training camps of today. The Army and Navy have found how much faster and how much more easily troops learned from audio-visual aids. The author recommends the following installations for the postwar school: teacher and student-operated projectors, a more flexible school schedule, simple provisions for darkening classrooms, electrical outlets conveniently placed, portable 16mm sound-film projectors (one projector for every two classrooms), radio receivers for every classroom, portable radio playbacks, filmstrip projectors (approximately one for every two classrooms), public address equipment, central FM radio station operated by the school board, mirrorphones, larger libraries, laboratory workshops, listening tables or rooms, new charts and pictographs, and television receivers eventually (potentially a more effective aid to education than radio).

**Films and Education**—V. C. Arnsperger, Encyclopaedia Britannica Films, Inc.—*Sierra Educational News*, p.20 February, 1944.

"Any program of education for the future must contemplate the use of all technological advances which will contribute to the effectiveness of classroom instruction." Increasing demands will be made steadily on our educational system to provide our people with the knowledge and understanding which will equip them to participate intelligently in the modern world. Reading alone is adequate today. To meet this demand for more education for more people there must be a readjustment of the educational program both in content and in method, with a more efficient presentation of instructional materials. The expanded use of the soundfilm is seen as a result of the necessity for vicarious experience through the visualization of concepts.

A greatly expanded program of teacher education is a "must" if this modern aid is to be used effectively. There must be a more complete integration of the film with the school program. The major areas of study in which films for the modern school should be produced are: Conservation, Regional Geography, Modern Science, Historical Perspective, and Recognition of the Individual.

**A Plea for a People's University on the Radio and Screen**—Margaret Monrad—*The Social Studies*, 35:51 February, 1944.

"Who are the real enemies of democracy?" asks the writer, and points out that we, ourselves, are—we who have taken our democracy for granted and have never even taken the trouble to use our vote. "The problem of keeping any democracy alive and growing is synonymous with the problem of the continued education of its adults. Adult education, including that of the heart as well as the mind, is the only safeguard for democracy."

We have no schools for adults comparable to the Danish folk schools, which have been an important factor in the transformation of the Danish farmer, but neither are conditions here comparable to those of Denmark. "However, as if to solve this most vital problem of sustaining our democracy by adult education, we have been given a new and marvelous invention by means of which the spoken word may reach all of our vast and varied population. With the advent of the radio, we may have a people's university in truth, as wide and as free as the air over which it speaks." The writer laments our failure to avail ourselves of this means

to the fullest extent possible to educate our own people for our pattern of life, to stimulate them to higher thinking and instill in them a desire for something more than material gain, thus imparting ideals as well as knowledge. "There is no end to what might be accomplished if all existing educational forces could unite to establish a great people's university on the air, whose staff was dedicated to the building of a better world." The author declares that the carrying out of such a program may very likely necessitate that broadcasting stations be placed under the control of the Office of Education.

The educational potentialities of the moving picture are also recognized, but like the radio, such an invention, affecting the cultural education of the masses, belongs to the people and not to money-making corporations.

**Can Our Schools Teach the G. I. Way?**—Walter Adams—*Better Homes and Gardens* 22: 30 February, 1944.

It is significant to find a popular magazine concerned with the teaching technique employed by our armed forces, and the effect it will have on the teaching methods in tomorrow's classrooms. If schools adopt the Army-Navy technique, the class will learn a foreign language as a child learns his own language—by listening to and imitating native speakers provided by records. This language technique is one of those our armed forces adopted to teach faster than anyone had ever taught before—teaching the "bread-and-butter" essentials of a language in eight to twelve hours. With them, education is the intense application of such visual aids as charts, diagrams, movies, cartoons, strip films, sand tables and cutaway models. Educators help work out the techniques, and psychologists help determine aptitudes and place men in the jobs to which they are best suited.

Of all teaching aids, the movie film is declared to be most versatile. Outlined is a sample teaching-film-technique, pointing out the desirability of preparation before the film showing, and a thought-provoking quiz following it. Illustrating how real a film can make a subject, the writer tells of two men who had to be carried out at a showing of a first-aid film in one basic-training class.

Teaching must be tops—the old education isn't enough, concludes the article. "Either we help improve education this way, or we find another way."

### UTILIZATION

**Report from Virginia**—Donald Slesinger—*Film News*, January, 1944 p. 2.

The Extension Division of the University of Virginia undertook to explore by first hand contact the possibilities of using films in community programs. Jean and Jess Ogden were sent out to three counties, and within the limitations of projection equipment and few suitable films, programs based on nutrition and later, on health, history, resources and contemporary events, were developed.

The groups attended with enthusiasm, attracted by the novelty of movies, and often led to follow-up which "was not discussion; not conversation; maybe not even communication. Out of the dark had come a parable, and explanation rose naturally to the lips of the speakers. Sometimes the lesson was wrong, but not so far wrong that a little tactful remark could not correct it." Among the tentative conclusions are these: that movies better than any other medium can bring people together; that people believe what they see on the screen beyond means of communication; and that films better suited to rural audiences are needed.

# STANDING UP UNDER PRESSURE

Holmes Projectors made for both civilian and government uses have shown the greatest stamina in day-after-day, year-after-year operation.

Our armed forces still need all our present output, but at the earliest opportunity we'll resume production of new projectors for schools and the general public, built to exacting Holmes standards.

**How to Use Audio-Visual Aids: Part 3. Radio, Recordings, and Use of the Microphone**—Elizabeth Goudy and Lt. Francis W. Noel, USNR—*Business Education World*, 24:258 January, 1944.

Radio broadcasts and recordings can be valuable teaching-training tools. They can motivate, convey information, build attitudes, and develop auditory skills. This article discusses possible uses of these aids as applied to business education. Many commercial radio programs, for instance, offer students dictation and note-taking experience, vocabulary study in many occupational fields, and the opportunity to study at first hand basic advertising techniques. Recording equipment can be used to improve telephone techniques and improve speech. Short skits over the microphone set up with a loud speaker can illustrate many aspects of junior business training and secretarial practice. There are also available a few commercially prepared recordings directly bearing on business practices which provide practical teaching aids in business courses.

**Films for Schools**—William P. Davies, Albuquerque High School—*New Mexico School Review*, 23:14, January, 1944.

A teaching or classroom film should be distinguished from an educational film. The former is defined as one which was written and produced for the classroom after much preliminary research and planning, followed by experimentation in classroom situations. Educational films may be dramatizations or the description of an industrial process. They include many sponsored films (industrial or public service-sponsored), theatrical shorts and excerpts. The latter type are usually free. The superior educational effectiveness of classroom films is usually acknowledged by most teachers.

**Film Educational Program at E. N. M.**—Ruth Midyette—*New Mexico School Review*, 23:15, January, 1944.

A weekly program of educational films is available to the students of Eastern New Mexico College and to the general public through the college library.

### FILM GUIDE

**Food: A World Problem**—Film Discussion Guide—by Frank Ernest Hill, Educational Film Library Association, Inc., 45 Rockefeller Plaza, New York 20, 50c. 50p. 1944.

Although prepared with special reference to the film, "World of Plenty," a British Ministry of Information film presentation of our most important postwar problem, this Guide can be used with other films dealing with food as it covers the entire problem of food, considering aspects of the question which can not be covered in a short motion picture. The purpose of the Guide is to lay out the ground that may be covered in the discussion of Food. It presents facts and opinions, suggests questions to be considered, lists articles, books and pamphlets on the subject, and shows how to conduct a discussion. In addition to summarizing the contents of the picture "World of Plenty," eleven other films on food, which treat some of the problems raised in the guide, are fully described.

The Introduction explains how to use the Guide. Use of it should save discussion groups considerable time and effort in the carrying out of their programs.

### DISTRIBUTION

**16mm Exchange Practices**—B. A. Aughinbaugh, Director, Ohio Slide & Film Exchange, State Department of Education, Columbus—*Film and Radio Discussion Guide* 10:7 January, 1944.

One of the most grievous problems with which a film distributor has to deal is the return of damaged reels by a customer. All sorts of plans have been tried in the attempt to eradicate this costly nuisance. Mr. Aughinbaugh describes the successful plan put into operation by the Ohio Film Exchange which put an end to the unsatisfactory reel condition and prevented friction between the Exchange and its customers.

SOURCES OF INFORMATION

**Victory Gardens for Community, Home, School**—compiled by Lili Heimers—Visual Aids Service, New Jersey State Teachers College, Upper Montclair, N. J., 25c 4p. 1944.

A list of sources for films, filmstrips and publications on Gardening, with brief description of contents of material available. Audio-visual and teaching aids concerned with the fight against injurious insects, and the preservation of the victory crop, are also given.

**War Films for War Use**—Office of War Information, Bureau of Motion Pictures, Washington 25, D. C. February, 1944 20p.

This is the latest catalogue of Office of War Information 16mm motion pictures available as of February 1, 1944. The films are listed alphabetically by title, with contents summarized. For quick reference as to films on a particular aspect of the war, the titles are classified under the following subjects: our fighting forces, the people of our Allies, the nature of our enemies, news reviews, the production front, the farm front, the home front, song shorts. Distributors are given in state order.

**A PUPIL-PRODUCED MOTION PICTURE PROJECT  
IN THE ALEXIS I. DUPONT HIGH SCHOOL.**

Investigator: THOMAS W. HOWIE.

Summary of doctoral dissertation completed for degree of Doctor of Education at New York University, 1943.

A running description of ten chapters presents the production of a documentary motion picture, "The Delaware State Police" by a Senior Civics group in the High School of The Alexis I. DuPont Special School District, Kennett Pike, Wilmington, Delaware. The author is the Superintendent of Schools of this district, having served in that capacity for seven years.

The document gives in its introduction a description of the school, the school population, the community served and the philosophy and objectives of this high school.

The origin, inauguration of the project and personal data of the two Civics groups in the high school are discussed. The group chosen to work on the project was not hand-picked but represented a truly average group as was shown by examination of these groups.

The motion picture project evolved out of the study of a unit on "Crime." The activities participated in by the group in the study of "Crime" and its ramifications is discussed in detail together with the planning, taking and preparing the film.

A testing program was conducted, using both pre and post testing. The cost and time consumed are shown as compiled by student-kept records.

The conclusions which are arrived upon are:

1. High School students can produce a satisfactory documentary motion picture.
2. The average school with a limited budget and teachers who are not professional photographers working with a non-selected group of high school seniors, can guide to a satisfactory conclusion a project of this type.
3. Making of a motion picture was a worthwhile teaching aid as shown by satisfactory subject-matter test results, changed attitudes, personality adjustments and developments of proficiency in certain manual skills.
4. In a strictly traditional school, there are limitations which would make a project of this type practically impossible.

It is hoped that any educator who is an amateur could profit by the experiences of the investigator, the teacher and the group if he so chose to attempt a similar project.

### Principles of Baking (Flour Mixtures)

(Erpi Classroom Films, Inc., 1841 Broadway, New York, 23, New York) 11 minutes, 16mm sound. Sale price \$50 less 10% educational discount. Apply to producer for rental sources. Discussion guide will be available.

The film explains the fundamentals of baking and illustrates the methods of mixing different baked products. As the film shows a farmer inspecting wheat grains, the commentator explains that flour is the common ingredient of all baked products. By varying the other ingredients and techniques of mixing, different bread and pastry items are produced.

While a demonstrator assembles materials and equipment to illustrate the principles explained, the commentator relates that the quality of baked products depends upon the leavening agent, the manner of mixing, and the baking temperature. Yeast, a slow acting leavening agent, is used as the dough for bread is mixed. The demonstrator kneads the dough to make the mixture elastic and then sets it aside to allow the yeast to ferment. A diagram shows that the yeast, feeding on the sugar, produces carbon dioxide which forces the walls of the protein cells farther apart. To redistribute the air bubbles, the demonstrator kneads the dough a second time. After the bread has risen again, the action of the yeast is stopped by baking at a high temperature.

Baking powder which produces carbon dioxide quickly is used to make the quick breads—biscuits and muffins. Pastry flour is correctly mixed, and a diagram shows the large globules of fat which are flattened when the pastry is rolled. High temperature during the first part of the baking increases the air spaces between and around the fat globules. In this way, flaky pastry is produced.

The second part of the film explains and illustrates the importance of correct mixing. Since air is the chief leavening agent in non-butter cakes, care is used to incorporate air in the beaten egg whites and the flour is added gently to prevent the collapsing of the cells containing the air. A butter cake is mixed; and the finished product, a firm but light-textured cake, is shown as the film ends and the commentator reiterates his opening statement that the quality of baked products depends upon the leavening agent, the manner of mixing, and the baking temperature.

**Committee Appraisal:** This film and its companion "Principles of Cooking," both of which were produced in collaboration with Dr. Natalie K. Fitch, demonstrate the fundamental factors

involved in cooking and baking. Animated diagrammatic drawings show the scientific principles which underlie the procedure and which explain the "why" of recommended methods. The film may be used in classes in foods, diet and nutrition, and general science on the junior and senior high school and adult levels.

### Cadet Classification

(Bureau of Motion Pictures, Office of War Information, Washington 25, D.C.) 19 minutes, 16mm sound. Produced by U.S. Army Air Forces. Apply to distributor for a list of depositories and terms governing purchase.

Presents in detail the basic principles inherent in the classification procedure employed by aviation cadet examining boards in the selection of cadets to be trained as pilots, navigators, and bombardiers. The methods shown are those used by one particular school, but they are typical of those universally employed to assure the individual cadet's being placed in the job where he can best execute his abilities.

Complex machines that not only test abilities but also register the score are used to test coordination, finger dexterity, steadiness, reaction time, coordination, ability to adjust to variation in altitude and temperature, and ability to think and work under stress. Through physical examinations and immunization and inoculation the health of the cadets is assured.

The film ends with a dramatic portrayal of how the Board handled the case of Frank McCord who thought he wanted to be a pilot and not a bombardier. He is shown by his test score and statistics that he is better suited for training as bombardier; consequently he willingly accepts his assignment with an optimistic determination to make a good bombardier.

**Committee Appraisal:** Essentially a recruiting, pre-induction, and induction film, "Cadet Classification," shows in an interesting manner the battery of tests given aviation cadets in order to discern their aptitudes and abilities which determine their classification as bombardiers, navigators and pilots. The film succeeds in maintaining objectivity in presenting the testing program and classification of cadets while arousing one's interest in certain individual cadets and inspiring confidence in the men of the Air Forces. Should be suitable for use by aviation cadet examining boards, high school pre-induction classes, and adult groups.

### Six-Legged Saboteurs

(U. S. Department of Agriculture, Washington, D. C.) 11 minutes, 16mm, sound. Apply to producer for purchase price and rental sources.

A cartoon sequence opens the film: Adolph Anopheles, Tojo Fly, Benito Boll Weevil, and Pierre Screwworm plan the sabotage of the insect Axis on the people and crops of the United States.

As each figure promises to do millions of dollars of damage each year, the symbolic figure of Uncle Sam appears and emphasizes that their plans of havoc are a yearly reality. Uncle Sam then introduces the Chief of the Bureau of Entomology, Doctor L. O. Howard, who denounces insects as the worst enemy of mankind and points out that the destruction of crops by insects means that the work of one million men annually goes to feed these saboteurs.

(Concluded on page 132)

This monthly page of reviews is conducted for the benefit of educational film producers and users alike. The comments and criticisms of both are cordially invited.

Producers wishing to have new films reviewed on this page should write L. C. Larson, Indiana University, Bloomington, Indiana, giving details as to length, content, date on which the film was issued, basis of availability, prices, producer and distributor. They will be informed of the first open date when the Teacher Committee will review the films. The only cost to producers for the service is the cost of transporting the prints to and from Bloomington. *This Cost Must Be Borne By The Producers.*

# The World Acclaimed Film Classic On Juvenile Delinquency!

# ROAD TO LIFE

**WARM - HUMAN - AMUSING  
CONSTRUCTIVE AND  
ENTERTAINING!**  
A Brilliant Feature Motion Picture  
For Young and Old

"ONE OF THE WORLD'S GREATEST FILMS" said famed Hollywood director, King Vidor, of ROAD TO LIFE. His judgment was based on good reasons, for this dramatic story of the reclamation of homeless and wayward children in Russia after World War I, achieves that rare rich quality of the classic creation in any art: validity for all time, for all countries.

NOW, in a war-stricken world the warm, understanding, constructive story of how the former "wild boys of the road" were taught social living and industrial trades is of most timely interest for all audiences. The efforts of the social worker and teacher to arrange for a trial of the honor system and community life of training and opportunity for the "boys"; and the story itself of how the "boys" rejected temptation and became useful, honored young citizens constitute a vital, absorbing combination of fine entertainment and stimulating education.

HERE is a full-length film that helps us "see" our problem better because it is set far away — because it is an unforgettable production, compelling in its combination of effects of sound, music, songs, photography, acting, direction and intent.

Directed by  
Nicalai Ekk,  
Former Assistant to  
Meyerhold.

# March Release!

## "BOOMTOWN, D. C."

16 MM SOUND—2 REELS

Washington, the nation's pulsing heart—the peacetime governmental center of the country. But war has changed Washington's profile. Side by side with resplendent buildings are newly constructed boom houses to accommodate the hundreds of thousands of defense workers. These are the little people and big people who direct the war and run the government. See how they live—see the humdrum of the nation's busiest city—Boomtown, D.C.—an authentic record of our capital.

"BOOMTOWN, D. C." is the 4th in the

(Concluded from page 130)

Later scenes show the damage done by the more common insects—the bollweevil, the grasshopper, the screw-worm, the Colorado potato beetle, the housefly, and the most dangerous of all, the mosquito. Close-ups of each insect, the wide-spread damage done annually, the ways of controlling their spread are shown. The extent of the ravage is illustrated in terms of the war material the same amount of money could purchase.

As Uncle Sam makes a final plea for control and extinction of insects, the film closes with a scene showing the insect axis being exterminated by modern means.

**Committee Appraisal:** Through actual scenes that portray in a graphic fashion the vast amount of damage done annually by the more destructive insects the film emphasizes the importance of the control and extermination of insects. Close-ups are used advantageously to depict distinguishing characteristics of each of these pests. While the introductory sequence consisting of a cartoon delineation of insects as dictators has a popular appeal, the committee felt that this representation weakened the over-all effectiveness of the film. Teachers of agriculture, general science and biology and leaders of farm groups will find the film especially useful.

### Time

(Modern Talking Picture Service, New York) 16mm. sound, black and white, two reels, \$25 purchase price. Produced by Audio-Productions, Inc., New York City.

The film presents the history of man's measurement of time and explains the relationship of astronomy to the correct measuring of time necessary in the world of mechanical appliances, large scale productions, and vast transportation systems.

The first part of the film shows and illustrates man's early attempts at marking time—tying knots in rope, cutting notches in sticks, and marking lines on walls or surfaces. Soon, man was able to divide the day or night into periods by which all people of one group could conveniently live and work. Some of these early time-keepers were the Egyptian water-clock, King Alfred's candle, the sundial, hour glass, and Renaissance tower clocks.

Familiar situations show the passing of time—change of seasons, generations within a family, old and new civilizations. The use of animated drawings illustrates the relationship of astronomy to the correct measurement of time. Diagrams explain the difference between the solar and the sidereal day. The principle of the pendulum and its counterpart, the escapement, is shown and explained. The development of the escapement and the fine hair spring explains the reduction in size of the modern timepieces. Many early clocks and watches are shown—bulky in size and elaborate in design—in contrast to the small, compact, simple clocks and watches of today.

The film concludes by showing how modern astronomical observatories and our modern time pieces combine to schedule accurately our railroads, automatic manufacturing processes, radio broadcasting and, in fact, all of the events of our daily routine.

**Committee Appraisal:** An interesting and instructional treatment of the progress in the measurement of time and of the need for a common and accurate measurement of time. This film will be of particular interest to teachers of general science, physics, mathematics, and social studies.

## Know America Through Her Resources

(Concluded from page 109)

One special feature of this course should be especially mentioned, the work with the school library. Each week the library has carried stories of the locality being studied. These stories may be fiction or non fiction, such as historical events of the country shown, or vocational books showing the industries of the locality being shown. This work is absolutely necessary, for here is the transfer of the visual percept to the symbolic word. The librarian must know the picture that is being shown and must choose books that deal with the same subject matter as the pictures show. The retarded reading mind must find simple reading material, while the brilliant reading mind must find material suited to it. There are numerous slides that can be shown with a lantern. These add to the experience, but are not as fascinating as a movie, and the skilled teacher will not contrast the two. In fact these slides can give value when viewed in the library by holding them to the light. The stereoscopes yield still greater values in individual use. The retarded, special cases are given these further visual aids to enhance the experience and give more associations from which the word may receive its life. From this bibliography, and the accompanying visual aids, have come special reports that have been given by the pupil gifted in speaking during the auditorium discussion period. Due to the war there are many states represented in a school and here the gifted pupil steps out to make a report on the state from which he comes.

when that state is included in the zone being studied. A further coordination should be made here between the speech arts class and the report made in the auditorium.

We have taken it for granted that America is great. We know she is, but we have failed to realize that patriotism can be imitative or intellectual. Too often it has been imitative. This course hopes to make each pupil realize that America is great in her resources as well as in her military strength. The latter is well shown in the moving pictures which the government has loaned to the schools. They are exceptionally fine. In a city so close to the border the Good Neighbor films of the Government have also given a new attitude to the two races that meet daily in this school. Such pictures have been shown to the classes described in this article. They have been received with special attention. The cities of South America, Central America, and Mexico have become places where pupils in these classes have walked and observed—Buenos Aires, Rio Janeiro, Mexico City; countries, such as Argentina, Guatemala, Brazil, are familiar names and not places colored green on a map, or red. They have become places. They have become realities. Realities in mind picture, in word picture, in feelings of brotherly understanding. There is no way to measure this accomplishment arithmetically. But the three years have given us the abiding faith and conviction that these pictures will live in the minds of all the pupils, that their experience has been enlarged and that the learning process has been enhanced.

## News and

### Expanded Film Activity in State Department Reorganization

The U. S. State Department has been granted an additional \$500,000 by the House Appropriations Committee for extensive post-war motion picture operations involving reorganization of the department and the establishment of a new film division.

According to the new set-up, commercial motion pictures will be handled by the State Department's new Telecommunications Division, headed by Francis C. DeWolf. George R. Canty, picture specialist for the Department of Commerce, will be in charge of foreign marketing of commercial films.

Non-commercial films will be the concern of the newly-created motion picture and radio division of the Office of Public Information, under John M. Begg, who has been working with non-theatrical pictures for five years and was with the now-defunct division of cultural relations. This new division will act as "liaison" between the State Department and other departments in the dissemination abroad of information regarding the war effort, and in the development of cultural programs through the media of motion pictures and the radio.

### Army-Navy Incentive Film Distribution

All efforts of the OWI to release the Army and Navy industrial incentive films through regular OWI distribution channels have failed up to now. A conference was held in New York last month between Stanton Griffis, director of the OWI Motion Picture Bureau, C. R. Reagan, head of the non-theatrical division of the Bureau, and Army and Navy officials to discuss the separate and competitive distribution of war incentive films to war plants by the Army and Navy. The Army claimed that under its present distribution contract with Castle Films, Walter Gutlohn, Inc. and Modern Talking Pictures, Inc. it does not need the services of the 241 OWI 16mm. film depositories to achieve widespread circulation. (Each of the three national distributors serves 16 states and in their respective territories, each selects local distributors.) Mr. Reagan, however, urged that the Army and Navy utilize OWI depositories in addition to their other outlets "in order to achieve the best possible coverage nationally for these vitally important war films."

To promote the widest possible use of the incentive films in any given war plant district, the War Department has assigned an Army officer to take charge of film distribution in the individual Army service command areas. The officer works with the local distributor and with local war plant managers in arranging the screenings. The War Department is preparing a report on distribution of the films under the present system. It is reported that during the month of January in one area alone, 24 incentive pictures were given approximately 4,000 screenings in war plants, reaching a total audience of more than 7,000,000 or an average attendance per screening of about 200 persons.

# Notes

Arthur L. Mayer, on leave from his executive position with the War Activities Committee of the Theatrical Industry, has been appointed film adviser to the War Department to supervise the distribution of Army films. The War Department has moved its Industrial Motion Picture Branch from the Pentagon Building, Washington, to the Offices of the War Activities Committee, Room 1351, Paramount Building, New York City.

War plants desiring to exhibit incentive films produced by the Navy should write to the Industrial Incentive Division, U. S. Navy, 2118 Massachusetts Avenue, NW, Washington 25, D. C.

*Battle of the Beaches*, a swift moving film preview of our all-out invasions, is a new Navy film now ready for showings to war workers in both 16mm. and 35mm. sound. Narrated by Quentin Reynolds, it is based on actual combat scenes, many hitherto unrevealed, vividly portraying the high cost of men and material involved in storming enemy beaches. The picture traces the many amphibious operations to date that have turned the course of the war in our favor. It also shows captured German film depicting the Nazi version of the Dieppe "Dress Rehearsal".

### New WAC Theatre Releases

Official Marine Corps films of the battle of Tarawa are now being distributed to theatres through the War Activities Committee. The U. S. Marine Corps cameramen are said to have made some of the best combat films yet produced in the toughest battle in American history. Two of the camera unit lost their lives in this action. The footage was filmed in 16mm. Kodachrome and blown up to 35mm. by Technicolor for theatrical release.

Another current WAC release is *At His Side*, made especially for the Red Cross by the March of Time from footage obtained from the Signal Corps, Army Air Forces, Navy, Office of Strategic Services, newsreels, March of Time and Red Cross photographers. It shows how the work of the Red Cross contributes to the welfare and morale of our Armed Forces.

Both these subjects are being considered for OWI 16mm. distribution.

### Bureau of Mines Film Report

The free educational motion pictures of the Bureau of Mines were given almost 100,000 showings during 1943 before war training classes, Army and Navy personnel, engineering and scientific societies, schools, colleges, civic groups, and other organizations, according to a year-end report just submitted to Secretary of the Interior Harold L. Ickes by Dr. R. R. Sayers, Director of the Bureau.

The gross attendance—nearly 8,000,000 persons—was slightly under the previous year, Dr. Sayers said, but the films reached more war workers in all parts of the Nation and proved valuable for training men and women in manufacturing plants and for schooling

## Goldf New "FILMATIC" Triple-Purpose Film Slide Projector

**FORCED  
AIR COOLED**

**USED  
3 WAYS**

1. For 2 x 2 Slides
2. For Single Frame 35mm Slide-film
3. For Double Frame 35mm Slide-film

**Used By the Armed Forces  
★ SPEEDS VISUAL TRAINING**

### Advanced Features

- New Non-Rewind Design Eliminates Rewinding
- Motor Driven Forced Air Cooled
- Feed Capacity up to 300 Single Frame Pictures
- Instantly Adjustable
- Includes Manumatic Slide Carrier
- ... and other features

This new easier-to-operate projector simplifies your projection problem in war training and industrial education, *Provides clearer visibility for larger audiences.* The Filmatic is built like a professional model—yet is easily portable. Has corrected projection lens (5" f 3.5). Uses 300, 200 or 100 watt lamp. Complete with switch, cord and custom-built carrying case.

## New AIR-FLO STEREOPTON

- Forced-Air Cooled
- Takes up to 1000 Watt Lamps
- Choice of Lenses
- Pre-Focus Socket Aligns Filament on Optical Axis
- All-Steel-Welded Structure
- Built-in Tilting Device
- Fully Adjustable Bellows

**Above Items Are Available Now on Proper Priority for:**

Educational Institutions—Army and Navy—Maritime Bases—Lend-Lease—War Industries—Government Agencies—Medical Profession, etc.

Developed to meet today's needs in training centers and schools. Cooler-operating . . . for long projection distances. Shows standard 3 1/4" x 4" stereopticon slides. Has powerful but *quiet* high speed motor. Three ground and polished lens furnished. 30" long overall. Stands firmly . . . yet is conveniently portable.

When writing, please address DEPT. C

members of the armed forces in maintenance and repair work.

Bookings were made months in advance for films showing production methods, processing techniques, and the industrial utilization of such metals as aluminum, nickel, copper, lead, and steel. There was a heavy demand, too, for pictures depicting first-aid procedures. In addition to the widespread domestic distribution of the Bureau's films, some of the pictures were flown across the Atlantic for showing to aircraft production workers in England. Others were sent to South American republics through arrangements with the State Department.

The Bureau's film library, believed to be the largest and most complete of its kind in the world, had a total of nearly 9,000 reels of sound and silent films at the close of 1943. The main distributing center is the Graphic Services Section at the Bureau of Mines Experiment Station, 4800 Forbes Street, Pittsburgh, Pa. Sub-distributing centers are maintained in 18 other states. No charge is made for the loan of the films, although borrowers are required to pay transportation charges to and from the distributing centers.

**Addition to OWI Non-Theatrical Staff**

Miss E. A. Marquardt, formerly with the Bureau of Visual Instruction, Extension Division, University of Wisconsin, and more recently with the Visual Aids Branch, Training Division, Third Service Command Headquarters, Baltimore, recently joined the staff of the Non-Theatrical Division of the OWI Bureau of Motion Pictures, serving as Film Registrar and Assistant Head.

**SMPE to Meet in April**

The Society of Motion Picture Engineers will hold its 55th semi-annual technical conference at the Hotel Pennsylvania, New York, April 17, 18 and 19, instead of April 25-27, as previously scheduled. Technical sessions, following a general business session opening the conference on Monday morning, are scheduled to be held throughout the three-day meeting, with special sessions in the evening.

**Industrial Firm Institutes Film Division**

Owen Illinois Glass Company of Toledo has organized a film division to handle film activities of the organization. Manager of the new division is Harlan Hobbs, formerly with Paramount. Charles W. Bentley will have charge of the photographic end of the new department.

Walt Disney has been engaged to make an extensive survey of the company's activities that will lend themselves to the use of films to popularize them as well as merchandising the completed products of these departments. Raphael Wolff studios will also make a survey of the industrial films to be used by the company.

## Current Film News

■ **ENCYCLOPAEDIA BRITANNICA FILMS INC.** (formerly Erpi Classroom Films), 1841 Broadway, New York, produced twelve films in 1943, among them the following four films on Canada for the regional geography series, made in collaboration with Dr. J. Russell Smith of Columbia University:

**The Prairie Provinces**—covers agriculture, with especial attention to grain growing, peopling, furs, transportation, mining and commerce in the prairie provinces of Manitoba, Alberta and Saskatchewan. Includes also the Northwest Territories.

**Pacific Canada**—traces routes of discovery and exploration. Portrays the peopling of the region, with emphasis on part played by climate and by transportation. Sequences on fishing, lumbering, mining and smelting, agriculture and interdependence.

**Maritime Provinces**—shows fishing, fur farming, lumbering, farming, mining and smelting, commerce and peopling, indicating flows to and from the United States.

**The Industrial Provinces**—delineates typical activities and industries of Ontario and Quebec, the Heart of the Dominion. Shows distribution of population, and relation of region to the remainder of Canada, the United States, and world. Summarizes products and imports.

Other areas in which new films have been produced are:

**Home Economics**—*Fundamentals of Diet, Principles of Baking* (Flour Mixtures); *Principles of Cooking* (Meats and Vegetables).

**Physics**—*Elements of Electrical Circuits, Vacuum Tubes, Receiving Radio Messages*.

**Biology**—*Care of the Feet, Common Animals of the Woods*.

■ **BELL & HOWELL COMPANY**, 1801 Larchmont Ave., Chicago, report the acquisition of the following two Universal feature pictures for approved non-theatrical audiences:

**Between Us Girls**—a modern comedy concerning a young stage star who masquerades as a twelve-year-old to help her mother win the man she loves. The cast includes Diana Barrymore, Kay Francis, Robert Cummings and John Boles.

**Eagle Squadron**—in which real combat photography made over England, France and the Channel serves as a background for a romantic drama of men and women at war.

Also released by Bell & Howell is:

**Gateway North**—a silent reel in color produced by Karl Robinson, showing the initial stages of the new roadway through British Columbia toward Alaska.

■ **PICTORIAL FILMS INC.**, R.K.O. Building, New York, is releasing this month the fourth subject in its series of thirteen films on *This is America*, on which they have exclusive 16mm rights. Title of the current release is:

**Boomtown, D. C.**—the story of the nation's busiest city, our capital, and of the big and little people in Washington who direct the war and run the government. Side by side with resplendent buildings are seen newly constructed boom houses to accommodate the hundreds of thousands of defense workers.

Previously released films in this series are:

**Private Smith of the U. S. A.**—the dramatic story of the transformation of Mr. Average Citizen when he sheds his "civies" for khaki, and his experiences in army life.

**Women at Arms**—a tribute to American women in war work, to those in defense plants as well as to those in

such organizations as the WACS, WAVES, AWVA, and OCD.

**Army Chaplain**—an inspiring account of the work of these heroic men of all creeds, showing how this great moral army is trained to perform their services on the front line, under the enemy's fire.

■ **DEVRY FILMS & LABORATORIES**, a subsidiary of DeVry Corporation, 1111 Armitage Ave., Chicago, has been named a depository for Office of War Information films, which are now available. It is also announced that the 16mm. film-on-sound edition of the

British war epic *Desert Victory* is available through DeVry Films & Laboratories. According to Lt. Col. David MacDonald, under whose direction this document was filmed, 95% of its footage was made with DeVry 35 mm. motion picture cameras.

■ **BRITISH INFORMATION SERVICES**, 30 Rockefeller Plaza, New York, have announced that the first joint feature production of British and American army film units, recording the Tunisian campaign, will soon be released in the United States by their exchanges and the Office of War Information, through M-G-M, under the title:

**Tunisian Victory**—75 minutes running time—a successor to last year's notable war film, *Desert Victory*. The new picture begins with the African landings and ends with the Germans thrown out of Tunisia. It reports the joint action of British and American troops through six months of desperate fighting.

Produced by the British Army Film Unit, under Colonel Hugh Stewart, and the United States Army Signal Corps, under Colonel Frank Capra, the film cost the lives of many cameramen. Except for a few scenes, *Tunisian Victory* is made up of "combat footage." Like *Desert Victory* it reproduces the real thing. There are also sequences from captured film which provide glimpses of Rommel and Kesselring. In contrast to the worried Nazi leaders, is shown the happy and historic visit of Churchill and Roosevelt at Casablanca, and their meetings with the confident British and American generals. There is also a sequence of the German surrender which shows thousands of German prisoners surrendering with their hands in the air or being checked into prison camps by their captors.

■ **HOFFBERG PRODUCTIONS, INC.**, 630 Ninth Avenue, New York, have secured 16mm and 35mm prints of the latest documentaries and film shots of the Polish Army and Navy, imported direct from the field of action by the Polish Information Center. Among them are the following titles:

**Poland Forever**—2 reels—depicting the pleasant pre-war Poland, its invasion, and now—the armed forces of Free Poland fighting back.

**Scottish Majurka**—2 reels in technicolor—activities of the Polish Army in Scotland, training for the invasion of the continent with allied armies. Presents festivals, dances and typical Polish music.

**The Poles Weigh Anchor**—1 reel—life of a Polish destroyer in the service of the allies.

**The Price of Freedom**—3 reels—story of the development of the port Gdynia, illustrating Poland's progress in the two decades between the two wars.

**The Shortest Route**—1 reel—a vision of the day of Poland's liberation when her sons serving with the paratroop divisions will return home.

# The most conveniently adjustable Projection Screen ever made!

### Only Radiant Can Offer You All These Important Features:

For quick, convenient setting up and easy adjustment to exact size and position—Radiant Screens offer an exclusive combination of these features:

**AUTOMATIC CLUTCH** A sure acting arrangement that permits instantaneous raising and lowering without the necessity of manipulating screws and bolts. So simple and easy to operate a child can use it.

**TRIPOD RELEASE** for opening or closing tripod legs quickly. Legs lock into position without set screws or plungers. Light pressure on convenient lever closes legs instantaneously.

**Auto-LOCK** For raising or lowering center extension rod instantly. No set screws, spring plungers or other hand operated devices.

**CONVERTIBLE FROM SQUARE TO OBLONG**—Radiant square-sized screens are convertible to oblong by merely raising screen to plainly marked position.

### PLUS Other Radiant Features:

Radiant Screens can be instantly raised or lowered to *any* desired position (not just 2 or 3 intermediate positions) without adjusting set screws or plungers. Radiant Screens have the famous "Hy-Flect" Glass Beaded Surface and extra strong square tubing. All metal parts are fully protected against corrosion.

### Can You Get Radiant Screens Now?

The answer is "yes". The complete Radiant line of metal screens is available in limited quantities to essential users who obtain WPB approval of their applications. Others may obtain their choice of the full line of Radiant Non-Metal Screens. For complete details write today for new Radiant Catalog—just off the press!

■ **THE NATIONAL FILM BOARD OF CANADA**, 84 E. Randolph St., Chicago, announces the availability of the first three films in its new *Knife and Fork Series* dealing with wartime nutrition problems. These films, produced with the sponsorship of the Canadian Wartime Prices and Trade Board, were planned specifically to meet the needs of urban women and provide a practical guide to wartime housekeeping. Each is 16mm sound and runs 18 minutes. The three completed subjects are:

■ **The Main Dish**—discusses conservation needs and economic food planning in regard to wisely chosen cuts of meats. Various cooking methods are demon-

strated to help housewives prepare appetizing meals from cheaper cuts.

■ **Vitamin-Wise**—in which the vitamin categories of the main fresh vegetables and fruits are explained. The film shows proper cooking methods to obtain the maximum food value, and conservation of both food and fuel.

■ **Coupon Value**—a practical demonstration of how best to cut down home food consumption to insure equal food distribution. It explains the Coupon Value Chart which aids housewives in the selection and preparation of meat.

Additional films in this series are in preparation and will be available for purchase within the next few months.

■ **OFFICE OF WAR INFORMATION**, Bureau of Motion Pictures, Washington, D. C., have received 16mm prints of four National Film Board of Canada productions which will be shipped to OWI distributors. These subjects are:

■ **Handle with Care**—a 2-reel documentation of a Canadian explosives plant. The stages of manufacture are depicted with the necessity for eternal vigilance emphasized.

■ **Siely, Key to Victory**—the record of the Canadian First Division in the Sicilian campaign. Shots of war workers at home are used to demonstrate the essential link between war and home fronts.

■ **New Soldiers Are Tough**—an example of the new type of "tough" war films, presenting the new type of training and psychology of attack.

■ **Pincers on Japan** (Canadian title, "Road to Tokyo")—dealing with Canada's place in the strategy of the Pacific.

■ **Suggestion Box**—a 1-reel industrial incentive film for war plant workers—is another recent OWI release, prints of which were donated by the War Production Board. It shows how production has been greatly increased in plants by ideas of the workers.

Other films deposited with the OWI are *The Dutch Tradition*, a 3-reel subject released by The Netherlands Information Bureau, and *Desert Victory*, produced by the British Information Services.

■ **WALTER O. GUTLOHN, INC.**, 25 West 45th Street, New York City, has opened a branch office at 19 LaSalle Street, Chicago, Illinois. Marcia Shiro, who has been handling the Photographic Dealer Department of the Gutlohn organization, has been appointed to take charge of the new office which will directly service Gutlohn customers in the area. With their Chicago branch, Walter O. Gutlohn, Inc. are now in a position to facilitate film deliveries to midwest schools and the photographic trade, as well as provide a greater degree of personalized service.

Recent Gutlohn 16mm releases include the two Hollywood productions:

■ **My Favorite Spy**—an RKO feature presenting Kay Kyser in a gay, tuneful comedy. Late for his own wedding, Kay reaches the church to find that Uncle Sam has called him to the colors and he must report that very day. He

becomes involved in the "Intelligence" Service amid a daze of girls and undercover plots.

■ **Pardon My Sarong**—a riotous Abbott and Costello comedy produced by Universal.

■ **BUREAU OF MINES EXPERIMENT STATION**, 4800 Forbes St., Pittsburgh, Pa., has completed five new instructional 16 mm. sound films depicting some of the manufacturing processes used in the fabrication of aluminum and aluminum alloys. These films constitute a series of *How to Form Aluminum* pictures, but each is complete in itself. Titles of the separate subjects are:

■ **General Sheet Metal Practice** (21 min.)

■ **Blanking and Piercing** (16 min.)

■ **Tube and Shape Bending** (14 min.)

■ **Drawing, Stretching, and Stamping** (22 min.)

■ **Spinning** (17 min.)

Applications for free short-term loans of these five films should state specifically that the borrower is equipped to show sound films.

■ **BRANDON FILMS INC.**, 1600 Broadway, New York, have re-issued in 16mm sound the world famous feature film story of the re-education of the former "wild boys of the road," called:

■ **Road to Life**—95 min.—classic juvenile delinquency film, based on the actual story of the work done by social workers and teachers in Soviet Russia during the early 1920's. Although the setting is the post-World War I period of economic restoration in Soviet Russia, the warm, understanding approach, the universality of the subject, and the English super-imposed titles make this film of special interest. It tells the dramatic and often amusing story of the steps taken to rehabilitate the delinquents by way of personal attention, vocational guidance, honor system, self-discipline, and productive work in a cooperative. How the "wild boys" learn a trade and become useful, happy citizens is a source of inspiration to teachers, social workers, parents, and children.

■ **OFFICIAL FILMS, INC.**, 625 Madison Ave., New York 22, have compiled a valuable historical reel featuring three recent important events, in Volume I of their 1944 News Thrills, namely:

■ **Roosevelt-Stalin-Churchill Meeting**—showing the first get-together of the "Big Three" at the Teheran conference to map the campaign against the enemy.

■ **Roosevelt - Churchill - Chiang Kai-shek in Cairo**—where cooperative Anglo-American-Chinese strategy against the Japanese took concrete form.

■ **Marines Take Tarawa**—a visual record of the fierce fighting for the Jap-held isuanl.

### Women's Athletics Section Films

For several years the Visual Aids Committee of the National Section of Women's Athletics has had a rental library of films on the techniques of sports including archery, hockey, swimming, softball and tennis. These films have been distributed through their Washington, D. C. office. Due to a reduced budget for secretarial service, the Washington office no longer can afford the time required for distributing and servicing films, and have turned their films over to the Bell and Howell Company, Chicago for future distribution.

The Visual Aids Committee of the N.S.W.A. will continue to function through the previewing of teaching films in physical education, appraising and listing them and telling how and where they may be obtained. The chairman, or the committee, will publish articles in the *Journal of Health and Physical Education* from time to time stating reliable sources of information on films for school use and on other visual aids, such as, posters, charts, lantern slides and film strips. For information on Visual Aids please address: Frederica Bernhard, Chairman, University of California, Berkeley 4, California.

### School-Made Motion Pictures

(Concluded from page 124)

the center of the film. This can be accomplished in several ways.

1. If yours is a magazine loading type of camera this problem need not bother you. You can buy or borrow a device to be inserted into the camera before taking pictures. This device shows you exactly what you get if you leave the camera in the same position with the film magazine as you took with the parallax correcting device.

2. If your camera contains a ground glass focusing device I am sure your camera can assist you in your calculations.

3. If your camera does not come under either of the headings above you may be able, if you look around hard enough, to obtain a reflex focusing finder. Should you be unsuccessful, you can save your thirty or more dollars, and do what I did.

Take a rolled steel bar,  $3\frac{1}{2} \times 1\frac{1}{2} \times \frac{3}{8}$  inches. In the center of that bar drill a hole of the same diameter as the tripod hole in the camera. This hole is to receive a flat headed bolt having the same pitch as the tripod screw. Now drill two holes  $\frac{5}{8}$  of an inch away from the center—one hole on each side. These holes should be threaded to take the tripod screw. All this can be done in the machine shop of the school.

For close-up filming, bolt the bar through its center to the camera. Attach to the tripod screw the left hole of the bar. Sight through the viewfinder to get the object in the center. Where the camera meets the bar at right angles place a scratch line across the bar. Keeping the tripod in the same position, remove the bar from the tripod screw, and this time attach to the hole on the right, making sure that the line formed at the conjunction of the camera and bar is parallel to the first scratched line. For future use it's advisable to mark the second line. This time as you sight through the viewfinder the object will be off center to the right but correct for the camera lens.

Some cameras have on the front element of their viewfinders etched markings for close-ups of two and six feet. Other short distances not marked have to be guessed at. In order to eliminate possibilities of error I find that the metal bar is more reliable than my eyesight. As for cameras whose viewfinders are situated above the lenses, the technique for parallax correction should be practically similar—with one change. The metal bar should be built like a frame, the height of which should equal the vertical distance between the centers of lens and viewfinder.

D. S.

### George Zehrung Leaves Y.M.C.A. Bureau

(Concluded from page 137)

sons engaged in the non-theatrical and educational field. Mr. Harry A. Kapit, President of Walter O. Gutlohn, Inc., states that "Mr. Zehrung will have one of the nation's most extensive 16mm film libraries at his command, embracing more than 3000 entertainment and educational subjects." George Zehrung's many friends throughout the country will rejoice that the change assures his continued activity in the field where he belongs.

The National Council has named Mr. J. Raymond Bingham as successor to Mr. Zehrung. Mr. Bingham comes to the Bureau from the program Directorship of the YMCA-USO service, with previous experience in two large city YMCA's. Under his direction, with Mr. A. L. Frederick as associate director, the Bureau will continue to stimulate the widest possible use of the best films available from all sources.

## UNIVERSAL PICTURES COMPANY, INC.

Rockefeller Center New York, N. Y.  
CIRCLE 7-7100

# Among the Producers

## Elsie Cross Kodachromes

An important source for 2 x 2 Kodachrome slides of exceptional quality is the collection of fine originals made by Elsie Cross of San Francisco. They are now on a production basis, organized in subject units, with full descriptive matter for teacher use accompanying the slides. School systems, Museums, and College Departments are enthusiastic at first sight of this material.

After years of travel, in concert bureau management and on the lecture platform, Miss Cross found her paramount interest in photography. Repeated journeys through Canada, the United States and Central America yielded many motion picture films of notable quality, but gradually Miss Cross came to concentrate on the 2 x 2 Kodachrome slide. Her choice collection, after elimination of all but the finest negatives, offers some 600 slides on Mexico, 100 on Guatemala, and some 75 (after omission of Communist propaganda) on the famous Diego Rivera murals, including a portrait of the artist himself.

Having seen Miss Cross' motion pictures on Mexico, the Mexican Government extended her special permission to photograph, for the first time, such subjects as the treasure of the Cathedral of Mexico, rare Museum pieces of pottery, jewelry and sculpture, and the recent findings in the Tula excavations. A complete Archaeology set of 275 Kodachromes on Mexico and Yucatan—including Uxmal, Old Chichen, Chichen-Itza, Teotihuacan, The Citadel, Tenayuca, Xochimilco, Monte Alban, the Aztec peoples, etc.—will be found invaluable to Museums and College Departments especially. For full information write direct to Miss Elsie Cross, 1305 Lombard St., San Francisco, California.

## Ampro Plant Expanded

The Ampro plant with its completed addition is shown below. New equipment is already in operation and additional workers are doing their bit on the production front.

After the war, this new addition will house the office staff and will be one of the most modern attractive offices in the Middle West.

## Coronet Picture Story Service Extended

The slidefilms and reprints of the *Coronet* Picture Stories which were made available last September through the Society for Visual Education, Inc., will be extended into a total series of sixteen subjects—eight for the current school year and eight more for the next school year. This service, which is sponsored by *Coronet* as a contribution to the visual training programs of schools, is now used by thousands of projector owners among schools, churches and other organizations. It is also used regularly in many units of the Armed Forces.

Under the terms of this service, the principal Picture Story in each issue of *Coronet* is reproduced on slidefilms. In addition, the same Picture Stories are available in the form of reprints for those who do not have projectors or who may wish to have copies for individual students. The entire series of eight slidefilms during one school year costs only \$2.00 including one subject in full natural color. The reprints, in lots of twenty-five or more each month, are furnished at 1c each—\$2.00 for twenty-five of each for a period of eight months.

The releases to date have included "Through the Periscope"—a story of submarine warfare; "China Fights Back" by Madame Chiang Kai-Shek; "Queens Never Die"—the story of the S. S. Normandie; "Anchors Aweigh"—a picture of the U. S. Navy, in Technicolor; and "A World and Two Wars"—which compares 1917 with 1944. The next two subjects will be "Dedication" and "Panic."

The subjects for this school year extend through April. The series for 1944-45 will start in early October, 1944, and extend through May, 1945. Those who may wish to subscribe to the service for both years may do so at any time by paying \$4.00. All back slidefilm releases will be mailed upon receipt of the order and the others will be delivered according to schedule.

Subscriptions to the service or requests for additional information should be sent to the Society for Visual Education, Inc., 100 East Ohio Street, Chicago 11, Illinois.

## Encyclopaedia Britannica Films Elects Directors

Fifteen of the nation's prominent educators, editors and business leaders were elected members of the Board of Directors of Encyclopaedia Britannica Films Inc., formerly known as Erpi Classroom Films which recently was purchased by Encyclopaedia Britannica. Eight of the directors already serve in a similar capacity with Encyclopaedia Britannica. The new chairman of the board of Encyclopaedia Britannica Films Inc. is William B. Benton, Vice-president University of Chicago, who also occupies that post on the Britannica board.

Also elected to the board is Chester Powles, OPA Administrator, Marshall Field, publisher, Wallace K. Harrison, architect, Paul G. Hoffman, President of Studebaker Corp., Ernest Hopkins, President of Dartmouth College, Robert M. Hutchins, President University of Chicago, Henry R. Luce, Editor of Time and Life, E. H. Powell, President of Encyclopaedia Britannica, Peardsley Ruml, Treasurer of R. H. Macy Co., E. E. Shumaker, President of Encyclopaedia Britannica Films Inc., M. Lincoln Schuster, Simon & Schuster, Harry Scherman, President of Book of the Month Club, John Stuart, Chairman of Quaker Co. and Wayne C. Taylor, Under-Secretary of Commerce.

## Motion Pictures Not for Theatres

(Continued from page 117)

gram, which Fox had launched, arose for his decision, he declared that the department would be continued only if it could be demonstrated that school pictures so made would be of as much benefit as the advocates of the idea claimed, and if it might be proved, also, that they would be welcomed by boards of education. However, he was not just waiting to be shown. He would provide facilities for making the test.

In beginning any educational film program it has manifestly been wise to use the existing or aroused interest of persons whose influence may help to achieve the purpose. It reduces possible general resistance to the idea and makes accomplishment correspondingly easier. In all events, that is the approved executive method. The rare exceptions have been provided by creative artists such as F. Percy Smith and George E. Stone, who felt inner compulsions to express themselves along particular lines regardless of popular acceptance. Of course, Harley Clarke's genius was of the executive order. In the case of his S.V.E. he had started with a plan which, in one movement, had drawn the attention and engaged the participation of educational leaders throughout the nation. He now made the same sort of approach in different circumstances but to the same sensational effect. And the announcement of it came not from the offices of Fox Films, but from the office of the President of the United States.

(To be Continued)

# What happens when your hat comes down?

**S**OMEDAY, a group of grim-faced men will walk stiffly into a room, sit down at a table, sign a piece of paper—and the War will be over.

That'll be quite a day. It doesn't take much imagination to picture the way the hats will be tossed into the air all over America on *that* day.

But what about the day after?

What happens when the tumult and the shouting have died, and all of us turn back to the job of actually making this country the wonderful place we've dreamed it would be?

What happens to you "after the War?"

No man knows just what's going to happen then. But we know one thing that must *not* happen:

We must *not* have a postwar America fumbling to restore an out-of-gear economy, staggering under a burden of idle factories and idle men, wracked with internal dissension and stricken with poverty and want.

We must *not* have breadlines and vacant farms and jobless, tired men in Army overcoats tramping city streets.

*That is why we must buy War Bonds—now.*

For every time you buy a Bond, you not only help finance the War. You help to build up a vast reserve of postwar buying power. Buying power that can mean millions of postwar jobs making billions of dollars' worth of postwar goods and a healthy, prosperous, strong America in which there'll be a richer, happier living for every one of us.

To protect your Country, your family, and your job after the War—*buy War Bonds now!*

# for Perfect Projection . . .

## use this remarkable New RADIANT Screen Finder

Here's a practical new SLIDE RULE that every user of motion pictures, slide films, slides or opaque projectors urgently needs. Enables user to combine proper equipment and obtain maximum effectiveness from all types of projected visual aids. Shows at a glance:

1. The proper screen size for each distance between screen and projector with a given lens.
2. The proper screen model to select.
3. The proper distance between screen and projector to obtain any desired size of picture.
4. The proper lens to use to obtain perfect results for each distance.

Visual authorities who have seen this Radiant Screen Finder are enthusiastic about its ability. Easy to read—simple to operate. Answers all "movie" questions on one side—all "still" questions on the other side. Durable and compact—fits into the vest pocket. Available from your visual equipment supplier. If he cannot supply you—send us his name and only 50c to cover actual cost, including handling and mailing—and a Screen Finder will be mailed to you direct.

**IMMEDIATE DELIVERY**  
on Radiant Metal Screens

Here's good news! Schools may now again obtain RADIANT Metal Screens—without red tape. You can get immediate delivery under your M.R.O. rating.

Forms No. 1319 are no longer necessary. Order today!

# THE TEACHING AID OF TOMORROW ... IS AVAILABLE TO YOU TODAY!

112-Page  
Teacher's Manual

## ECONOMIC AND PLACE GEOGRAPHY FOR INTERMEDIATE GRADES

★ FILMSETS value and utility are increased many-fold by the 112-page Teachers Manual with its 672 carefully selected illustrations from the films. Each 2-page spread in this manual is a lesson outline—a quick, convenient supplement to introduction and review of Textbook or lesson subjects. Manual does not dictate how lessons are to be taught as that is the task of the teacher. To FILMSETS purchasers is available an attractive metal self-humidifying film cabinet, each drawer built to house and preserve 12 films.

★ FILMSETS 22 economic subjects follow: Old Fashioned Farm . . . A City Home . . . Wheat and Bread . . . Milk . . . Fish . . . Meat Animals . . . Fruit . . . Truck and Poultry Farm . . . Coffee and Sugar . . . Tea—Rice—Coconuts . . . Rubber . . . Growing Fibers . . . Textiles . . . Leather . . . Lumber . . . Clay and Stone . . . Peat and Coal . . . Iron and Steel . . . Petroleum . . . Watersheds and Power . . . Transportation and Cities . . . Mass Production.

★ FILMSETS 26 regional subjects follow: Zones . . . Canada . . . Alaska and Eskimos . . . Atlantic Coast . . . Mississippi Basin . . . Rocky Mountains . . . Pacific Coast . . . Mexico and Central America . . . West Indies and Panama . . . Andes and Pampas . . . Amazon . . . British Isles . . . Lowlands of Europe . . . Mountains of Europe . . . Plains of Europe . . . Russia . . . Mediterranean Basin . . . North Africa . . . Central Africa . . . Desert . . . South of the Himalayas . . . North of the Himalayas . . . China . . . Japan . . . Pacific Islands . . . Australia.

★ In building FILMSETS three requirements were made of every scene accepted: (1) accuracy and authority, (2) photographic quality, (3) correlation with lesson theme.

Enjoy a rich experience in projected (visual) classroom teaching with FILMSETS—200-ft., 16mm silent films that help teachers enhance classroom interest, develop thinking analysis on the part of the students and promote constructive classroom discussion. FILMSETS are the only direct classroom teaching films available to intermediate elementary grades that thoroughly cover the entire course of study in one major field. FILMSETS give you the *Teaching Aid of Tomorrow* interestingly and accurately—currently revised—adequately to present one of today's most important lesson subjects. Write today for details about FILMSETS that took more than five years to produce at a cost of \$100,000.00—and that are available to you at the surprisingly low price of \$12.00 per reel. Buy as many reels as you wish.

**FREE PREVIEW** will convince you. Your name and address on your school letterhead brings you two FILMSETS and lesson manual. Use these for 10 days. No obligation to buy.

FILMSETS were planned, produced and captioned by educators who knew the teacher's problem and the student's need. They have the endorsement of outstanding men in the educational field. They are particularly applicable to today's global teaching problems—important both to introduction and review of lesson subjects. FILMSETS are immediately available. The time to use them is now. Write today for 10-day preview of films and teachers manual. Address FILMSETS, INC., 1956 North Seminary Avenue, Chicago 14, Illinois.

FILMSETS is affiliated with DeVRY Corporation

Make PHYSICS classes  
 More Interesting—More Effective  
 By using the  
**KEYSTONE**  
 PHYSICS SLIDES and REVISED MANUAL

Four Manuals in One

- The Fundamentals of MACHINES
- The Fundamentals of SOUND
- The Fundamentals of LIGHT
- The Fundamentals of ELECTRICITY

To assist in the more effective illustration of problems and theory of Physics, Keystone View Company offers a visual presentation method employing carefully prepared slides and a completely revised and enlarged manual—really four manuals in one.

Through the use of this well-planned instruction system, student attention is focused on the material presented in the slides; therefore a more complete understanding of the subject is acquired.

Developed by war needs for faster, more effective training of students in basic Physics, this improved method will prove invaluable for better teaching in peacetime. It should be in YOUR school.

Write today for complete information.

## Training for War—and Peace!

Visual education techniques have helped train millions for war in less time. This vast program of mass military training has valuable lessons for our schools which will definitely aid in making teaching more effective! ★ The war program has helped Ampro engineers produce even more efficient 16mm. projectors. Today Ampro units are going 100% into the war effort. Soon—these improved Ampro projectors will be available for peacetime education. Write for latest Ampro Catalog of 8mm, silent and 16mm, silent and sound projectors.

# AMPRO

AMPRO CORPORATION • CHICAGO 18, ILLINOIS

• PRECISION CINÉ EQUIPMENT

Scene is one of the Curtiss-Wright Airplane Division classrooms for training U. S. Army ground crews.

# Visual Training dons olive drab

How to take a fighting plane apart and put it together again—how to “keep ‘em flying”—how to combat enemy tactics—how to win this war quickly—is the problem!

Speed in imparting a clear understanding to millions of fighting men—millions of civilian defense workers—is attained best by projection methods. Dramatically, they magnify and project charts, drawings, photographs and detailed close-ups. The student can retain the graphic picture better than the

words of the instructor. Seeing becomes knowing how. Knowing how is the answer!

## THIS NEW RCA **16 MM.** SOUND PICTURE PROJECTOR

- In many branches of the armed services, the RCA 16mm. projector is proving highly satisfactory both overseas and in the United States.
- The remarkable new features that make it such an outstanding performer under the trying conditions and unusual strains of wartime service are the features that will make it the "ideal" projector for use in schools after Victory.
- That's why we urge you, now, to be sure to see the new RCA projector before you choose any 16mm. sound projector for post-war service in your school.

# SUPERBLY SUITED TO SCHOOL USE!

**New features of this RCA 16mm. projector mean better projection, easier operation, extra ruggedness**

**F**OR example, the new *Constant-Tension Take-Up* (illustration at left shows its compactness and simplicity) is one of the many reasons why you'll want the RCA projector when it becomes available after Victory.

This new take-up is so smooth in action—so dependable—so trouble-free—that it stands far ahead of the field. Its smooth performance means:

**No jerks or tugs  
No pulled splices**

**No broken belts  
No film damage  
No film piled up on the floor**

Other important advances in RCA projector design include: a new removable gate which makes for easy cleaning; single-point lubrication; built-in amplifier; single-side operation; low mechanical noise; improved rotary-stabilizer for high-stability sound; efficient ventilation, which eliminates hot-spots at the top of the projector.

CAMDEN, N. J.

# Post War Implications for Education in the Audio-Visual Programs of Our Armed Services

A notable article, finely emphasizing the tremendous values of war-time procedures for visual teaching in the post-war period.

**PAUL WENDT,**  
 Director of Visual Education  
 University of Minnesota

**D**URING the past three years there has been an unprecedented growth in the production and use of audio-visual aids by the armed services. This development is great no matter by what dimensions it is measured; whether we consider the thousands of training films produced, the millions of feet of raw film consumed, the thousands of men engaged in the production of visual aids of all types and the high quality of these visual aids, or the thousands of showings of training films every day by the training officers using visual aids. Just the quantitative expanse of this development is hard to grasp from the mere figures.

But audio-visual aids have been used intensively before although on a smaller scale. Is there anything really new in these programs of the armed services? As the result of a recent tour of Army and Navy centers for the University of Minnesota, I am convinced that there is. In the planning and utilization of audio-visual aids, as well as in the invention of new devices the armed services have made a unique contribution to audio-visual education in this country.

Illustrated lecture in mess hall.

(U. S. Navy Official Photo)

## Planning the Production of Visual Aids

In the production of visual aids the basic person involved is the technician who has experience in working in the medium. In motion pictures for example, this is the motion picture producer; in charts, the artist. It is axiomatic that someone with this type of experience is necessary in all productions. Next most important is the subject matter specialist. Those of us who have had experience in producing teaching films know the great contribution that can be made by the subject matter specialist. Whenever a motion picture producer has had to outline the content of a teaching film by himself he has usually got into hot water. As a result all intelligent production of visual aids today is

(Left) A typical Navy Training Aid

(Right) Training in tracer control of anti-aircraft gunnery with the new Mark I Trainer.

(U. S. Navy Official Photos)

(Left) A Seamanship Laboratory. (Right) Dummy flag hoist and mechanical code sender used in Communication class.

done with the help of a subject matter specialist. In production of visual aids in the armed services this is the unbroken rule. Production always originates from some branch of the service where instructors in their teaching have felt the definite need of a visual aid. Sometimes, as in the Navy, the branch requesting the visual aid supplies the subject matter specialist. Sometimes he is selected from another source. But visual aids in the armed services are never made without him.

In some production a still more enlightened step has been taken. An educator is assigned to the project to guide the producer's presentation of the content along effective educational lines. This is a real innovation, especially in the making of educational films. The previous rare occasions when educational principles have been used in making teaching films usually occurred when a teacher made a film himself. Then the obvious difficulty arose that while he knew more than commercial producers about teaching, the producer of school-made movies usually had to learn film production methods the hard way. By giving the producer-subject matter specialist-educator trio real recognition the armed services have made a valuable contribution to the effective planning of audio-visual aids.

There are other interesting developments in the planning of visual aids. For years there has been a school of thought opposed to the use of humor in teaching aids. In answer to this criticism some of the visual aids produced by the armed services make use of humor in a subtle and most effective way. Walt Disney's organization, after buckling down and learning how to make teaching films, has used its talent and experience to allow the natural humor in a teaching subject to appear in the teaching film. They have refuted the belief that sound pedagogical principles and motivating humor cannot be combined. However, this use of humor in both film and non-photographic visual aids has again aroused a controversy which is likely to remain the inheritance of the post-war educator.

The use of color, especially in the non-photographic training aids, has made a distinct contribution to the effectiveness of teaching. No one who has seen Army and Navy training charts has failed to be impressed with their use of color contrast as a teaching device.

Color has also been used on models, mock-ups, and cutaways. The subtle and brilliant color designs used show that the armed services are employing here first rate artists with imagination and originality enough to design visual aids that will do the best teaching job in the shortest possible time.

#### Utilization of Training Aids

Every visual educator has known for years that the most effective use of a visual aid requires intelligent preparation of the class before the aid is used and that an immediate follow up after the showing is essential. Yet there was a wide gap between our theory and our practice. It remained for the armed services to put into practice on a nation-wide scale what we have always known to be the best methods of utilization. Besides the many officers who take care of the mechanics of ordering and providing audio-visual aids there have been hundreds of officers whose sole concern is the proper utilization of the training aids provided. Their duty is to put into practice those simple rules about the use of visual aids which comparatively few civilian teachers have observed. They have been assisted by specific visual aids made for the improvement of utilization, such as the Army film, *Military Training*, and the Navy film, *Tips For Teachers*. In these films military instructors are specifically directed to make the utmost use of training aids and how to use them intelligently.

A worthwhile contribution to better utilization is the integration of training films and training film strips on the same subject. Occasionally these have been used together before, but never to any degree approaching the present extent. The armed services and the Office of Education have produced whole sets of films and film strips to be used together. In some cases the training film can be used at the beginning of a unit to present an overview of the subject. The frames of the film strip are then projected and discussed in detail. These frames usually cover the important step of the process or operation and the bulk of the teaching is accomplished during this showing. Finally the training film is shown again to tie the separate steps into a unified whole.

### New Devices

As in industry, the war has brought extra pressure to bear on the invention of new devices in the audio-visual field in order to shorten the war by accelerating learning. We may list under this category the final development of voice reflectors (for training language groups), three dimensional projected slides, and a great variety of ingenious mechanical training aids such as gunnery trainers. Mention should also be made of the extensive and elaborate models devised by Norman Bel Geddes.

### Implications for Post-War Education

Too many administrators are trying to dismiss the achievements in audio-visual education by the armed forces with the answer, "Yes, but of course the Army and Navy have had the use of unlimited funds, and so their achievements do not apply to us poor educators." I cannot agree with this point of view. I am sure the armed services have made distinct contributions to audio-visual education which will have a real and dynamic effect upon post-war education.

In the first place we have had a demonstration that when generous funds are supplied for visual aids their use increases almost by geometric progression. Sometimes in the past it has been impossible to prove that the use of visual aids would increase beyond direct proportion to the increase in the budget. Now we have had a demonstration on a grand scale that this is true. Only a war could have provided the funds for such a complete demonstration. Certainly we won't have to argue that side of the case any more with budget directors.

The Army and Navy programs have trained hundreds of officers and civilians in the production of teaching films, projected photographic aids, and non-photographic aids. The Service men so trained are not all likely to step out of this profession after the war. Certainly many commercial companies have definite plans now for the production of visual aids in peacetimes. It would be very surprising, for example, if the educational organization that Disney has built up should be completely disbanded after the armistice. As

a result of all these rival companies, competition will be keener, more teaching aids will be produced, and the quality will probably be better than before the war.

After the war we will know much more about the educational planning of visual aids than we did before. In the early days of making training films when educational supervisors were assigned to production, many were amazed to find that there had been few applications of principles of teaching methods or of educational psychology to the making of teaching films. They proceeded to make these applications. For instance, film producers, of course, have long known that a film usually starts with "an establishing" shot. But now we have a reason for this practice from the educator and recognize that it follows the educational principle of first presenting a subject as a whole before breaking it down into its parts.

A better example of the application of educational psychology to the field is the use together of film strips and motion pictures on the same subject, each making its unique contribution to the teaching. The use of a film strip to teach detailed parts of a subject which has already been presented by a training film is nothing more or less than an example of the application to training aids of the principle of a differentiation in educational psychology. Thus the presentation of the whole is followed by differentiation of the parts of the problem. Then the following of this use of the film strip with a second showing of the training film illustrates a clear case of integrating the parts into a unified whole again. From such widely-followed experiments we will have learned more about the planning of teaching aids after the war than ever before. We will not have to cover this ground again.

Nor should there be any question after the war but that there is a place in teaching aids for the skillful, imaginative, and the restrained use of humor. In the past we have had commercial teaching film producers who had vast experience in the use of humor but did not understand teaching. On the other hand we have had producers of teaching films who knew education and who understood the importance of motivation in teaching films but whose lack of experience in the use

of humor frightened them away from it. In the war program these two groups have been forced to work together even though they may have been at odds with each other. The progress they have made in discovering the proper subtle use of humor in teaching films will be an example to post-war producers. Similarly the use of color has become almost an essential to charts, graphs, and posters. Black and white materials are going to seem more and more out of date. Color has a true place as a motivating factor, and its ability to help in differentiation is unquestioned.

The vast utilization program of the armed services will have many results. American colleges are now preparing to receive millions of soldiers returning to school. But these men have been trained intensively with audio-visual aids. They know their value in teaching. They are not likely to take kindly to the straight unmitigated lecture methods. Incidentally their mood is not going to be a submissive one; they are certain to be critical of poor teaching methods. Furthermore these same young men belong to a generation which before it went to war was taught in public schools to some extent by these same visual aids. The implications of these facts to American colleges are important. After all, colleges are the last stronghold of verbalism. Granting that the lecture method will always have an important, unique place in instruction at the college level, American colleges and universities may be due for a rude shock if they do not learn now the lesson that the armed forces have taught us in the value of visual aids in accelerating and improving instruction.

Other observers have already noticed that thousands of instructors in the armed services have been taught how to teach with visual aids. When these teachers return to civilian life they are bound to agitate emphatically and constantly for larger budgets for visual aids in schools. They are likely to insist that visual aids are as much a part of instruction as text books which are now traditionally considered to be essential and entitled to a definite percentage of every school budget. The demands for funds for visual aids after the war in schools are going to be insistent and certain to result in more liberal appropriations. The Army and Navy have shown us how the use of visual aids can expand when money is provided for them. There will be a demand for administrators of audio-visual aids to handle the enlarged program.

Even the new devices created by the war will change teaching methods. The Army has discovered the value of voice reflectors in teaching pronunciation of foreign languages. This was a natural concomitant of the Army emphasis on teaching a speaking and not a reading language. This is far removed from the traditional teaching of the grammar of a language first, a reading knowledge second, and finally, if ever, a speaking knowledge.

In the teaching of language the armed services have also made liberal use of disc recordings and foreign feature films. At the University of Minnesota we have continual showings of feature films in German, Swedish, Finnish, and Japanese. These films together with the use of voice reflectors as practicing instruments has put

the teaching of languages on a dynamic basis. The war has seen the development of cellophane tape recordings which can record speech acceptably for eight hours continuously at a very low cost. During the war these are used to record communications between planes and ground stations. After the war they may prove very valuable wherever the exact content of a long interview is important. Psychiatrists and school counselors may find the cellophane tape recording the answer to their problem of recording an hour long interview at little expense.

Three dimensional slides using standard lanterns have been perfected during the war and have been seized by the Air Corps among others to teach map reading and aerial reconnaissance. The fact that these slides can be used in any standard projector eliminates once and for all one of the great handicaps for three dimensional projected pictures. No longer do we need to buy expensive dual projection equipment especially for this purpose. Apparently no handicap will prevent the using of color in three dimensional slides to add still more to the realistic effect. Of course, special viewing glasses must still be used and it is likely that they will always need to be used to reproduce the effect of binocular vision. In other words three dimensional projection has reached a new high plateau of perfection. The next most important step is for teachers to realize that they must accept the students' use of viewing glasses as naturally as the traditional pen and pencil. Once we do this the field of three dimensional projection will expand enormously. The perception of three dimensions is tremendously important to realism and accuracy in visual aids;—far more important than the trivial handicap of viewing glasses.

The audio-visual programs of the armed services are therefore going to have a number of important effects on post-war civilian education. They are going to return thousands of teachers to public schools thoroughly trained in the use of visual aids. They have provided a demonstration of what visual aids can do when they are not hampered at every turn by lack of money, and this, together with the attitude of returning service men, is bound to bring pressure to bear for increased appropriations for visual aids. They should greatly hasten the day of the integrated use of moving and still pictures on the same subject-matter. After the war there will be many new companies making visual aids, and competing for the school's business. These aids will be planned according to the new methods discovered by the armed forces, based on good teaching methods and sound educational psychology. Even new devices will revolutionize certain parts of our teaching methods. We can expect the use of visual aids to penetrate our institutions of higher learning more and more. To handle these increased programs we can expect administrators or coordinators of audio-visual programs to be accepted more naturally as part of our school administration. Following the war we can expect a great and intelligent expansion of the use of audio-visual aids in education. The adolescent days of audio-visual education are over and we can expect them to play a vital and mature role in American education in the future.

# The School Made Film for Purposes of Supervision of Instruction

Potentialities of the 16mm motion picture camera for in-service training of teachers and supervisors.

**MENDEL SHERMAN.**  
Cincinnati, Ohio, Schools\*

Making primitive forms of pottery by the coil method (from a film on Primitive Man.)

A BASIC concern of the able school administrator is to develop ways of improving instruction within the school system. Various methods are in use already. Teachers take work during the summer. They subscribe to and study educational journals. They attend professional meetings. Yet all of these methods do lack one essential factor, namely, they are removed from the actual teaching situation. A basic need is some method closely connected to the teaching processes. A technique that partially solves this problem is that of intervisitation. In Cincinnati, for example, teachers may have two days each year, with pay, for visiting other classrooms to observe a unit of work. This procedure is certainly one of the most valuable, and yet it has some important short-comings that can be remedied by use of the 16mm camera.

Teaching has changed in recent years from day to day assignments to long range assignments, planning and directed study procedures. Formerly a teacher could visit a class and in a relatively short time observe a unit of work which, on the whole, was of brief duration. Although there are still short units today, the trend is toward those which may last from six weeks to several months, even an entire half year. Intervisitation, valuable as it is, does not lend itself quite as profitably to this new type of planning which covers a much larger area than the old.

The area is often so large that intervisitation is usually done at the conclusion of the unit when a resume of the entire work is given by the children. At this time committees describe the previous activities they

have experienced. Their description is augmented by playlets and an exhibit of their handiwork as part of the resume. Actually, however, only the finished product is seen and the description of past processes must be in the form of a verbal rather than a visual presentation. The shortcomings of this procedure may be summarized as follows:

1. *Not all the teachers can visit the resume of a unit of work at the appointed time.* Other pressing matters may interfere. Many teachers who desire to see and are in greatest need of seeing the resume, find it impossible to be present. Usually a small percentage of teachers can attend.
  2. *A resume shows a unit in its entirety only.* While it is certainly desirable to see the "whole" the teacher often wishes to concentrate upon certain parts. This cannot be done however. She must take the whole scene enacted by the children.
- If visiting is done during the development of the unit one gets the opposite result. The part only is observed and not the whole. Very often the observer might not appraise accurately the place of the part in the whole picture. Both the whole and the parts should be seen in order to achieve interrelation of the two.
3. *Intervisitation presents a unit at a time when teachers have finished their own on the same topic.* This situation exists because all schools study the same unit at approximately the same time.

Thus a visiting teacher may become highly enthusiastic about the resume of a unit but can do little about it until the following year. A more desirable time for the presentation of such a resume would be immediately before, or a few weeks before

\*Mr. Sherman is now with the Training Film Library, Camp Barkeley, Texas.

starting her own. Then the follow-up could be immediate instead of a year hence.

4. *An intervisitation presents the situation only once.* The new teacher, especially, may desire several repetitions. Even experienced teachers, when starting a new unit or observing one worked out by another teacher, may wish to have the situation or parts of it repeated. Intervisitation will not permit this. One cannot request the children to repeat the unit or parts of it. In this respect the situation is similar to listening to a radio broadcast in that there is no repetition, no turning back for a review. A learning situation, even for the expert teacher, contains numerous aspects. To expect mastery of these aspects in one presentation is contrary to what we believe about the nature of learning. Very little of our knowledge is the result of one presentation.

An application of the principles mentioned up to this point is illustrated in the unit, "Play Through the Ages." This project, developed by a teacher in an elementary school, was presented in resume at the conclusion of the unit to a group of teachers visiting the class on invitation by the director of upper elementary grades. This final presentation was followed by much discussion. The teachers present were treated to an interesting teaching procedure. Many teachers of the school system, however, could not attend at the scheduled time and to those the opportunity was lost.

It is in such a situation that the 16mm camera can make its great contribution. It can record the unit for those teachers who were not present. Furthermore the film can be filed at the visual exchange of the school system and can be distributed to the teachers upon request. Thus every teacher, not just a few, can see the complete presentation of the unit. Many teachers returning to their schools, after seeing "Play Through the Ages," described it to their colleagues with the remark "you should have been there so you could have seen it yourself." A 16mm movie would enable the speaker to put such a statement in the present or future tense instead of the past.

This unit contained many interesting processes during its development. That the teachers were keenly interested in these activities was evidenced by the following discussion. The teacher in charge was called upon to describe the making of the stained-glass window, the costumes, the castle scene, the puppet show, the musical instruments, the obtaining and using of materials, and numerous other processes culminating in the finished product displayed before the teachers.

Undoubtedly every teacher present would have liked to see these activities during their development even though the verbal descriptions were as complete as possible. By means of the 16mm camera every process described by the teacher in charge could be made visual. The film brings out, for example, the steps in making a stained glass window. These procedures would include (a) the committee searching through reference books, (b) seeing several stained glass windows in the vicinity, (c) gathering the necessary materials, (d) outlining the work, (e) drawing, painting and other salient steps in the rest of the preparation leading to the finished product.

The movie would also include the approach to the

Some primitive musical instruments.

unit, as well as the various processes in all other activities of the children. Besides the processes, there could be included a resume of the complete unit such as was presented to the teachers. Thus a teacher could isolate and concentrate upon certain parts and could also see the relation of the parts to the whole. "Play Through the Ages" could be seen as a complete unit. At its conclusion we could repeat the film and concentrate upon the puppet show. There is little danger that the importance or purposes of the puppet show, for example, will be underestimated or overemphasized if the teacher has available the film of the entire unit, including the part played by the puppet show.

A teacher desiring a repetition of a unit will find a ready tool in such a movie. The teacher who remarked that she would like to see the unit again would appreciate the willingness of the movie film to accommodate such a request. The forming of committees and their activities in making reports, using references, making models, building castles and making stained glass windows can all be seen as many times as desired. And when the memory of any part of the unit grows dim it can quickly be recalled by a repetition of the film or any part thereof.

Judging from the discussion and the interest displayed at the resume, it was evident that there was much enthusiasm about the presentation. Many teachers looked back at their own units on the same topic and saw numerous ways in which they could have improved them. Some made written notes or tried to commit to memory ways for improvement next year when their class would again study "Play Through the Ages." By next year, however, much will be forgotten since the situation has been presented only once. The enthusiasm will undergo considerable change. Perhaps some aspects of the unit will take on more importance in the minds of the teacher than these aspects warrant. Unquestionably, a greater benefit could be derived from the presentation of the unit if it could be seen just before the teacher started her own work on the same topic. Here again the movie would be a valuable asset. No memory or written note could compare with an actual re-presentation of the unit. In fifteen minutes the teacher could review the entire project. If she was present at the resume, all the situation would be

vividly recalled and with it all the processes that occurred. Undoubtedly the enthusiasm she displayed ten or so months ago would also return. If she had not been present, she could still see what had been done ten months previously and could use this knowledge in planning her own work.

Not only could the teacher view the film before starting her own unit but the flexibility of the medium would enable her to use it during the progress of the unit. Thus it could serve as preparation, guidance, correcting procedures or rechecking at the conclusion of the teacher's own work along the same plan presented in the film.

An added value of the film is its use in meeting individual needs among teachers. The supervisor can group teachers who might discuss problems peculiar to a small group. Teachers new to the school system, teachers in communities with special needs, beginning teachers and teachers with no training in the unit to be taught, are possibilities for various groups. In some cases it might be desirable to show the film to a single teacher in order to meet her individual needs.

Another feature of the film is its possibility for being kept up-to-date. The film can be revised. Obsolete material can be deleted and replaced by newer activities or better approaches. Although the film would not be permanent, its value could be prolonged by revision, a process easily carried out by refilming and splicing.

Because of the apparent possibilities of the movie film in supervision of instruction the writer made a movie of a classroom unit with this purpose foremost in mind. It is true that such a film has its use for public relations and in value for the pupils as a result of the planning and writing of the scenario. But the primary purpose was to prepare a film for use by teachers and teachers-in-training for improvement of instruction. The pretentious title of the film is "The Sixth Grade of Central Fairmount School Presents Its Unit on Primitive Man." Everyone in the class presented written suggestions to the scenario committee who combined the suggestions and presented them to the class. Much writing, rewriting and planning resulted in the

Many years ago before history was written there were two boys, OG and UMPA. They lived in a cave. One night there was a storm and lightning struck a log in front of their cave. In the morning OG stuck his head out of the cave and looked with amazement at the burning log. He was so frightened that he quickly ducked back into the cave. OG got back his courage and again looked out, calling UMPA.

OG and UMPA carefully walked around the log until OG touched it and burned his fingers. Both boys ran back into the cave. When they came out the fire had gone down and both boys were angry. They began to beat the log and rub it with sticks. They noticed that the rubbing made the log warmer so they continued until the dry log was again burning. They could feel the heat. OG suggested that UMPA get some meat on a stick and see

# Storage Problems in Audio-Visual Aids

GORDON C. GODBEY

Lexington Signal Depot  
Lexington, Kentucky

**I**N THE gigantic work of training thousands of men for the all important job of winning this war, many situations have come up that were not covered by Army Regulations; that is, often the job called for something that had not been used or even thought of before. When such a situation arises, there is only one thing to do—overcome it. Results, not excuses, count in the world conflict.

Frequently small things affect the outcome of larger ones, not only in military life, but in the whole course of human affairs. "For want of a nail the shoe was lost, for want of a shoe the horse was lost . . . . . " In such a situation, some blacksmith who made nails that did not lose out of horseshoes might have changed history.

In getting the job done at the Lexington Signal Depot, the Training Division's Training Services Branch faced two small problems that have doubtless faced instructors in other institutions. Col. Laurence Watts, Commanding Officer of the Depot, and Major W. Gayle Starnes, Chief of Training, have given every encouragement to instructors and training officers to use audio-visual aids to the utmost. Providing those aids is the task of the Audio-Visual Aids Section within the Training Services Branch; accompanying that responsibility are the usual problems of maintenance, storage, etc.

The seemingly simple problem of storage caused one of the first problems. As ever increasing numbers of film strips accumulated at the film library, space had to

Home-made rack for the storage of film strips.

A device, designed by the author, for holding 40 x 60-inch charts used in Signal Corps classes.

be provided for them—space in which they could be easily picked out from the numbers on top of the cans. At first, racks in drawers were used, but the round cans did not fit well in the partitioned space, and became misplaced easily. The next storage space consisted of horizontal racks one-half inch wider than the cans. This was not satisfactory since cans rolled out unless the rack was full; in addition the lower racks were not visible unless one stooped to look into them.

After a futile search through catalogs of commercial supply houses, it was decided to design racks to suit the need of the Section. Mr. J. B. Conley, draftsman-designer of the Audio-Visual Aids Section, worked with the author until the holder shown was evolved. There are several advantages to this type rack; each film is visible, any film can be easily located since the filing system is flexible (numerical only); the rack is light enough to be easily moved from place to place. This particular rack is thirty-six by thirty inches on the face with a fourteen by thirty-six inch base, holding 204 films. The size could be altered to accommodate any number of films.

Again, in the Depot schools where the operation, installation, and maintenance of Signal Corps equipment is taught, need was found for enlarged schematic diagrams. This language of symbols used by radio men is difficult to verbalize—difficult if not impossible. When a diagram must be memorized the student and instructor at once fall back on the fundamental language—pictures.

Blow-ups of schematic diagrams were made on cardboard flats forty by sixty inches. These were just the lecture aids needed before classes of from fifteen to forty men. After some weeks, however, the charts became dirty, bent, and generally abused. This was a result of the fact that ten to twenty charts forty inches by sixty inches take up a good deal of space when laid

(Concluded on page 172)

# MOTION PICTURES— NOT FOR THEATRES

By ARTHUR EDWIN KROWS

**H**ERBERT Clarke Hoover, who then sat in the White House, was by nature and experience in favor of any development which would ultimately help to raise the level of popular education. He was satisfied of the sincerity and competence in this respect of Harley Clarke. So, June 15, 1931, President Hoover authorized the issuance of a letter by Walter H. Newton, his personal secretary, to the Governor of each State, inviting coöperation in furthering the Clarke plan. The letter was skillfully prepared, possibly by Clarke himself.

According to the context it was "at the intercession of the representative public school authorities" that "Mr. Clarke of the Fox Film Company has agreed to prepare" a number of educational films for the purpose. But the "representative public school authorities" who might object to the implication, could read also concerning the plan that, "It is not proposed that it shall lead to exclusive privileges for any particular film company either in the tests or in the subsequent preparation of films, if it should be found that a definite educational value can be introduced into the schools through the use of such films."

The plan itself was simply to hold, at Washington, D. C., from July 6 to 10, 1931, less than a month from the date of the letter to the Governors, a test of the effectiveness of educational films upon a class of representative grammar school boys and girls. The youngsters were to be one boy and one girl from each State, to be selected by the given State superintendent of schools, the pair to be accompanied to and from the Capital by an educational official and all expenses paid.

While arrangements to respond to this offer were being made, the Fox Film representatives in Washington requested and obtained the coöperation of the U. S. Bureau of Education in organizing a group from the National Education Association, George Washington University and the Washington city schools to formulate the detailed plan and conduct the proposed experiment. Members of the committee thus chosen were: Bess Goodykoontz, assistant commissioner of education, U. S. Department of the Interior; Jessie La Salle, assistant superintendent of schools, Washington, D. C.; Elsie S. King, of the research division of the N.E.A.; Mina M. Langvick, senior specialist in elementary school curriculum, office of education, U. S. Department of the Interior, and Dr. J. Orin Powers, associate professor of education at George Washington University.

All of the States, save the State of Washington, sent boys, girls and proper

guardians. The films selected for the test, out of a number made available for consideration, was five, although a few other subjects, patriotic in nature, were shown during the event. The five principal talking pictures were: "Toads" and "Monarch Butterflies," with accompanying lectures by Dr. Clyde Fisher of the American Museum of Natural History; "Volcanoes," "Glaciers" and "River Valleys," with recorded talks and demonstrations, including the celebrated "chalk talks" by Dr. Wallace Atwood of Clark University. The general conclusions were that sound pictures are twice as effective as silent ones, and that, after seeing the pictures, the boys and girls knew twice

**President Herbert Hoover felt that Harley Clarke's plan to test Fox educational talkies merited authority and support of his high office.**

as much about the given subjects as they did before. The full report of the committee was published and distributed gratis to educators generally, as legitimate, further, wholesome publicity for the Fox non-theatrical program.

The "Movietone School Series," replacing the "Fox Hour" designation, now began in earnest, with the hand of Harley Clarke much in evidence. The department was conducted from the address of the Fox Studios, at Tenth Avenue and 54th Street, New York City. Old friends became active. Wallace Atwood made a two-reeler for teacher-training institutions, entitled, "The Educational Value of Modern Films," in which he discussed varying techniques and summarized the series. For the series seventeen reels of his physical geography pictures were scored with lectures. He also began a

**Part 56—Schools, churches and industries were chief bones of contention in the first skirmishes of the talkie revolution. However, spoils did not necessarily go to the victor.**

set on "Occupational Geography, or How People Live." Dr. Forest Ray Moulton reappeared, this time with pictures and lectures on "The Story of the Stars" and "The Moon and Its Phases."

Influential newcomers to the Clarke fold were Dr. Clyde Fisher, who had been re-scoring British natural science reels for Erpi, and who now did some of much the same sort for Fox Films, and Dr. Henry Johnson, professor of history at Columbia University, whose patriotic films were the ones shown incidentally to the youngsters during the Washington experiment. To make the "Movietone School Series" catalogue really impressive, there were available also prints of the new theatrical magazine reel, "The Magic Carpet of Movietone," and the old non-theatrical Fox releases.

General selection of subjects to be produced by the Clarke department was a duty assigned to Dr. Ellis U. Graff, former Indianapolis superintendent of schools, president of the department of superintendence of the N.E.A. from 1919-1920, and president of the National Textbook Company. An innovation of importance, showing that Clarke was not heedless of current trends, was the establishment of a Woman's Bureau of the educational department, with Mrs. Grace Allen Bangs, in command. The regional addresses, for obtaining additional information about the work, were those of the offices of Clarke's General Theatres Equipment Corporation. There inquiring educators could have, too, demonstrations of the new Acme sound-on-film projector.

But further consequences of the talkie revolution, which had so coincidentally tossed this opportunity into the lap of Harley Clarke, gave him too little to improve it. The General Theatres Equipment Corporation was used as collateral in bank borrowings, and presently Clarke was superseded as president of Fox Films by a banker, and G.T.E. went into receivership. His vast utility company holdings became unmanageable also, in circumstances involving the collapse of the financial empire of Samuel Insull, of Chicago, with whom he had been associated. It was said that Clarke was definitely and completely ruined, that he had lost in all of this experience approximately a hundred million dollars. Nobody knows. But while Harley Clarke is Harley Clarke there is no telling whether he is finally stopped or not. See what a fire-bird he made from the ashes of an earlier film disaster.

It seemed like an effort of Clarke to provide, in the midst of his overwhelming difficulties, for the security of a pet enter-

prise, that, when the Movietone educational project went under, there began a plan to salvage it. What was called the International Film Foundation was formed in New York City as "an independent non-profit organization for producing and distributing educational films." It was asserted that it had no affiliation whatsoever with any motion picture producer, save that it was an outgrowth, "in some measure," of the Fox educational film department. Its first operations were to be financed by expected returns from a picture showing the aftermath of the Great War, assembled from Fox news-reel material. The picture was to be entitled, "The Cry of the World." Dr. Atwood was the elected president of the new Foundation. Clyde Fisher was represented in it. Mrs. Bangs was its executive head. But, then, like Little Eva, the venture just faded away. Mrs. Bangs became later the director of the Women's Club Bureau of the *New York Herald-Tribune*.

### The New Machine

HOWEVER coöperative the producing companies which leased the Western Electric recording equipment might be, it was not politic to permit them to have too much of the educational production responsibility. So Howard Stokes concluded to find a producer to serve on Erpi's own staff. The opportunity was offered to me, and, as the ruinous competition of talking pictures was now beginning to tell on Eastern Film Corporation, where I was then employed, as it was on the other makers of silents, I accepted as quickly as I could arrange to do so. That was about March, 1930.

The flourishing Electrical Research Products, Inc., of this period was an enterprise the magnitude of which inspired awe. There were about seven hundred Erpi employees in the Fisk Building alone, and many departments, each bustling with actual and potential business and with its own ideas of new developments. The lines dividing these departments, however, were becoming more sharply defined. First of all, the entire enterprise was becoming functionally distinct from Western Electric, the parent company. The engineering division was losing its force in production and narrowing more to aspects of servicing studio and theatre installations already made under lease; the sales contingent, having supplied most of the leading studios and theatres, also under lease, was concentrating on those places which had taken over competitive equipment, to persuade them to replace with Western; an experimental testing section was growing rapidly, with strong ties to the Bell Laboratories; the so-called educational division, under Devereux, was steadily qualifying to speak, within the Bell System, for the entire non-theatrical field. And, so far as the educational division was separately concerned, that was steadily subdividing into educational research, production and sales.

Educational research was at first most restricted. The other subdivisions had their operations scattered over the entire non-theatrical field, embracing churches as well as schools, factories, hospitals and the rest. The non-theatrical salesmen in the several branch offices were probably most conscious of this generalization, but they were regarded mainly as "contact men," the specialist salesmen operating from the home office. In Washington, the national capital, was Hanson E. Ely, Jr., son of the celebrated war hero, General Ely, then commander of the Second Corps Area of New York. "Hanse" was supremely useful for his diplomatic contacts among Government officials. In Los Angeles was Pat Campbell, whom I had known in the long ago when he was Paul Campbell, a cub press agent at the old Thomas H. Ince Studios in Culver City, but now an adult, aggressive "go-getter," wise in the ways of celluloid. At Pittsburgh was Arthur J. Wilson, son of one of the smaller coal operators, but with powerful and intimate friends variously in United States Steel Corporation, among members of the railroad dynasty, and at the H. J. Heinz food-packing plant. In Detroit was the hustling, conscientious W. G. Nichols—known to us as "Nick"—accurately informed on the automobile industry in all of its phases, and especially valuable for his intimacy with the prosperous non-theatrical producers of the area, Handy, Wilding and Caplan. In and around Philadelphia and Trenton moved a friend of Nichols, Robert Spears.

Members of the New York sales group were assigned to what seemed to be the obvious markets. Like their brethren in the field they were concerned primarily with talking picture projection equipment; picture production was then a possibility only dimly, wishfully seen. Edgar M. Stover, as an educator, was assigned to schools, although not too intensively because it was believed that schools would pretty much care for themselves in proper time. Churches were shared by Robert M. Donnelly, a trained advertising man, concentrating on Catholics, and Wendell Shields, son of the Rev. James K. Shields, who had sold his services to Erpi very early as an expert on motion pictures among Protestants. Paul J. Strickler had hotels, Henry F. Gremmel had department stores. And upon Frank H. Arlinghaus devolved attention to the medical groups, embracing chiefly hospitals and professional schools. John A. Thayer, son of a former president of the A. T. & T., was somewhat of a free lance. Head of the sales division, over all of these men, at headquarters and in the field, was the brilliant Edward A. Eschmann, former sales chief of First National Pictures. Assisting in coordination of the work of the representatives, with numerous charts and other collected statistics, was Jack Hanford. The office manager was Ray Zimmer, one of the most even-tempered men I have ever known.

were, of course, various other lesser representatives.

It was supposed that picture production, apart from the making of school subjects which were going to require an unprecedented attention, would be cared for by non-theatrical licensees. Licensees, however, were not signing up as readily as had been expected. Non-theatrical producers generally were interested in talking picture equipment, of course, and many came to inquire about terms, usually to bow themselves out again promptly when they heard the originally stiff stipulations. Beside, the Erpi management was very particular. It did not wish to do business with firms which could not or would not produce evidence of their capacity to develop the field and pay royalties. The rub was that, in Erpi's opinion, only two or three could so qualify.

### The Sponsored Talkie Boom

ERPI was in no hurry to modify this opinion because of a new development which looked like a solution. The demand in the theatres for sound films was so overwhelming that even advertising subjects which talked were welcomed there. National advertisers quickly saw their opportunity to reach much greater audiences, and had talkie industrials produced for them by the major theatrical companies. One automobile account sponsored an advertising subject called "Studebaker Champions," in which appeared the Roxy orchestra, Florenz Ziegfeld and flash numbers from his "Follies." The theatrical companies, in turn, saw unexpected opportunities for larger revenues, and again considered the possibilities of conducting departments of industrial production.

Warner Brothers reaped a harvest by circulating advertising talkies through its newly acquired Stanley Chain. Paramount made a few such subjects experimentally and opened a tentative department in connection with the Paramount News division, where Emanuel Cohen presided. Paramount was a theatrical licensee of Western Electric, and, of course, this newer development without a non-theatrical license was somewhat irregular. But Paramount contended that it wanted first to prove the possibilities, and this seeming reasonable to Erpi in view of the large sums mounting from the theatrical talkies multiplying from this source, Paramount made its industrials on a pending arrangement which, as it happened, never materialized in license form. Erpi had ambitious ideas about licenses in those days. There were to have been separate producing licenses for making school films, for churches, for industry, for department stores and so on.

Francis Lawton, trained in high pressure advertising and sales, and a former vice-president of the Jam Handy organization, felt that here was the big opportunity for industrial films, and became sales manager for the Paramount experiment. His chief immediate qualification was that he had negotiated

through Fox-Case a four-reel picture on safety for the American Gas Association. Unfortunately that picture had been poorly received in its debut before a trade convention. All the same, it was a talking picture, the mixed result was not Lawton's fault and he had obtained the contract. As that contract represented an impressive sum of money actually paid, it surely was somewhat of an achievement. Lawton, with usual energy and determination, armed with his exhaustive statistics and this backing of a really celebrated Hollywood name, went to work lustily on the new opportunity. But, despite the gathering momentum of the situation, his prospects were slow to move. It was decided, then, that Paramount must have an industrial subject at any price to open the field for itself. It was deemed so necessary that Lawton was eventually ordered to find a beginner, even if Paramount only "broke even" on the costs.

It happened, at this time, that Alison J. Van Brunt, director of safety education at the Public Service Corporation of New Jersey, was about ready to make his annual or biennial picture. As an old hand at supervising film production in his field, he could see no reason why this time he should not have something better than anything he had previously attempted, and, of course, it certainly should be a talkie, especially after the "unsatisfactory" safety picture made for the A.G.A. To discuss the situation he had tried to phone me at Eastern Film Corporation, and, discovering that Eastern Film Corporation had ceased, he finally reached me one evening at home. Learning of my new connection at Erpi, nothing would do but that I should write and direct the new subject for him. I tried to explain that all I could do then for him through Erpi was in the educational division, and that for production he would have to negotiate with one of our industrial licensees; but dogged old Van Brunt would not be put off with such excuses as that.

When the Erpi officials heard about the situation, they suggested that, as the insistence was on the part of the client, and he was asking for me personally, merely as writer and director and not as Erpi representative, I might let the matter develop, and, no doubt, ways and means, naturally appearing thereafter, would satisfy all persons concerned. There were no precedents, of course, and apparently the responsibility had become mine. So I proceeded with caution. Van Brunt was willing to cooperate so long as it was understood that I would direct. The scenario was written and several production concerns which had solicited the business were notified of their respective opportunities to bid. Among the representatives who appeared in answer at Van Brunt's office in Newark, was Francis Lawton, Jr.

Hearing the stipulation that I was to direct, Lawton concluded that Erpi was

trying to compete for the business against its own licensees. He called me indignantly, after the meeting, and I said, "I'm going to have Mr. Adcock" (I later telephone Mr. John E. Otters) protest that Erpi is using you, one of its own employees, to discriminate against Paramount." Not blaming Lawton for his stand, but unable at the moment to discuss the policy situation with him, I laughingly urged him by all means to proceed along his proposed line, because, I told him, if the president of Paramount would take the trouble to communicate with the president of Erpi concerning me, it would definitely prove that at last I had become important in the industry.

What transpired, to Lawton's great relief, was that the account was awarded to Paramount as the lowest bidder—I already have mentioned the reasons for

**Urged of Erpi's ability to spread the work of his Yale psycho-clinic, Dr. Gesell once more consented to demonstrate for a commercial film.**

the Paramount desire to have the business on even a low-cost basis. With Paramount as producer, therefore, and Lawton as sales go-between, I wrote and directed the reel in question at an amazingly modest and probably unprecedented sales price at that time, of \$4,000.

It is difficult to believe, looking backward, that the established film men could have so deluded themselves as to the supposed permanence of this public acceptance of screen advertising. But nearly all the major distributors took a hand at it. One of the most notable cases was that of "Kinograms." Captain Baynes and Thomas Evans, a laboratory man closely associated with him, decided to turn their once well known newsreel into a vehicle for advertising. In January, 1934, they reincorporated under the laws of Delaware with a stated capitalization of \$100,000. They offered "space," or "screen time," to national advertisers on a basis of \$20,000 for a

guaranteed audience attention of quarter of a million persons, and, this not being taken promptly enough, \$3,000 "just to get them in." They induced four large advertising agencies to cooperate, among them McCann-Erickson and J. Walter Thompson. They even signed Henry Ford, the contract to begin as soon as his radically changed new car model, the celebrated "Model A," appeared.

Then, all at once, the bottom dropped out of the "sponsored films" market. Kinograms burst like a bubble, and about one month later appeared the Ford car which might have saved it. The makers of the disinfectant "Lysol" had succeeded beyond expectations with a Max Fleischer animated cartoon showing a comic warfare between mankind and germs; the manufacturers of "Chesterfield Cigarettes" had delighted many audiences with several items in a Paramount series of revived newsreel shots of long past events called "Movie Memories,"—so successful, indeed, that, when the advertiser was obliged to drop out, Paramount continued it without the sponsor's name as a novelty short.

But audiences here and there, becoming quickly used to talking pictures and therefore critical of the product, had decided that they were being imposed upon with advertising matter when they paid for their tickets, and one day they had hissed. Eugene Castle wrote indignant letters to the press demanding that theatres be made to specify ad films as such, and even threatened court action to compel it. An acknowledged hisser was George F. Delacorte, Jr., publisher of the magazine *Ballyhoo*. He attended an uptown New York theatre, it was reported in January, 1932, and saw there a film advertising a railroad. He protested this so loudly that the exasperated manager had him arrested. When he was reprimanded by the police lieutenant who told him that he might have started a riot, he replied, "That's just what I wanted to do."

And finally the exhibitors' associations, seeing the danger of their position, ruled definitely against sponsored films of any sort. Thus, for that period, at least, there could be no more money to be made there. Warner Brothers, probably the most active in the field through the former Stanley Chain, abruptly closed its department which had been running in high prosperity under Ben K. Blake. Paramount did the same, and then naturally informed Erpi that it had decided not to take out an industrial license.

By that time, however, Erpi had set a precedent for its own production of industrial talking pictures when I made the subject for Van Brunt, and thereafter the salesman went more strongly after production accounts, the procedure being, when one came in, to execute it through the facilities of some licensee, under Erpi supervision.

# The Film and International Understanding

## The Film Distributor and International Understanding

DR. JOHN E. DUGAN, Editor

Haddon Heights, New Jersey, Schools

THE phenomenally rapid expansion of the use of the film in the field of international understanding has caused actual practice to follow hard upon the heels of theory and discussion. This rapidity of practical results has to a great extent been made possible by the functioning of a key factor in any extensive film program—the distributor. The distributor may be an individual, a firm, or an organization; but his central position of service and importance remains the same. He is the coordinator who makes practical results possible.

Educators may enunciate the desirability of certain types of films; producers may even produce them; but little of a comprehensive nature in the use of such films can be accomplished until the distributor steps into the picture. He is the coordinator who brings supply and demand together. Sometimes he may create one to satisfy the other. Thus he becomes a creative factor in visual education, rather than just a "filler of orders" for "listed films".

Sensing the desirability for certain types of films, the distributor may canvass the field for available material or may induce a producer to make films of that particular type. On the other hand, realizing that certain available material could be appreciated and used more extensively for current needs, he may organize and present information regarding it in such a way that its use is stimulated to the advantage of all concerned. All of these phases have been evident in the contribution of the distributor to the expansion of the use of the film in promoting international understanding.

Educators, governmental agencies, and others became interested in the use of such films. Special films for international understanding were produced. Notable among these were the films of the Co-ordinator of Inter-American Affairs. There was discussion and experimentation. The possibility of using films or parts of films which already were available was discussed. Expansion took place in all directions. But the central

problem in the promotion of all this development was that of getting actual films to actual users, and here the distributor had a key part to play.

An important fundamental preliminary to getting films to users was the organization and presentation of information regarding films which were available. The distributor could not content himself with merely listing what was available. He had to make his advertisements attractive and appealing so that readers would want to use what they saw listed.

Various agencies of our own and other governments were notably active and successful in opening up the field; but even they depended upon the distributors for the real footwork. Because of this situation, distributors at first tended to list films in the field of interna-

A scene from "Rigoletto" as performed in "Leningrad Music Hall."

tional understanding according to the agencies which sponsored them. A step away from this was the offering of unit programs which might include films from several sources. Then there were various types of "film festivals" which presented films in this field from a variety of sources. The latest development, and apparently the most desirable, is the organization of a body of film resources about a particular topic, region, or nation. This tendency

is evident in the new catalogues which are being issued. Various producers and distributors are contributing to this new development in a number of ways.

The most comprehensive presentation of this sort which has come to the attention of this department is the recent Brandon Films catalogue of "Films of the U.S.S.R." Its form and organization is such that it deserves special attention and consideration. The material is presented in a six-page folder, 8½ by 11 inches in size, which is most convenient for filing and easy reference. It presents 100 films about Russia "for better understanding—for lasting friendship". Short films and feature length films are

From "Chapayev", film on the early days of the Soviet regime, when it had to fight off intervention.

included. The material ranges all the way from Eisenstein's *Alexander Nevsky* to *Leningrad Music Hall*. Some were produced before the war; some are most recent. The 100 films are classified under four main divisions: "Our Russian Allies", "The U.S.S.R. at War", "Modern U.S.S.R.", "The History of the Russian People and the Growth of the U.S.S.R."

The division on "The History of the Russian People and the Growth of the U.S.S.R." is composed of thirty feature length films. These films originally were not made as classroom instructional films, but as entertainment pictures of important historic story material. These features may serve as auxiliary teaching aids to the study of the language, area, history, background, etc. The films are arranged in the historical order of the subject matter, and are listed under six sub-headings: "Pre-1900", "1905-14", "The Russian Revolution", "Civil War and Defense of the Republic", "Reconstruction and Building the New Way of Life", "Pre-War Anti-Nazi Films."

The fifty films which make up the division on "Our Russian Allies" are classified under the following sub-headings: "The People and the Republics", "Educa-

Stalin, Maxim Gorky and transpolar aviation ace, Chakalov seen in "Wings of Victory," reflecting Russia's interest in aviation in pre-World War II.

tion and Child Welfare", "Sports and Physical Education", "Agriculture", "Song, Music, Dance", "The People at War", "War Newsreels", "The Russian Front", "USSR and Eastern Europe", "Comedies".

The comprehensive nature of this list of films on Russia is further indicated by the fact that each film is briefly described, its running time given, etc. In presenting this type of list, Brandon Films has rendered a distinct service to the promotion of the use of films in promoting international understanding. It is to be hoped that similar lists of film resources for other topics, nations, etc. will be forthcoming in the future.

Illustrations accompanying this article were furnished through the courtesy of Brandon Films.)

### The School Made Film for Purposes of Supervision of Instruction

(Concluded from page 159)

what the fire would do to it. They liked the result and thereafter roasted their meat.

It is not supposed that such a movie will do the job alone. Other means of describing a unit of work and inducting the teacher into a similar task will be necessary. There exist certain shortcomings to the movie that make a combination of media desirable. The movie film calls for rehearsed scenes as only the important aspects of the work can be taken. These must be carefully planned. In planning these the film may pass hurriedly over or completely ignore an aspect of the work that another teacher may wish to know more about.

To give a more complete description of a unit with all static details, it is essential to accompany the supervisory film with a series of photographs or a film strip and a written description. The movie can cover the chief items and supply the necessary action. A series of photographs or a film strip can supply important settings that do not require action. These scenes can be used for detailed study. A written description can give a detailed account of the entire unit. This would take care of the strictly verbal or abstract phases of learning that do not lend themselves readily to filming. Included in the written description would be the bibliography, the materials used, provisions for individual differences, a discussion of the objectives, appraisal, and correlation with other subjects.

This combination of a movie, a film strip and a written description of a unit of work can make a definite contribution toward helping a teacher in her classroom procedure. Possibly such films are best made by teachers in the school system. Careful planning with supervisors, principals, and teachers and pupils will result in films that will be practical and acceptable from the teacher's point of view. School people producing such films will find that the process will help clarify their own objectives and the finished product will prove an excellent stimulus for improving their own supervisory and teaching procedures.

# Summer Courses in Visual and Audio-Visual Education, 1944

The following courses have been reported to date. Figures in parenthesis show semester or quarter credits. An additional list will appear in May.

<b>Arizona</b>			
<i>University of Arizona</i> , Tucson	June 5-July 8	<i>University of Cincinnati</i> , Cincinnati	June 20-July 25
Visual and Auditory Aids in Teaching (2)	E. L. Larson	Audio-Visual Aids in the Classroom (2)	Victor Coles
<b>Colorado</b>		<b>Oregon</b>

Audio-Visual Aids in Education (3)	Herschel Litherland	Visual Education (2)	Miles S. Masters
		<b>Wisconsin</b>	
		<i>Stout Institute</i> , Menomonie	June 19-July 28
		Visual Education I and II (2 each)	Paul C. Nelson
		<b>Washington</b>	
		<i>State College of Washington</i> , Pullman	June 5-July 30
		Audio-Visual Education (3 or 4 qr.; 2 or 3 sem.)	Claude Simpson

An additional list of courses will appear in May. Readers who know of visual courses to be given this summer are earnestly asked to send us names of the institutions offering them, with as complete data as possible.

# Miscellany of the Month

## Events and Achievements

**M**ARSHALL College (Huntington, W. Va.) has promoted study of Inter-American relations by opening a "Campus-Center" for programs with films, speakers, discussions. Primary aim to train teachers for classroom emphasis on the subject.

- The month-long Red Cross Drive (\$200,000,000.00) is getting nation-wide support from movie exhibitors. In the first week some 15,000 theatres had pledged "collection at every performance," and record collections were already being reported toward their \$10,000,000 quota.

- A choice bit of visual education from Portugal. The old university town of Coimbra has just finished its "children's city" within a city park—houses, streets, squares, townhall, stores, marketplace, church, harbor, lighthouse, etc., all in miniature, proportionate to the under-seven-year-olds for whose educational experience it was designed.

- Nelson Rockefeller has finished a two-weeks tour, his first official inspection of South American agencies of the Office of Coordinator of Inter-American Affairs.

- Re-release of *Snow White* (1938) is reported breaking records as it deserves—e.g. 10,000 saw the February premiere in Cincinnati. And the London premiere (February 28) of *Madame Curie* yielded over \$20,000, the proceeds turned over to the Marie Curie Cancer Hospital.

- The Department of Visual Instruction of the Chicago Schools (Joseph Dickman, Director) has placed 20 prints of 20 Erpi Sound Films in each of Chicago's forty High Schools for their permanent possession—a little item of 800 films! The 20 titles were determined by majority vote of the forty High Schools themselves.

- Another war development—16mm reduction-printing from 35mm sound films is now near perfection. By processing picture and sound track separately, there have been achieved higher fidelity sound, sharper pictorial contrast, capacity for greater enlargement on screen, and speedier processing.

- Paramount's location department maintains a permanent reference file of 2 x 2 Kodachrome slides made on scouting trips. Projected at studio, these are invaluable for selecting sites and backgrounds for forthcoming pictures. Some 500 slides made recently for a single production sufficed also to determine locations for a following feature.

- The new tax (April 1st) on movie admissions, about double previous rate, results apparently in raising all admission prices about one dime each. This will put some \$300,000,000 into the national war chest. It is estimated that 90% of amusement tax collections are from motion picture theatres.

## Surveys and Statistics

**T**HE Adult Education Council faces heavy post-war problems, as reported by its Survey Staff, George D. Strayer, Chairman. The Council, now handling a 40,000 audience, should take on another 360,000 men and women over 25 who never went to any school, plus 3,000,000 adults who never went beyond 8th Grade. A perfect job, this, for the sound motion picture.

- During 1943, the Army Overseas Film Service, through 19 Exchanges, gave over 1400 shows nightly—369 features, 556 shorts, 520 newsreels. Of the features, 10% were war films, 18% had war background, 72% made no reference to war. (At home, newsreels were 89% war).

- Will Hays' annual report emphasizes the Industry's tremendous part in maintaining military and civilian morale by its regular production. In addition, it supplied free over 9500 prints of over 200 current releases for use in combat areas around the world—to the Army's production of 708 training films, it has contributed 108 at actual cost—and over 1500 actors have made over 12000 free personal appearances on some 2200 programs abroad—not including countless shows and appearances for millions of the armed forces in 930 military screening centers at home.

- Hollywood evidently "does its bit" not only by pictures. About one-third (6500) of the motion picture industry (19,600) is in the armed forces. Nearly one third of that third, (1950) were actors and staff-members of the studios.

- First survey by the Morale Division shows that 7% of our armed forces think they will go back to full time school or college after the war, 17% are thinking of part-time. Much will depend on economic conditions and government aid. Incidentally, the 7% represent about 40% of the total 1940 enrollment of all colleges and universities in the country.

- February saw weekly Hollywood production at new low for 12 years—30 pictures shooting. By mid-March 37, and 46 by end of month. (Last year saw a February low of 33 climb to 51 by July and hold to near-December).

- CBS report for 1943 shows: 9329 hours, with 90 sponsors, comprised Music 38%, Drama 26%, News 16%, Variety and Comedy 10%, Talks and Discussions 9%, Religion 1%. Of all these, 58% devoted part or full time to war effort themes. In addition 800 expressly educational program periods were withheld from sale—Invitation to Learning, People's Platform, American School of the Air—the last with Teacher's Manual sent on request to 160,000 teachers conducting classroom listening periods. Likewise for 220 religious program periods, divided equally among all denominations.

## Plans and Predictions

**F**EBRUARY saw the formation of two impressive commissions—(1) A "Commission to Study Freedom of the Press, Screen and Radio," with Robert Hutchins, President of the University of Chicago, as Chairman. Results expected in two years. And (2) A "Commission on Motion Pictures in Education," with a membership of eminent educators and financed generously by eight leading firms of the motion picture industry!

- The O W I plans no expansion of its domestic film activity, is content with its present \$50,000 appropriation, and will leave production to more expert Hollywood. Robert Riskin, head of O W I's Overseas Film Division, announces half production completed and second half to comprise educational, industrial, health films, to show American life in relation to war and United Nations.

- Stettinius urges world-wide good-neighbor policy, built on C I A A pattern, using motion pictures and radio under sole direction of the State Department. Looks like an "Office of World Information" after all (Educational Screen, September, 1943).

- Warner will allow broadcast of its pictures only after four months of theatre circulation, because "radio doesn't do anything for a story property nor for the film's star."

- The Division of Visual Education (Philadelphia) has organized a group of over 100 students, from every city High School, for film review, criticism, discussion, with Director Paul E. Long in charge. Newspaper film critics, as leaders and advisers, will conduct the weekly sessions. Aim, to learn all about movies as Art.

- "Youth in Crisis," recent March of Time study of juvenile delinquency, is to be on sale to non-theatrical and educational field in 16mm sound prints.

- By next fall there is expectation of the end of raw stock allocations and of the two-year government control over the motion picture industry through the WPB Film Section. It would be the first major industry to be freed.

- There is reported a plan, now in work for the Massachusetts State Department of Education, to make about 20 very short reels for class use, to test out the field for more extended production—also a similar project of the Scottish Film Council in Edinburgh, backed by the Carnegie United Kingdom Trustees—all of which is pretty interesting news in wartime.

- Within ten years after the war, RCA's Ralph R. Beal told San Francisco Engineering Council, there will be several hundred television theatres open, showing events as they occur, on screens up to 15 x 20 feet, all connected into national television networks.

## In-Service Training in Visual Instruction In the Reading, Mass. Public Schools

DOROTHY A. ALLARD, Director of Visual Education

THE fact that many teachers in service have never been trained in the use of visual instruction tools convinced the director of visual education of the Reading schools that a program of teacher-training would be helpful in securing a wider use of visual aids in the elementary schools. Accordingly, with the complete cooperation of Dr. E. C. Grover, superintendent of schools, a two-year teacher-training program was organized.

Because the superintendent is such a firm believer in the value of visual aids in education, the teachers in the Reading schools are more than fortunate in the amount and variety of visual aids provided for their use. Each of the two large elementary schools possess a 16mm. sound motion picture projector, a stereopticon, an opaque projector, a filmstrip projector, stereoscopes, stercographs, lantern slides, filmstrips, beaded screens for both auditorium and classroom use, and other miscellaneous equipment. Of the three primary schools, housing grades one to four, two of them have practically identical equipment which is used between the two schools; while the third school has the use of the equipment in one of the near-by larger schools. The Junior and Senior High Schools, too, possess similar equipment. In addition to these aids permanently located in the various schools, the school department owns, for use in any school, the following materials: a 16 mm. silent motion picture camera, flood lamps, a "copy" camera for making film strips, and photographic lantern slides, and a "play-back" instrument for the reproduction of 16" records. Likewise, the Senior High School, and one of the larger elementary schools, each have a public address system over which records can be played.

In spite of the fact that there was so much equipment at hand it was felt that the teachers were not making the fullest use of the materials available. A few teachers had taken courses at Boston University and were doing excellent work in their own particular classrooms. However, these few teachers were not enough. Our ideal was to have all the teachers aware of, and trained in, the use of various visual aids. An analysis of the situation brought out the fact that the primary reason for the non-use of visual aids was the lack of knowledge, on the part of the teachers, as to the operation of the projectors, and a lack of training in efficient methods of instruction with visual aids.

Therefore, feeling that a knowledge of how to

operate the various projectors would give the teachers an incentive for more immediate use of the equipment, it was planned to offer to all elementary teachers a practical course in the operation of the equipment. This course was given free one afternoon a week for a ten to twelve week period, by the director of visual instruction. Instruction was given at the various schools where the equipment was located, thus, giving teachers practical experience with the specific apparatus which they would use. Instruction was on both a group and individual basis and no teacher successfully completed the course until she demonstrated her ability to use properly each type of projection equipment. The teachers were most coöperative and willing to learn and expressed satisfaction in the practicality of the course.

As a result of the course in several of the elementary schools in Reading all teachers are proficient in the use of their visual equipment, and in other schools over seventy-five per cent know how to use the various projectors. Furthermore, we find a definite increase in the number of instances when visual aids are being used. Also, we now have requests from teachers for the latest information and material in the field.

Having made the elementary teachers aware of the possibilities in visual instruction through an acquaintance with the various tools, the next step was to demonstrate some of the specific techniques to be employed in the most efficient use of these tools. Accordingly, in October 1943 a course in methods in visual education was offered, free, to the elementary teachers by the director of the department. This course has been held at one of the larger elementary schools one afternoon every two weeks over a period of twenty weeks. *Enrollment in the course was on a voluntary basis and the average attendance at each meeting was about thirty teachers out of a possible thirty-five!* In the opinion of the writer this testified to the fact that teachers sincerely wish to learn the newer techniques if suitable and practical opportunities are presented for them to do so.

The course consisted of discourse, demonstration, and discussion of the following topics: the school journey, the school museum, the flat picture, graphic materials, opaque projection, the stereograph and the stereoscope, the glass slide and stereopticon, filmstrips and their projection, and the motion picture.

This program has been interesting and worthwhile to teachers and director alike. The only disadvantage has been the insufficient time, the amount that could be allotted for the courses, to cover in as thorough detail as we would like all the phases of visual instruction. However, a good start has been made, and the hope is that the teachers will now have the courage, and the desire, to make a wider use of the possible visual techniques. It is also hoped that from the experiences of these teachers will come material for a practical handbook on the use of visual aids, or teachers' manual, that can be used in the Reading schools.

# 1,112 Lighted Pictures Help Mechanical Drawing Teachers Carry the Overload

## Lighted Pictures Can Make Your Work Easier and Accelerate the Learning Process for the Class

In these days of heavier teaching schedules and crowded classes, the Jam Handy Kit-set of slidefilms on Supplementary Aids to the Teaching of Mechanical Drawing and Drafting can help make your job easier.

Integrate the slidefilms with whatever classwork you desire. Watch the films speed up the learning process and increase the students' memory span.

Each of the 1,112 pictures in this Kit-set, when projected, is the equivalent of a full sized blackboard drawing

or carefully prepared chart. Yet, all of them are readily available and any one picture can be projected at a moment's notice. While students can learn visualized data more rapidly, so also teachers can present such data more efficiently the "slidefilm way".

Use the coupon below to get full details on how you can pre-view these films in your own classroom. Or, if you wish, we will be glad to enter your order for the complete Kit-set at \$55.50 f.o.b. Detroit. Shipment can be made immediately.

### Here are the subjects covered in the slidefilm Kit-set:

- Measurements & Measuring (Parts 1 and 2)
- Scales and Models
- Addition and Subtraction in Geometry
- Multiplication and Division in Geometry
- Angular Measurement
- Constructions
- "T" Squares and Triangles (Parts 1 and 2)
- Geometric Construction (Parts 1 and 2)
- Drawing an Anchor Plate
- Layout Work (Parts 1 and 2)
- Slotted Anchor Plate
- Layout Tools and Measuring Instruments
- Plotting Graphs
- Analytic Geometry

### PRODUCTION-UTILIZATION

**WHAT THE ARMY AND NAVY ARE TEACHING US ABOUT VISUAL AIDS: A SYMPOSIUM—**  
*California Journal of Secondary Education* 19: 14-29 January, 1944. 50 cents.

Featured in this issue is a symposium of five articles reporting on the use of visual aids in the Army and Navy. In an editorial introducing this symposium, Dr. Frank W. Thomas, president, California Society of Secondary Education and president of Fresno State College, calls attention to the impetus the war has given to visual instruction. Out of the pressure of wartime instructional needs came the realization that words alone would not suffice to bring about the clarity in learning upon which so much depends. The result was the development of a variety of visual aids by various divisions of the military services which have not only made instruction more speedy and accurate, but which also have made obsolete some of our teaching practices and assumptions. Dr. Thomas points out the necessity of modifying instructional practices in postwar teaching so as to capitalize more fully on the first-hand experiences and perceptions which the pupils can derive from visual aids. "The institutions engaged in teacher education will have obligations imposed by such developments, but it will be upon the teachers now in service that the responsibility will rest for making those readjustments essential to the successful utilization of resources which promise a challenging adventure in the improvement of teaching."

Walt Disney, in a statement written especially for the symposium, foresees that "films will be a great means of education . . . but their real worth will be established only when the men who teach join with the producers in presenting their thoughts in a way which will hold their classes—in other words, educate through entertainment."

Digests of the five symposium articles follow:—

**Animated Cartoons Join the Teaching Staff**, by Franklin R. Thomas, a member of the Disney staff before entering the Armed Forces, is a significant interpretation of the effectiveness of cartoon characters in terms of the psychology of learning, based on the experiences of the Motion Picture Unit of the Air Forces, to which the author was assigned to plan and supervise the animation in training films.

The article describes the planning, construction, growth, and instructional presentation of the animated film. In the first productions, animation was used only to clarify charts and diagrams and all picture technique was eliminated. But it was soon discovered that this method of presentation was too dull to be effective, so some picture technique had to be put back into the product. The ideas had to be made dramatic and exciting enough that the men would want to learn about them. It was found that repetition of the main points in the training film from a cartoon standpoint made those points more forceful, and occasional injections of cartoon sequences, whether for humor or mere relaxation, eliminated mental fatigue and its accompanying blind spots for the retention of facts. Within a year, the diagrammatic film had "grown up." It was being used in a variety of different ways, each use calling for a different technique in its presentation, but the basis for all later refinement had been achieved.

While the units in the service had been working on the problem of the diagrammatic film, the larger studios had been filling Government orders, many of which specified character animation. The value of this type of production

was recognized quickly and character animation made its entrance into the straight training film. Because of restrictions on time, money and personnel, the possibilities of the cartoon could not be fully experimented but the production unit of the Air Forces felt it could be used to great advantage: (1) in diagrams; (2) to provide humor as "lessons learned with a laugh are seldom forgotten," (3) to give interest and freshness to ideas so old and well-known they are virtually forgotten, (4) to achieve a point more directly through caricature and satire, (5) to stimulate imagination, through fantasy, to a fuller grasp of new ideas.

"It is still too early either to give a complete appraisal or to establish rules for the use of the animated cartoon in training films," declares the writer. "We are convinced that its potential powers have not yet been realized . . . In spite of the growth that has been brought about by the war and its vast training program, it will be the postwar era that will bring fullest realization of these potentialities." He predicts a small-scale production of educational films using animation after the war, but these necessarily will be low-budget pictures, limited in scope, until a market for them has been established. The larger studios, he reports, believe that enough educators already have become interested in this type of teaching film that a program of major proportions will be started very soon but they admit that it would have to be done through endowment funds or with some kind of federal educational grant. Before there can be any large scale production in the postwar world, he also points out, there will have to be a certain amount of standardization in at least the basic subjects of the curriculum. "Perhaps the most effective developments will require some cooperative planning agency in which educator and animator will collaborate."

Mr. Thomas urges the production of motion pictures which will develop desirable attitudes and ideals. "In such an undertaking, the use of animation has some distinctive values. It can touch an abstract quality or idea with its creative magic and give it a warm personality. . . . The appeal of the characters of animation is international and universal. . . . Such films could bring a new era of enlightenment and common understanding."

**Visual Aids Expedite Navy Training Program**, by Lieutenant Francis W. Noel, in charge of the Bureau of Naval Personnel training aids utilization program, is concerned chiefly with the duties and responsibilities of the Navy's training personnel. A Joint Board of Review, comprised of officers from both the curriculum and the Training Aids Sections, appraises and selects suitable aids to implement training, after the curriculum has been planned. If suitable aids are not available, the Board recommends their production and counsels on the educational aspects involved. To provide the personnel designated as audio-visual utilization officers, the Navy has chosen leaders in the audio-visual field who meet the qualifications. Before being assigned to permanent duty, each officer is brought to the Bureau of Naval Personnel for orientation. When they leave the Bureau, they are free to develop a program meeting the particular training needs of the activity to which they are assigned. Their primary job is to work with training officers and instructors for the best utilization of the aids. This involves (1) familiarizing them with equipment and materials, (2) helping them to select and procure appropriate aids specific to their needs, (3) helping them to plan their use of the aids, (4) demonstrating good utili-

YOU Can be Assured that  
**Erpi Classroom Films**  
will continue to maintain their present  
position in the field of education

WITH the acquisition of Erpi Classroom Films by the  
Encyclopaedia Britannica, itself affiliated with the  
University of Chicago, it was decided to leave all estab-  
lished Erpi policies unchanged—because Erpi Classroom  
Films had already earned, among educators, a reputation  
for factual dependability and instructional excellence.

We believe that the eminent and distinguished men  
who comprise the Board of Directors of Encyclopaedia  
Britannica Films Inc. will be sufficient assurance to our  
many friends that Erpi Classroom Films will not only  
continue to maintain established standards, but also will  
open new horizons in the field of education.

zation procedures, and (5) assisting in appraising techniques and results.

The pattern of use recommended to all naval activities is outlined in the article. A staff of approximately one hundred utilization officers is helping instructors to put these techniques into practice. An evaluation study is now in progress in the Navy Department to discover the most successful methods of utilization and how audio-visual aids can be made even more effective. The results of this study should be important to the schools of America in the future.

**Planning for the Navy's Training Films**, by Reginald Bell, on leave from Stanford University to serve as educational specialist in the Training Film Branch of the Bureau of Aeronautics, emphasizes the extensive and intelligent planning that is involved in the production of aviation training aids. After making certain films which did not prove entirely satisfactory as the program developed, the Aviation Training Division recognized that the place to outline the needs of the field was not at staff headquarters in Washington, but at the school where instructors were being trained. "It was logical to assume that what tools were needed could be decided best by those who would use them." The locale of further planning, therefore, was shifted to the Flight Instructors School.

The commanding officer of the school reported the list of films needed to implement the flight training syllabus to the Training Command who requested that Aviation Training arrange for the films' production. The superintendent of the Flight Instruction School and the staff flight training officer of the Training Command were appointed technical advisers of the films and consulted with production officers from the Training Film Branch of the Bureau of Aeronautics for the purpose of writing production outlines on the films. The films were then ready to go into production.

**Slide Films in the Navy Training Program**, by Jay D. Dresser, project officer in the Training Film Branch of the Photographic Division of the Bureau of Aeronautics, which supervises the production of all Navy training films, outlines steps followed in the production of each film. A project supervisor, who has had a background of film production work, an education officer, and a technical adviser, assigned by the organization requesting the film, plan the initial outline of each picture, these three officers determining the specific purpose of the film, its contents, and the best method of presentation.

In making a slidefilm, still photographs are made of the subject and mounted on cardboard frame cards. Printed titles and other art work are added to the photographs, which are then photographed in sequence on 35mm film.

Slidefilms have become an integral part of many Navy training courses, covering such subjects as office procedures, seamanship, elements of electricity, semaphore signaling, shipbuilding and maintenance and repair of aircraft, gunfire control equipment and other highly complicated machinery. Besides shortening the training periods and standardizing operations, use of the slidefilm makes continuous training possible. They can be forwarded to units in the field to keep men informed of new developments in equipment and tactics. The search for more effective means of visualizing subjects has led into the production of third-dimensional films, the psychological use of color and other advanced developments.

**The Use of Nonphotographic Aids by the Navy**, by William Exton, Jr., in charge of planning and production in the Training Aids Section, Bureau of Naval Personnel, reviews the extensive list of nonphotographic aids—two-dimensional and three-dimensional—which have contributed substantially to the Navy's training program. An outstanding example of graphic media is the set of 560 charts illustrating the Diesel engineering training curriculum, which have been hailed by educators and manufacturers as a notable contribution to the progress of technical illustration. This elaborate project involved exhaustive planning and an extensive production program. Posters are made to illustrate procedures. One of these, dealing with the bowline, has enabled persons who had never before seen a bowline, to tie it correctly in less than one minute. As with the films, these training aids are the product of careful, collaborative thought by a number of qualified individuals.

Three-dimensional aids are employed to simulate an actual object or item of material. One of the devices in this category is a small cardboard blinker for the training of signalmen, manufactured at a cost of 3c apiece. Another aid is the "mock-up," which is an enlarged reproduction, contrastingly colored, of equipment parts.

In developing training aids the Navy has pioneered beyond civilian precedent, and the writer expresses the hope that valuable lessons will be learned by the educational world from the Navy's experience which will result in substantial benefits to the standards and effectiveness of civilian training in the years to come.

**Learning Through the Senses**—Leland S. March, Principal Westwood High School—*New Jersey Educational Review* 17: 162 March, 1944.

A short but pointed article to remind teachers that facts taught in a dynamic manner are better learned and develop better attitudes in the learner. Audio-visual aids, when properly used, provide a very effective learning situation. By comparison traditional classroom techniques with tepid stimuli and monotonous responses seem outdated.

### Storage Problems in Audio-Visual Aids

(Concluded from page 160)

flat or stood in a corner; their unwieldiness increases if they are to be used frequently. Then too, if an instructor gave a quiz the charts had to be turned over so that wandering eyes could not see the answers. The very aids which helped at one time were sources of distraction at other times.

The author, having visited the Armored Force School at Fort Knox, Kentucky, had the answer. That excellent school had overcome the same problem by use of holders similar to those illustrated. These simple display racks have counter weights which pull any desired chart from the well in an instant. When the instructor has finished with the chart, it can be slid back with little effort. The frames can, of course, be used anew when the charts are changed. Since plywood was used in construction with inch pine braces, their weight is not a burden. Casters can be used with these racks and they can be moved from room to room with ease. Overall dimensions of the holder are sixty-eight inches by eighty-four inches by eighteen inches.

These problems of storage are small but unless solved satisfactorily they prevent a visual aids program from doing its part effectively. If the ideas are adaptable to your situation, don't hesitate to use them. They are merely improved instruments in hands working for victory.

## "Fit to Live and Fit to Fight"

TO show what some schools are doing to prepare students for the strenuous life of today, a motion picture of four reels, *Fit to Live and Fit to Fight*, has been produced by the Bureau of Visual Instruction of the University of Iowa Extension Division, under sponsorship of the Iowa State Department of Public Instruction. It was filmed by John Hedges, Acting Director of the Bureau. A report of the film written by Eric C. Wilson, Editor, University of Iowa News Service, follows:

"This 16mm. film, now being distributed, was made in May, 1943, in thirteen representative Iowa high schools, and is designed as an honest sampling of the physical education program in such schools.

"It is pointed out that this sampling of a program does not necessarily represent the *best* program that might be done in high schools but is what is *actually* being carried on. The program is a good one and one which is suggestive as to what can be done in many schools.

"All scenes are unrehearsed and only physical education activities are depicted. No pictures were made of the competitive sports program, on the theory that there is much more familiarity with this interscholastic program than with the new type of physical education work. It is expected, however, that sports sequences will later be included and that a sound track will be added.

"Thirteen Iowa schools cooperated in the project. These were Fairfield, Keokuk, New London, Burlington, Ottumwa, Centerville, Mt. Ayr, Creston, East and West Waterloo, Boone and North and East Des Moines.

"In the narrative script for the film, written by Prof. Charles H. McCloy, Research Professor of Anthropometry and Physical Education at the University of Iowa, he says, the program needs to be regular and the time allotment should be adequate so that the effects will be cumulative. The exercise must be progressively more strenuous in order to insure that the pupils develop sufficient strength and endurance and speed to do better the tasks of each day, to carry through the work of the day and evening without fatigue, and to develop a reserve of strength and energy for emergency tasks of our time."

"Let us not, however, as we look at this picture, think only of the activities of a physical education program. The activities simply are a means of insuring that the boys and girls will be healthy and intellectually and emotionally well-adjusted."

The picture includes scenes of work for boys and girls such as guerrilla forms of combat, calisthenics, boxing, obstacle racing, rope-skipping, tumbling, dancing, swimming, track and field events, and games in the gymnasium.

Consultants for the film, in addition to Prof. McCloy, were: Dr. Paul W. Brechler, Instructor in Physical Education for Men and Head of Physical Education for boys at University of Iowa and University High School; Dr. Elizabeth Halsey, Head of the Department of Physical Education for Women; Miss Ella Small, Assistant Professor in the Department of Physical Education for Women, both of the University of Iowa; and H. J. Steffey, Supervisor in the Iowa State Department of Public Instruction.

(Below) An obstacle course hazard.

(Navy photos)

I want

this...

**THE STORY OF ALEXANDER GRAHAM BELL.** Don Ameche, Loretta Young, Henry Fonda. Out of the stirring past of this great nation emerges the story of Alexander Bell and the telephone—which in his youth he invented—a story as real as the telephone itself—a story that symbolizes the mission of America.

and this...

**STANLEY AND LIVINGSTONE.** Spencer Tracy, Nancy Kelly, Sir Cedric Hardwicke, Richard Greene. A great picture (three years in the making in the actual African locale) of the greatest adventure of the foremost newspaper man of all times.

**T**HESE three magnificent Twentieth-Century Fox feature films are distributed exclusively in 16mm by FILMS INCORPORATED. Like other titles in our famous School List, they will be in great demand this fall—a demand accentuated by the present scarcity of raw stock and the inadequacy of printing facilities.

By making your plans, now, to screen these and other outstanding feature-length programs in your auditorium as a regular part of your curriculum, you will be better able to get the films you want when you want them. Reservations are not binding on your school—they simply aid us in arriving at a schedule best suited to your needs. Study Guides, for each feature picture, which integrate classroom discussion following auditorium showings, will also be reserved for you without obligation.

Feature-length programs are a new dimension in education! Has your school the best that major studios can offer?

and this...

**YOUNG MR. LINCOLN.** Henry Fonda, Marjorie Weaver, Alice Brady, Arleen Whelan. This is the story of Lincoln that has never been told—of a young man known to everybody in the backwoods town of Springfield, Illinois... a student and lawyer whose strength and wit were famous.

### QUESTION BOX ON SCHOOL FILM PRODUCTION

**Question:** I would like to organize a motion picture production club in our junior high school. (1) What is the best way to start? (2) What could be considered the minimum essential equipment? (3) How can such project be financed? (4) Commensurate with the abilities and interests of junior high school students, what film subjects shall we produce?

**Answer:** Since there is no one set way to start a motion picture production project, it is suggested that the mere announcement of the planned organization of such a club during an assembly program, in the school paper, or through formal notices sent to each class, would bring more than the maximum number of students needed for the efficient running of your activity. Also you can take advantage of the psychological principle, "strike while the iron is hot", by timing the start of the project so as to make immediate application of the lessons on light and photography just when your general science classes have reached the highest pitch of enthusiasm for those topics. I haven't found a class, yet, that didn't bubble over with excitement and activity whenever pinhole and other cameras and their accessories were put to practical use in the classroom. The important thing here is to keep these flames of enthusiasm fanned. Soon enough every charter member will become a torchbearer for future additions to your club.

Once the club is organized, committees can be formed to study and become expert in the use of the camera, lighting, properties, script, art, and editing. Each group, in turn, can teach the others all the tricks, old and new, of its specialty. A collection of books, pamphlets, prepared lectures and slides should be available at all times for reference and research. A great deal of this material may be obtained on loan basis or free from the manufacturers or distributors of photographic equipment. Many students will want to contribute some of their own materials to build up such a library of information.

As far as equipment is concerned, the following may constitute the list of minimum essentials: 1 motion picture camera, preferably 16 millimeter, having a dismountable lens at least F 3.5 opening; 1 tripod; 3 reflectors, preferably clamp-on type; 3 or more photoflood lamps, number 2; 1 yellow filter; 4 or 5 rolls of black and white film, 100 foot lengths; 1 reel to hold 400 feet of film; 1 can to hold 400 foot reel; 1 splicing set; 2 or 3 extension cords, rubber insulated; 2 triple sockets.

A few words about the equipment: Notice that the camera recommended is the 16 mm. variety. The reason for that is that your school probably possesses one or more 16mm. projectors on which you will most likely run your films. The removable type of lens is suggested because

735 MARKET STREET • SAN FRANCISCO

some day you may want to add wide angle, telephoto or faster lenses.

No matter how confident one may feel about his ability to hold the camera steady, the fact that more than one person will be using that instrument demands that the camera rest on a firm tripod to insure sharp, level pictures.

Clamp-on reflectors are easier to handle, take less time to set up, and can be tilted at the proper angle just as well as the more expensive, cumbersome types. Whenever you have to use more than three number 2 lamps be sure to check the amperage of your fuse. The ordinary number 2 photoflood draws 4.4 amperes. The average house or schoolroom fuse carries 15 amperes—just enough for three of those lamps. Of course it's wiser to use as many different outlets as possible.

The yellow filter is an important accessory for outdoor filming, especially for distant shots with sky and clouds for background.

Black and white film is best for beginners, since errors in exposures are compensated to some degree by most processing laboratories. No doubt an exposure meter is a good investment, if obtainable these days. However one can get pretty accurate results by following carefully the printed instructions on exposure which come with every roll of film.

As for financing such project your best bet is to throw this problem right into the laps of your enthusiastic clubmembers. I am sure that, among the suggestions you will get, will be any or all of the following:

1. Appropriation of funds by the school General Organization.
2. Put on school plays, dances or movies, charging admission.
3. Seek assistance from parents association.
4. Gifts from graduating classes.
5. (later on) Charge few cents admission fee to see club produced films.

Film subjects that will have the most appeal to the junior high school students are films in which they themselves play the leading parts. Your first film will probably be a kind of public relations film—a subject in which students are displayed at their best, the daily school routine. If you want to show action, not merely posing, be sure to photograph them in subject classes where activities are in full swing—the gymnasium, the swimming pool, the athletic field, shops, laboratories and domestic science rooms. After that usually comes a "March of Time" or School Newsreel. From then on your students may want to put on playlets, but again make sure that there is plenty of action, not mere lip motion. Finally you will reach the stage when you will become surfeited with routine subjects. You will then enter the phase of producing instructional films—films that show the how and why of things, proper ways of swimming, life saving, carving a piece of wood in the shop, yes, even carving a turkey (if you can get one).

D. S.

## The First Fifty Years

AS THIS issue appears the theatrical motion picture industry embarks upon a semi-centennial year of celebration to commemorate the opening, April 14, 1894, at the Holland Brothers Kinematoscope Parlor in New York, of the first film show in the world. Residents of the non-theatrical field of motion pictures may well join heartily in the hosannas. The 1894 demonstration, while involving some simple vaudeville turns in subject matter, derived no importance from them; the entire significance lay in an educational proof that photographic living pictures were possible and practicable.

But quite apart from any non-theatrical distinction, those who are disposed to draw that discriminating line may still celebrate the anniversary in fine fraternal spirit for, without a sizeable, matured theatrical film industry, the non-theatrical side could not possibly have attained in the same period its present stature, and it would quite certainly now be without its efficient existing technical equipment. Moreover, the non-theatrical and theatrical growths have identities in the sap, as in the roots, bark and branches of the same tree.

The pseudo-scientific analyses of animal movements, made by the singular Edward Muybridge in the late '70s and '80s, were educational items produced with photographic cameras before Edison invented his Kinetoscope, and were, indeed, his acknowledged inspiration; but their development to a useful application was carried through wholly by the commercial interest of Edison and his associates in amusement aspects. The first great supply of school films was organized by Charles Urban out of his theatrical productions in England and France about 1903; the first notable attempt to introduce motion pictures into American schools as classroom apparatus, in 1910, came with George Kleine's offer of more than a thousand selected theatrical reels; the long familiar Pathe productions were originally theatrical; the Bray subjects were nearly all theatrical first; the Pathescope Library, the Victor Animatograph Library and many more well known collections have stemmed from theatrical features, newsreels and screen "magazines." The best training films of present global war are being produced by men and women experienced in theatrical techniques and expecting at the end of the duration to return to studio positions, said techniques including arrested and accelerated screen motions and the general magic of screen animation, with the theatrical Walt Disney as chief practitioner.

As the "golden wedding" year goes on there will inevitably be many theatrical observances, and there will be point (within the modest limits of wartime economies) in having the non-theatrical field organize its own particular celebrations, too, if only to remind those who hold the large brass keys to visual instruction that there has accumulated for their endeavors a respectable and even impressive tradition. Upon the forgotten pioneer efforts which they would thus uncover, they might proceed into the latter half of the

# SCREENS

### No Compromise on QUALITY

Because of Da-Lite's policy of refusing to use substitute materials, you can always be sure that *any* Da-Lite model you select will be carefully made and durably constructed. The quantity may be limited because of the War Production Board's need to conserve metal, but the *quality* of Da-Lite equipment will never be sacrificed.

### No Compromise on SIZES

The completeness of the Da-Lite line makes it easy to find the right screen for every projection requirement.

### No Compromise on CONVENIENCE

Da-Lite Screens have always been distinguished for their safety and ease of operation. The Challenger, with its exclusive slotted square tubing and patented, smooth-operating inner-locking device, is the only screen that can be adjusted in height *without* separate adjustments of the case or fabric. This prevents pulling the fabric from the roller when setting up the screen or raising it.

For *lasting satisfaction*, specify DA-LITE when you buy screens. Ask your local office of the War Production Board for the latest regulations governing the sale of screens under W.P.B. order L-267.

### The Dutch Tradition

(Brandon Films, Inc., 1600 Broadway, New York 19, New York) 27 minutes, 16mm, sound. Produced by the Netherlands Information Bureau and the National Film Board of Canada. Sale price \$22.74. Apply to distributor or Motion Picture Bureau of the Office of War Information for rental sources.

Introductory scenes show the familiar tulips, windmills, and wooden shoes of Holland. The film then passes from these familiar characteristics and portrays the fundamentals of Dutch moral strength and the traditional persistency in united effort for mutual progress through mutual endeavor. It shows that the emigrants from Holland to Michigan have influenced American ideals through their industry, craftsmanship, and high spiritual standards. Through their unflinching devotion to a common cause the Dutch drained the Zuyder Zee and thus created new farmlands to meet the needs of an increasing population.

Later when the Nazis invaded Holland, whose Hague had been the center of international arbitration, the Dutch opened their canals to flood the Nazis, who circumvented this tactic by use of air-borne troops. In the same spirit they frustrated Japanese attempts at negotiating for the wealth of the Indies and even before Pearl Harbor declared war on Japan. Apparently their indomitable determination has not been thwarted by the defeat of their small Navy and Air Force which was no match for years of Japanese armament.

The Dutch colonial policy of development in control of the Netherlands East Indies is shown as industry and education are introduced and the wealth of the islands is preserved rather than exploited. Likewise in the Dutch West Indies, the natives are free to develop their country and to contribute to the Allies oil refining and bauxite for planes.

The unyielding prosecution of war against aggression is shown as the Netherlands people who have escaped from Holland are active all over the globe—Dutch flyers train in the United States to return to Pacific bases, Dutch seamen are active in the Allied Merchant Navy, and the Dutch Underground helps direct Allied planes to their targets.

The film concludes as the commentator states that the Dutch are following their Queen in a tradition of stubborn resistance to achieve the Netherlands Commonwealth in which they will work together as they are working together now for total victory.

**Committee Appraisal:** A kaleidoscopic treatment of the people of Holland and the Indies which provides a background for better understanding of the Netherlands and its international

relations. Because the film covers many facets of the subject, some topics are not fully developed and require supplementary treatment by the teacher or leader. Suitable for use by classes in geography, commerce, and social studies, and by adult groups interested in the role Holland and the Indies are playing in the present war.

### Basic Typing Methods, Part I.

(Castle Films, 30 Rockefeller Plaza, New York 20, New York) 35 minutes, 16mm, sound. Sale price \$23.76. Produced by the Bureau of Aeronautics for the Division of Personnel, Supervision and Management—Navy Department. Apply to producer for rental sources.

The film opens with a short historical sketch of the typewriter from 1868 to the present time. Various machines that are being used now are shown and their differences pointed out.

Miss Lenora Fenton, expert typist, demonstrates and explains the principles of correct typing. The importance of good posture at the machine is stressed, and the position of body, fingers, hands, wrists, and arms is shown. Miss Fenton demonstrates the fundamentals of the keyboard and proper technique of finger stroking and shows contrast between the good and bad. Exercises to develop finger precision and agility are given. An explanation is given of the use of the tabular key, backspace, line space operator, paper guide, paper bail, and various other parts of the machine. Method of inserting, adjusting, and removing paper and carbon packs from machine is shown.

The film closes with the admonishment that speed in typing comes with "intelligent and purposeful practice."

**Committee Appraisal:** One of a series of eight office practice films produced by the Bureau of Aeronautics. Other titles are *Maintenance of Office Machines; Basic Typing Machine Operations, Part II; Advanced Typing Shortcuts, Part I; Advanced Typing Duplicating and Manuscript, Part II; Machine Transcription, Machine Operation, Part I; Machine Transcription Trans. Tech., Part II; Take a Letter, Please; How to Dictate*. Teachers of commerce, both on the secondary and adult level, should find these films valuable aids in teaching typing and shorthand skills. The committee felt that teachers might criticize the length of the films and the inclusion of many details.

### Fundamentals of Diet

(Erpi Classroom Films, Inc., 1841 Broadway, New York City) 11 minutes, 16mm, sound. Sale price \$50.00 less 10% educational discount. Apply to producer for rental sources. Discussion guide available.

The introduction divides animals into three classes in respect to their food habits—carnivorous, herbivorous, and omnivorous. After man is identified with the omnivorous group, the classes of foods which he has learned to eat are then shown. Emphasis is placed upon the fact that many of these foods nature has provided for her young, both in plants and in animals.

Consideration is next given the special dietary factors that must be furnished by the diet: such as energy, protein, mineral nutrients, and vitamins, which are needed to build and repair muscle and other tissues, to build bones and teeth, to provide for growth, and to keep the body machine in good working order. Pictures showing children carrying out feeding experiments as class projects indicate the results of the lack of diet and vitamin deficiencies such as the need for vitamin C to pre-

(Concluded on page 180)

This monthly page of reviews is conducted for the benefit of educational film producers and users alike. The comments and criticisms of both are cordially invited.

Producers wishing to have new films reviewed on this page should write L. C. Larson, Indiana University, Bloomington, Indiana, giving details as to length, content, date on which the film was issued, basis of availability, prices, producer and distributor. They will be informed of the first open date when the Teacher Committee will review the films. The only cost to producers for the service is the cost of transporting the prints to and from Bloomington. *This Cost Must Be Borne By The Producers.*

# The Little Red Schoolhouse keeps right on growing up

Years ago the Little Red Schoolhouse grew into modern consolidated schools ... and the growing hasn't stopped!

Reliable estimates say that new school construction will account for 30% of the postwar non-residential building.

Changes in curriculum ... in emphasis ... in teaching methods ... are calling *now* for new school-planning thought.

And high on the list of new educational demands is the extension of facilities for visual education in tomorrow's schools.

Teaching, itself, is only one of the jobs Filmo Cameras and Filmosound Projec-

tors can do for tomorrow's schools. The school is destined to become an increasingly vital civic center ... and this function is ideally served in countless ways by Bell & Howell Motion Picture Equipment.

School executives who are planning *now* for finer schools tomorrow, are invited to ask for information about improving facilities for visual education.

 4247 Piedmont Ave., Oakland 11, Calif.

vent scurvy which is illustrated by a simple feeding experiment with guinea pigs.

The major classes of foods in an ideal diet and their special contribution to body welfare are portrayed. The film divides foods into the seven groups accepted by The Nutrition Office in Washington. The groupings are presented pictorially by showing many foods so classified, and then individual items being selected to emphasize the idea of an intelligent selection actually being made.

The film ends with suggestions for substituting for foods which are not available—if fresh milk cannot be secured, if wholewheat bread is not available, if eggs or meat are too expensive or are not available, if fresh fruits cannot be purchased or if butter is not available.

**Committee Appraisal:** Treats the groups of foods needed in the daily diet, the functions of the various groups, the wise selection of foods, and the possibility of substituting. As pointed out by the educational author, Dr. George R. Cowgill, Yale University School of Medicine, "Authorities can differ as to just how many groups of food one should consider from a practical standpoint; however this need not lead to rejection of the basic idea of such a classification as a means of facilitating the practical application of our knowledge of foods and food

values." Student and adult groups interested in nutrition should find this film helpful in presenting an over-view of the subject.

### Distillation

(British Information Services, 30 Rockefeller Plaza, New York City 20) 13 minutes, 16mm. sound. Sale price \$14.00. Apply to producer for rental sources.

Through laboratory demonstration, this film explains the method of separating the various products found in crude oil. Much of the explanation is done by means of animated diagrams. Atoms of hydrogen and carbon are represented by white and dark balls. Each carbon atom has four arms; each hydrogen atom has one arm, thus representing the valence of each. A combination of atoms is known as a molecule. Diagrams of a few of the possible combinations of carbon and hydrogen atoms are represented by white and black balls forming chains, rings, and unions of both.

Crude oil is composed of many different kinds of molecules. In order to secure the different products, it is necessary to separate each mixture. Since liquids have different boiling points, the mixtures are separated by distillation.

To explain distillation a clear liquid is mixed with a dark liquid to which some crystals have been added. Heat is applied. At one temperature, the clear liquid evaporates and is condensed. As the temperature rises, the dark liquid boils, evaporates, and is condensed. Only the crystals of the original mixture are left in the container.

Distillation is used to separate the mixture of hydrocarbons in crude oil. The suits in a deck of cards are used to represent the groups of hydrocarbons in crude oil. Each group is called a fraction. The object of distillation is to separate one fraction from the other. A diagram of the old-fashioned bench-still is shown; oil flows from one still to the next as the heat under each still is increased. The vapors formed at the various temperatures are condensed by cold water, thus isolating each compound from the crude oil mixture.

A picture of a modern fractionating tower is shown and a diagram explains the construction of the tower. The crude oil is heated; the vapors rise in the fractionating tower and the residue is drawn off. As the vapors ascend through more and more intense temperatures, each product is condensed at its particular boiling point and the product is removed. All the products are shown as they are ready for the consumer.

**Committee Appraisal:** An excellent use of animated diagrams to explain the process of distillation of crude oil. Should be helpful to teachers of chemistry and vocational training in adding concreteness to an abstract subject.

### The First Fifty Years

(Concluded from page 177)

century with more assurance and perhaps with some saving in duplicating efforts.

Charles Urban's theatrical education department in 1903 was headed by Frank Percy Smith, a trained London school teacher; the George Kleine offer to the New York schools was sponsored by the People's Institute and encouraged by top officials in the metropolitan school system; Lincoln & Parker, of Worcester and Boston, who made their valiant fight to produce and to distribute films expressly for schools—a project extending the educational film enterprises of Thomas A. Edison's theatrical company—were men who both had been trained and experienced in pedagogy; and Harley Clarke's foundation of the Society for Visual Education in the '20s fairly scintillated with internationally known names of leading educators.

Details concerning these and other pertinent facts have been given in the non-theatrical history which has been serialized in the pages of this magazine since September, 1938.

**DVI (Zone II) New York Meeting**

WHEN the annual convention of the American Association of School Administrators was rearranged to provide for sectional rather than national meetings, in view of the exigencies of transportation and hotel space, the Department of Visual Instruction program was arranged on the same basis. In New York City, on the afternoon of February 23, a timely six-unit program on the theme VISUAL EDUCATION TODAY AND TOMORROW was presided over by Dr. E. Winifred Crawford, DVI (Zone II) president. For the first time in her many years of school service, it was her pleasure to introduce her own superintendent of schools, Dr. A. L. Threlkeld, of Montclair, New Jersey. He made an interesting, favorable appraisal of the contributions and future of visual aids.

Three of the units were excellently illustrated by means of talking motion pictures. Lt. Lyle Stewart, of the Audio-Visual Training section in the United States Navy, laid particular emphasis on the utilization of visual aids in the armed forces. Short sections from three widely different sound films were given in connection with his paper, and the layout of his department was shown by means of projected still pictures.

Floyd E. Brooker, of the U. S. Office of Education, put forward a whole series of challenging questions that grow out of the tremendous war-borne expansion of the use of visual aids for education at all levels and in all subject matter areas. His talk was illustrated by the projection of a short section of a new USOE release, "THE SLIDE RULE."

Julien Bryan, producer for the Coordinator of Inter-American Affairs, discussed some of his experiences in implementing the good neighbor policy with a movie camera, and showed two excellent new sound films, "MONTEVIDEO FAMILY" and "HIGH PLANE."

L. C. Larson, of the University of Indiana, reported on current status of 16mm. distribution at the OWI, and on the activities of the "National 16mm. Advisory and Policy Committee". Dr. Lucile Allard, president of the Metropolitan New York Branch of the DVI, summarized the discussions.

In attendance and interest, the sectional meeting equaled the best of the national meetings held in the past. An excellent informal dinner was held at the Town Hall Club. It was presided over by Miss Rita Hochheimer, and was featured by the introduction of prominent visual aid workers from all parts of the country. A preview of the new Warner theatrical feature, "ADVENTURES OF MARK TWAIN" concluded the program.

The commercial exhibits, both at New York and Chicago, were of necessity limited in space and in display budget. Nevertheless all of the well-known names, and some new ones, were well represented.

## News and

### Eastman Classroom Films to University of Chicago

President Robert M. Hutchins announced on April 12th that the University of Chicago has accepted a gift of the Eastman Classroom Films, with its vast library of silent educational movies, from the Eastman Kodak Company. The acquisition comprises some 300 reels of film for exclusive classroom use and represents an investment of more than a million dollars. The new library will be combined with the 200-reel sound film collection of Erpi Classroom Films, recently acquired by the University. Like the Erpi set, the Eastman films will be distributed by Encyclopaedia Britannica Films, Inc., subsidiary of Encyclopaedia Britannica, Inc.

In announcing the latest gift, Mr. Hutchins stated: "Britannica Films is now in such a commanding position in the field as to have a clear responsibility for the continued development and expansion of this important educational tool." Wm. B. Benton, chairman of the Board of Encyclopaedia Britannica, Inc. and vice-president of the University of Chicago said: "With Erpi Classroom Films and now the Eastman films, Encyclopaedia Britannica Films, Inc., is the distributor of the only library of films designed for classroom use. The University now is in an ideal position to take leadership in the entire area of visual education." Mr. Benton added that plans are being made for expanding facilities and that Stephen M. Corey, professor of education psychology at the University, is on leave for full time work on production plans.

### Commission Formed to Study Educational Film Needs

Dr. George F. Zook, president of the American Council on Education, has announced the formation of a Commission on Motion Pictures in Education, consisting of six educators, whose duty it will be to make a survey of the uses of film in schools and colleges and to plan for the production of films in fields of study where new educational films are needed. Particular attention will be given at first to a series of films related to post-war reconstruction.

This project is being financed by a substantial grant from eight major Hollywood producers, namely, Columbia, M-G-M, Paramount, RKO, 20th Century-Fox, United Artists, Universal and Warner Brothers. Members of the Commission are: Mark A. May, director of the Institute of Human Relations, Yale University, chairman; George S. Counts, director of the division of foundations of education, Teachers College, Columbia University; Edmund E. Day, president of Cornell University; Willard E. Givens, executive secretary of the National Education Association; Monsignor George Johnson, general secretary of the National Catholic Education Association; and Dr. George F. Zook.

A preliminary survey on the needs for new motion picture material, and other studies in the evaluation of existing educational films, have been made by the American Council on Education. These studies, Dr. Zook declared, indicate great need for new films, par-

# Notes

ticularly at the elementary school level and at all levels in English, history, guidance and vocational areas.

The Commission plans to set up a national board of advisory consultants, composed of specialists in the various teaching and film fields. An office and staff will be established for the carrying out of this study.

## New WPB Priority Regulations on Photographic Equipment

The March issue of NAVED News carries a report on Priority Interpretations, by Richard F. O'Neil, Visual Education Service, Inc., which sets forth some of the most important changes in the latest amendment to L-267.

According to the new Regulation, restrictions are removed on delivery from manufacturer of any item of photographic equipment of \$10.00 or less (including Federal Tax), and on delivery or repair or replacement parts.

Manufacturers may deliver photographic equipment and accessories: (1) To fill a nonpreferred order bearing an AA-5 or higher rating; (2) as authorized by the nearest Field Office of WPB on 1319 Application.

Nearly all organized commercial business operates under CMP Reg. 5 which, within its ceiling of \$500, authorizes ratings from AA-1 to AA-5 for Maintenance, Repair and Operation (MRO). This means that all established business may obtain any item of photo equipment (except prohibited box cameras and 8mm items) priced above \$10 and below \$500, on their MRO ratings, without filing a 1319 application.

Nearly all Institutions—Governmental, Educational and Religious, Hospitals, Welfare Organizations, and other nonprofit associations—operate under CMP Reg. 5A, which still has a \$100 ceiling, and also authorizes MRO ratings from AA-1 to AA-5. Such Institutions, however, must still apply on the new 1319 forms for all items priced above \$100, such form to be mailed to the nearest Field Office of WPB.

## Rare Pictures Telecast

New York's estimated television audience of 40,000 had a photographic peek at modes and manners of the past when some rare photographs were telecast for the first time February 9 at Station W2XWV, New York, during the Storm Agency Show, a weekly television performance. Dr. Otto Bettmann exhibited and commented upon the slides, which represented some of the choicest photos in his vast collection. Dr. Bettmann has achieved considerable prominence since 1936 when he entered this country from Germany laden with the world's largest collection of photographs depicting the progress of civilization. He had amassed his array of pictures, totaling about 10,000, while head of the Rare Book Department of the Berlin State Art Library. The collection is so thoroughly indexed by Dr. Bettmann that a picture on any subject can be located quickly.

## Current Film News

■ **CASTLE FILMS**, 30 Rockefeller Plaza, New York City, have prepared the following two companion reels picturing recent sensational action in the battle of the Pacific:

**Salute to the Navy**—a stirring tribute to America's navy and to the men who are fighting the war on, under and above the Seven Seas. This film records the incredibly swift growth of the world's greatest navy, its traditions, training and gallantry, and reveals its power in thrilling battle scenes taken from the deck of a carrier during a raid in the Marshalls.

**Yanks Invade Marshall Islands**—an exciting, tense combat picture filmed under fire by daring marine, army and navy cameramen from land, sea and sky. Heavy naval bombardment of Jap strongholds and sweeping onslaughts of assault craft result in another mid-Pacific American victory at Kwajalein and Roi.

■ **BELL & HOWELL COMPANY**, 1801 Larchmont Ave., Chicago, have acquired for their Filmosound Library the theatrical features:

**Pot o' Gold**—8 reels of light-hearted nonsense intermingled with hit tunes. Happy-go-lucky nephew of a rich manufacturer of health foods finds romance and adventure on the air waves. In the

cast are James Stewart, Paulette Goddard, Horace Heidt and Charles Winninger.

**Who Done It?** (Universal production)—a travesty on murder-mystery dramas with Abbott and Costello as amateur detectives.

**Three Centuries of Massachusetts**—a notable historical film, produced by Harvard University and narrated by Prof. Albert Bushnell Hart, has been sold to the Bell & Howell Filmosound Library. The film is at present eight reels in length, and will be cut down and re-edited by the new owners. Meanwhile the original eight-reel version continues to be available through the same source.

■ **PICTORIAL FILMS, INC.**, RKO Building, New York City, makes available this month 16mm sound prints of the fifth subject in the RKO series, *This Is America*, which they are distributing. Title of the April issue is:

**Air Crew**—the story, step-by-step,

of the transformation of a raw recruit into a flyer who proudly receives his wings on graduation day. The film presents a behind-the-scenes picture of the stiff training and studying program at the U. S. Naval Air Training Station in Jacksonville, Florida, where our pilots and crews receive the best training in the world.

■ **POST PICTURES CORPORATION**, 723 Seventh Ave., New York City, announces the availability of another Hal Roach feature picture on 16mm sound, namely:

**Topper Returns**, which follows the further adventures of Topper, the amateur detective who turns strange happenings into outbursts of gaiety. Featured are Roland Young, Joan Blondell, Carole Landis, Dennis O'Keefe, Billie Burke, and Eddie (Rochester) Anderson.

The sixth edition of the Post Pictures catalogue is available on request by writing to that company.

■ **BRITISH INFORMATION SERVICES**, 30 Rockefeller Plaza, New York, report many new 16mm sound subjects on Britain at War, including:

**Letter from Ireland** (22 min.)—a film letter describing the training, living conditions and recreations of American soldiers in Northern Ireland.

**Cameramen at War** (15 min.)—showing them in action and some of the famous scenes they have shot right in the forefront of the battle, armed only with cameras.

**Up Periscope** (21 min.)—a tense story of a British submarine on patrol in the North Sea. After successfully attacking an enemy ship, it dives and awaits the counter-attack.

**Tank Patrol** (37 min.)—dramatized incident in the desert concerning a stranded tank crew. How they elude the enemy and rejoin the British.

**Come Again** (16mm.)—changes the

war has wrought in British ways of living, as seen by three returning emigrants.

**Nations Within a Nation** (16 min.)—how the exiles of nine European nations, which now have recognized Governments in London, carry on their own national life and institutions.

■ **WALTER O. GUTLOHN, INC.**, 25 West 45th St., New York City, announce the release in 16mm sound of a feature production exposing Japanese treachery and contempt for western civilization. The film, acclaimed by many critics as "one of the ten best," is titled:

**Hara Kiri**—starring Charles Boyer, Merle Oberon and John Loder. The plot concerns a ruthless, inhuman Japanese war-lord and his downfall, and portrays the fanatical devotion of the Japanese for the ancient traditions of Nippon, no matter how barbaric. Pictured are some of the most spectacular naval battles ever filmed. The picture is available for rental and long term lease.

Two new one-reel films added to the Gutlohn educational library of 16mm sound short subjects are:

**Fundamentals of Boxing**—a detailed demonstration of every move, offensive and defensive, by Carl Siebert, veteran boxing instructor, and his students.

**The Eight Parts of a Business Letter**—showing how mail is handled, why letters are standardized as to form in business, the difference between social and business forms, the various parts of a letter from heading to signature, basic displays and arrangements of the parts. Every essential element of form is visualized.

■ **FATHER HUBBARD EDUCATIONAL FILMS**, 188 W. Randolph St., Chicago, has just released in 16mm. sound, the feature film:

**Mush You Malemites**—based on Father Hubbard's book of the same title. Filled with adventure, humor and human interest, the subject covers the dramatic trek through the Alaskan wilderness enroute to Aniakhak, described as the greatest active volcanic crater in the world. The crater is filmed in its breathtaking destruction immediately after its earth-shaking explosion. Alaskan life and scenery in the depth of frozen arctic nights and blooming summer beauty is vividly depicted.

■ **THE PRINCETON FILM CENTER**, Princeton, New Jersey, is booking 16mm, sound prints in full natural color of one of its latest releases titled:

**Empire on Parade**—a forty-minute film document of the immense resources of the Northwestern area of this country served by the Great Northern Railway—a vast section of the nation which is now supplying many of the essentials of war.

■ **WESTINGHOUSE ELECTRIC & MANUFACTURING Co.**, 306 Fourth Ave., Pittsburgh, Pennsylvania, traces the 23-year history of broadcasting in its new film:

**On the Air—The Story of Radio Broadcasting** (28 min.)—16mm and 35mm sound. Scenes in the swift rise of the radio industry are re-enacted. Depicting the detailed operations of a typical broadcasting day, the film covers writing, scripting, rehearsal, timing, production and presentation of a broadcast. Next the technical side of broadcasting is shown. The picture predicts a rapid growth in the process of radio-photo transmission, and in the use of television and shortwave broadcasting.

The film is distributed free to schools, churches and associations by the Westinghouse School Service department.

■ **OFFICIAL FILMS**, 625 Madison Ave., New York, have issued their latest "Sportbeam," covering

**Big League Baseball**—in which the big league players, and the specialized plays that have made them famous, pass in review in an entertaining and instructive manner. Batting, pitching, running, bunting, sliding, home-run and all the tricks of the diamond are demonstrated. The film is available in 8mm silent, and in 16mm silent and sound.

■ **GENERAL ELECTRIC COMPANY**, through its Photolamp Division at Nela Park, Cleveland, Ohio, has produced an educational movie featuring the technical aspects of flash photography. The 3-reel film—available in 16mm and 35mm—is intended for immediate use by photographic schools of all branches of the military services. It is also designed to educate professional and amateur photographers on how better flash pictures may be taken.

Slow motion sequences permit the human eye to follow the swift action of various camera shutters, of the performance of popular flash bulbs, and of high-precision timings. This has been achieved through adroit use of extremely high speed motion picture photography. The film features the operations and characteristics of between-the-lens and focal plane shutters, various midget flash bulbs, and the relative merits of sundry reflectors—all with relation to one another. Detail action is shown through animation.

Prints of the film are handled by G.E. Lamp Department's district offices where arrangements may be made for showing the picture locally.

## Among the Producers

### Paul Thornton Named Director of RCA Educational Department

Appointment of Paul Thornton as director of the Educational Department of the RCA Victor Division has been announced by Robert Shannon, general manager of the Division. At the same time, Mr. Shannon announced that the Educational Department activities are now a part of the company's Advertising Service Department, under the supervision of the Advertising Director, Charles B. Brown.

The department which Mr. Thornton directs, with headquarters in Camden, N. J., was established in 1911 as a service for schools. It now assists teachers and school administrators in the selection and utilization of records, phonographs, radios, sound systems, movie projectors and other equipment which RCA makes available for schools. An important wartime service is that of providing radio and other technical information for pre-induction training programs.

Mr. Thornton joined RCA's Educational Department in 1940, and has served as assistant director for two years. Prior to 1940 he taught for 12 years in elementary schools, high schools and colleges in the Midwest and South. He also served for some time in a supervisory post with the State Department of Education in Louisiana. He received his B.S. degree from Kansas State Teachers College, Emporia, Kans., in 1928, and his master's degree from Northwestern University in 1936.

### S.V.E. Slidefilm on Slide Binding

A new 33-frame slidefilm on the proper techniques for using the S. V. E. Slide Binder has been announced by the Society for Visual Education, Inc., 100 East Ohio Street, Chicago

11, Illinois. It will be furnished free to those in charge of the visual instruction departments or courses, and to others who are using the binders regularly.

The slidefilm presents the few common tools required for using this simple and safe binder—scissors, brushes, water container, blotter and soft cloth. Next is shown the proper steps in removing Kodachromes from their mounts for binding, followed by instructions for the proper cutting apart of double-frame prints for binding. The next sequence follows each step of the process of binding, to achieve the desired protection of the film from dust and moisture. The same procedure is followed for either double or single-frame slide mounting in the regular binder, except for the addition of the single-frame mask. This is also the procedure used to bind films of bantam size in the special bantam binders.

Further information concerning the new slidefilm and the S. V. E. binders will be furnished upon request.

### C. C. Cooley Becomes Da-Lite Screen Vice-President

Mr. J. C. Heck, President of Da-Lite Screen Company, Inc., Chicago, announces the election of Mr. Chester C. Cooley as Vice President in charge of sales and advertising.

Mr. Cooley has been with the Da-Lite Screen Company for 18 years. He has had broad experience in both the production and sales departments and is thoroughly familiar not only with his company's products, but also with the needs of Da-Lite customers. Mr. Cooley is also Vice President of The Photographic Manufacturers and Distributors Association.

### Recruiting Films "Get Their Man" in Canadian Wilds

News of what's happening in the War and Canada's share in the fighting is being brought to isolated sections of the North Woods and the Arctic regions by a traveling Victor

16mm sound motion picture unit of the Canadian National Film Board. Operated and transported by three members of the Canadian Armed Forces, this mobile unit is effectively aiding the recruiting efforts in regions which could not otherwise be reached with visual propaganda. The recruiting films use French or English sound tracks, depending on the language of their audience.

The run consists of a Victor 16mm Animatophone and Speaker, its own 100 watt generator power unit and a library of films.

Mobile Victor Sound Motion Picture Unit.

### Wartime Uses of Filmosounds

Thirty-two Royal Canadian Air Force stations in Canada each have a band—without the benefit of bandsmen and instruments! Soon, by means of motion picture film, all air force stations across Canada will have this same type of mechanized band music, played by the outstanding band of the RCAF for as long as forty-five continuous minutes. This is a further illustration of another wartime use of motion picture film—the broadcast of martial music on a Bell & Howell Filmosound for the entire regiment.

The Filmosound unit is demountable, and can be used to project motion pictures with sound accompaniment in barracks, doubles as a public address system, and is an over-all unit with entertainment

Broadcasting with B & H 16mm sound equipment.

and educational utilization. The current news is broadcast to the entire forces; the officer in charge can deliver his orders by means of the Filmosound public address systems; and route marches, ceremonial parades, drill ground training, and lectures now reach the boys in the RCAF via motion picture equipment.

### Filmosound V Available for Essential Purposes

The Filmosound V, 16mm sound-on-film motion picture projector, is available at this time on priority for essential purposes according to prevailing government directives. This compact, sturdy, precision-built, easy-to-operate product of Bell & Howell engineering achievement is being used to project the sound movies that entertain and instruct our soldiers of today and educate our citizens of tomorrow. Until priority regulations are lifted, the limited supply of those Filmosounds must be restricted to sale to the armed forces, hospitals, and schools.

The latest edition of the Filmosound sales folder is available upon request from Bell & Howell Company, 1801 Larchmont Avenue, Chicago 13, and describes the features of the new B&H Filmosound V.

### New Keystone Physics Units

A completely revised and enlarged Physics manual has been prepared by Harry N. Wheaton for the Keystone View Company, Meadville, Pennsylvania, to accompany their new series of physics slides. This manual emphasizes two fundamental courses urged by the War Department for particular attention in high schools—"The Fundamentals of Machines" and "The Fundamentals of Electricity." Both of these courses were worked out by the author in accordance with the outline proposed by the War Department. The manual also covers two other subjects, "The Fundamentals of Sound," and "The Fundamentals of Light."

The manual and series of slides have been carefully prepared and will be of permanent usefulness to schools, regardless of war needs. The manual alone sells for \$1.00. It is furnished without charge when five or more units from the slide series are purchased.

### Radiant Screen Plan for Post-War Placement of Service Men

Unusual enthusiasm from both service men and industry has greeted the inauguration of a soundly conceived post-war plan for assuring proper placement for men and women in the visual equipment and photographic field after they leave the U. S. armed forces. Developed by the Radiant Manufacturing Company, Chicago manufacturer of screens, this program is now in full swing and is bringing some surprising results. The specific object of the Radiant plan is to obtain the registration of all men and women who are engaged in visual training, film production and film distribution, or who had visual equipment experience before entering the armed forces so that those who wish to continue in this field after the war can be located.

Special registration cards for this purpose have been prepared by the Radiant Manufacturing Company and distributed at points where all types of training and entertainment films are stored and projected, and where equipment is serviced. These cards list the previous experience and background of each registrant, as well as the specific fields in which post-war interest is indicated.

These fields include the production and distribution of films and the sales, servicing, manufacturing, retail and wholesale distribution of projection equipment. Registration cards are beginning to pour in to Radiant headquarters. When the files are completed, the lists of these registrants will be sent to manufacturers, distributors and retailers in the visual training industry. Naturally, service men and women have indicated their sincere appreciation of this opportunity to prepare for their post-war future. Numerous expressions of approval have been received from commanding officers and executive personnel.

### DeVry Honored

DeVry Corporation, 1111 Armitage Ave., pioneer manufacturers of motion picture sound equipment, has been awarded the signal honor of receiving a second white star for its ARMY-NAVY E Flag—denoting continued production excellence for the war effort on the part of its personnel.

In the letter of notification, C. C. Bloch, Admiral USN (Retd) Chairman Navy Board for Production Awards, advised President William C. DeVry that the additional white star, which the renewal of the "E" award adds to their Army-Navy "E" flags, "is the symbol of appreciation from our Armed Forces for your continued untiring effort and support so necessary for victory."

DeVry is the only concern in the United States to be thus honored for the manufacture of motion picture sound equipment and secret electronic training devices incorporating motion picture projection principles developed by DeVry's founder, the late Dr. Herman A. DeVry.

### Bibliography Available

A Bibliography covering the subject of "The Use of Motion Pictures in Education during the Past Twenty Years" has just been completed by Charles R. Crakes, Visual Educational Consultant for the DeVry Corporation.

Titles of twenty-five books, articles, film directories, and periodicals offer a basic reference list for the study of administration and utilization practices in the field of audio-visual aids. Copies can be obtained without cost from the DeVry Corporation, 1111 Armitage Avenue, Chicago 14, Illinois.

### New Eastman Aerial Camera

An aerial camera that will photograph from a height of 40,000 feet upwards, is now being produced by Eastman Kodak Company for Army use. To test the operation of the camera at temperatures to which it will be subjected—from forty-five to seventy degrees below zero—Eastman workers had to wear Arctic clothing, such as is used by the Air Force.

### Roshon Moves Headquarters

The Russell C. Roshon Organization, 16mm sound motion picture distributors, has moved its headquarters office from Pittsburgh, Pa., to Suite 2200, RKO Bldg., New York City (20).

In line with its policy of expansion the company has also recently opened its sixteenth branch exchange in the Liberty Life Bldg., Charlotte, N. C.

The Roshon Organization are exclusive distributors of many Walt Disney cartoons in 16mm sound and a large number of Columbia features. The library also includes Westerns and other Hollywood features, serials and short subjects in 16mm sound.

## Additional Valuable Literature —

### "1000 AND ONE"—The Blue Book of Films

"1000 and ONE" The Blue Book of Non-Theatrical Films, published annually is famous in the field of visual instruction as the standard film reference, indispensable to film users in the educational field. The **CURRENT, NINETEENTH EDITION** lists and describes over 5,000 films, classified into 176 different subject groups (including large groups of entertainment subjects). A valuable feature is a complete alphabetical list of every film title in the directory. Other information includes designation of whether a film is available in 16mm, or 35mm, silent or sound, number of reels and sources distributing the films, with range of prices charged.

136 pp. Paper. Price 75c. (25c to E. S. Subscribers)

### FILM EVALUATION SUPPLEMENTS TO "1000 and ONE" under The National Film Evaluation Project

A new and unique service to the teaching field. Film Evaluations made by nation-wide Judging Committee of over 500 teachers after actual use of the films with classes.

Each Supplement consists of 50 standard-size library cards carrying detailed evaluations of 50 films, based on combined scores of 15 or more teachers on each film. Three Supplements have appeared to date. Another appears as soon as 50 more films attain their quota of 15 or more scores.

Price per Supplement—50 cards in carton, serially numbered 1 to 50, 51 to 100, 101 to 150, etc., with full explanations accompanying, 50 cents (postpaid if cash with order.)

### THE AUDIO-VISUAL HANDBOOK (4th Edition) By Ellsworth C. Dent

Presents in convenient form, practical information for those interested in applying visual and audio-visual aids to instruction. The six chapters include discussions on "The Status of Visual Instruction," "Types of Visual Aids and Their Use," "Types of Audio-Visual Aids to Instruction," "Types of Sound Aids for Schools," "Organizing the Audio-Visual Service," "Source List of Materials and Equipment."

212 pp. Illus. Cloth. Price \$1.75

### AUDIO-VISUAL AIDS TO INSTRUCTION By Harry C McKown and Alvin B. Roberts

A practical volume which shows the teacher and administrator how to select, organize, and utilize audio-visual aids of all types, in all subjects, and at all levels, from kindergarten through the twelfth grade. Primary emphasis is on actual practice and every effort has been made to include specific information and advice which will be most helpful in the classroom.

384pp. Cloth. Illus. Price \$3.00

### PICTURE VALUES IN EDUCATION By Joseph J. Weber, Ph. D.

Presents in unusually interesting form the results of the extended investigations on the teaching values of the lantern slide and stereograph.

156 pp. Cloth. Illus. Price \$1.00  
(67c to E. S. subscribers)

### AN ALTERNATIVE FOR REVOLUTION AND WAR By Albert E. Osborne.

A stimulating, wide-range view of the higher potentialities of visual instruction in promoting world harmony by a "more humanity-centered education." A pertinent reply to H. G. Wells's dictum that the "future is a race between education and catastrophe."

124 pp. Cloth. Price \$1.25.

### EVALUATION OF STILL PICTURES FOR INSTRUCTIONAL USE. By Lelia Trolinger

A full presentation of the latest piece of research on determination of teaching values of pictures. Development of the Score Card and elaborate experiment in use of same. Full documentation, tabulation of results, and appendices. The latest, most complete and scholarly investigation of a problem in the visual teaching field that has long needed such a solution.

48 pp. Paper. Illus. Price 50c.

### PRODUCING SCHOOL MOVIES By Eleanor Child and Hardy R. Finch

Based on first-hand experiences of the authors and those of many other teachers and movie enthusiasts. Chapters are "Organization (of a Club); Choosing the Idea; The Scenario; Buying Equipment; Using the Equipment; Filming the Picture; Advanced Techniques; Final Preparation and Showing. A welcome book to those who want movie-making explained in simple terms.

151 pp. Paper. Illus. Price \$1.50.

### SELECTED FILMS FOR AMERICAN HISTORY AND PROBLEMS. By William H. Hartley

Part I gives directions for obtaining, evaluating and utilizing films. Part II comprises a fully annotated catalog of the most useful films for illustrating various aspects of American Civilization. Title of film, length, whether sound or silent, production date, producer, sale and rental price and grade level suitability, are given. Also synopsis of film content. Suggestions are offered concerning most effective application of the film to the teaching situation.

275 pp. Cloth. Price \$2.25.

### THE USE OF VISUAL AIDS IN TEACHING By Ella Callista Clark, Ph. D.

Brief, clear, concise, authoritative. An attractively printed manual of procedure for all visual aids in teaching, with stimulating suggestions for the inexperienced teachers as well as for the veteran.

24 pp. Paper. Illus. Price 25c.

### HOW TO MAKE HAND-MADE LANTERN SLIDES By G. E. Hamilton

24 pp. Paper. Price 10c.

### THE STEREOGRAPH and LANTERN SLIDE IN EDUCATION. By G. E. Hamilton.

The most comprehensive discussion yet published.

47 pp. Paper. Price 15c.

**TRAINING FILMS!**

**VISUAL AIDS FOR VICTORY!**

Here is a new and complete catalog of value to every industry... every training school in the United States! It describes every one of the films now available... both those released last year and NEW ones released this year. It gives data, prices... tells you about the new film strip and instructor's manual available with *each* film!

**WIDE RANGE OF SUBJECTS!**

**Machine Shop... Aircraft Work... Shipbuilding... Farm Work**

When you go through the new free catalog you will discover that you have available films on precision measurement, engine lathe, milling machine, vertical boring mill, radial drill, sensitive drill, vertical drill, bench work, shaper, single point cutting tools, 25 films on shipbuilding—from surfacing foundations to installing pipe; films on aircraft work that range from sawing template metal to tube bending; films on repairing farm machinery, canning, sheep shearing.

While films are arbitrarily listed under

different classifications—all industries having machine shops will find machine shop films valuable. The aircraft industry and the machine shop industries will find many of the shipbuilding films applicable to their own businesses. Shipbuilders will find that they can use many allied films. And manufacturers of farm machinery, wool buyers, and canners will find the agricultural subjects of value. All the films are part of an integrated program to help you increase efficiency and production.

**PHENOMENAL RESULTS!**

U. S. OFFICE OF EDUCATION films were used last year—are being used now—by *every key manufacturing plant... every major training school... in the United States*. Users have discovered that the films help to cut time, cut waste, and increase efficiency of production. They can help you speed victory

now... AND... build towards higher efficiencies in the postwar world!

**ACT NOW!** To appreciate fully what this program of visual education can mean to you, send for the free catalog without delay. When you receive it, study its pages carefully. See how you can use the films effectively... today, and in the future!

**Distributor for  
THE UNITED STATES  
OFFICE OF EDUCATION**

**SEND COUPON TODAY  
NOW!**

**SAVE TIME, AND INCREASE EFFICIENCY  
WITH "THE SLIDE RULE," NO. 179!**

(The "C" and "D" Scales)

Last year, "THE MICROMETER" helped to teach thousands of workers how to use this all-important precision tool. "THE SLIDE RULE" is a companion film of equal basic importance. It helps to teach through seeing... through hearing. Simply. Quickly. Clearly. Animated diagrams help to give the worker a quicker

understanding. Use this visual aid now for Victory! Price:

# ANOTHER STAR FOR OUR "E" FLAG

*Another First*  
for **DeVRY**

To the company whose founder gave the world the idea of portable motion picture projection—an idea that has contributed so much to the training and cheering of our men and women on the fighting fronts—is awarded another top honor—a *third consecutive Army-Navy "E" pennant for production excellence in the manufacture of motion picture sound equipment.* To DeVRY workers—it is reassuring that each shipment of cameras, projectors, and electronic gunnery trainers built by them helps to hasten the dawn of a NEW and SECURE Tomorrow!

DeVRY 16mm  
Sound-on-Film  
Projector

Out of the laboratory of wartime necessity and the relentless proving ground of war—is emerging a NEW, postwar DeVRY—a DeVRY worth waiting for. On V-Day, DeVRY will be ready with finer, sturdier, lighter, and reasonably priced motion picture equipment and associated electronic products—designed, engineered, and built to war-born perfection . . . "the World's Most Complete Line of Motion Picture Equipment." DeVRY CORPORATION, 1111 Armitage Avenue, Chicago 14, Ill.

## THIS TEACHING AID OF TOMORROW ... IS AVAILABLE TO SCHOOLS TODAY!

112-Page  
Teacher's Manual

### ECONOMIC AND PLACE GEOGRAPHY FOR INTERMEDIATE GRADES

FILMSETS value and utility is increased many-fold by 112-page Teachers Manual with 672 carefully selected illustrations from the films. Each 2-page spread is a lesson outline—a quick, convenient supplement to aid teacher's introduction and review of textbook or lesson subjects.

To FILMSETS purchasers is available an attractive metal self-humidifying film cabinet, each drawer built to house and preserve 12 films.

*In building FILMSETS three requirements were made of every scene accepted; (1) accuracy and authority, (2) photographic quality, (3) correlation with lesson theme.*

● FILMSETS are the only direct classroom teaching films planned, photographed and captioned to teach Geography and Social studies to a particular age group—with meticulous attention to accuracy and authenticity of subject matter and without padded sequences for photographic effect. FILMSETS are 200-foot, 16mm silent films covering 22 subjects in Economic (food, shelter, clothing) and 26 subjects in Regional Geography. Write today for details about FILMSETS that took five years to produce—at a cost of \$100,000—and that are immediately available at the surprisingly low cost of \$12.00 per reel. Buy as many reels as you wish.

## Knowledge—up to the minute

New facts, new developments, new changes arise daily out of the swiftly moving events in a world geared to war and war production.

The Spencer Model VA Delineascope is performing an invaluable service, because, in addition to lantern slides, it can project the printed page, charts, photographs, diagrams and even opaque parts and objects. *Visually*, it keeps military, production and training groups, large and small, abreast of last-minute developments.

Write us for information about this double-duty projector.

## When World War II is HISTORY...

... it will be much more than a list of dates and unpronounceable place names for tomorrow's students. It will be *movies* . . . grim, factual, revealing motion pictures of what war really is...stripped of glamor. And it will be the most powerful argument for lasting peace that's ever entered a classroom.

And when peace comes, the Filmsound Projector, now built only for war service and for other essential purposes according to prevailing government directives, will return to the important task of helping you teach young America.

The Filmsound was chosen by the armed forces because of its simplicity of operation . . . its extreme portability . . . its ability to take rough treatment . . . AND because it provides brilliant, steady screen images and faithful sound reproduction.

\*Trade-mark registered

\*Opti-onics is OPTics . . . electrONics . . . mechanICS. It is research and engineering by Bell & Howell in these three related sciences to accomplish many things never before obtainable. Today, Opti-onics is a WEAPON. Tomorrow, it will be a SERVANT . . . to work, protect, educate, and entertain.

The Filmsound that *you* will use after Victory will embody refinements developed to enhance each of those *necessary* characteristics. All we've learned in meeting and surpassing rigid Army and Navy standards will go into designing and building *finer* motion picture equipment for you.

### We Say This Humbly

No group has contributed more to America's coming Victory . . . with less fanfare . . . than teachers. It's largely their work that built the integrity of character which makes an American soldier self-reliant, sensible, courageous and sure of his ability. Without the principle of free education . . . and the *right* people to administer it we could be less certain of the future.

Bell & Howell Company, Chicago; New York; Hollywood; Washington, D. C.; London. *Established 1907.*

### FILMING HISTORY FOR TOMORROW

In the air, with the foot-slogging soldier, behind the big guns, in tanks, on ships . . . young men like these armed with B&H Cameras are risking their lives hourly to make a complete film record of this war. Movies of each engagement, each bombing mission are studied by men still in training to perfect their effectiveness in combat.

Scene from *The American Nile* filmed by Count Byron de Prorok. It tells the story of the decadence of the ancient Mayan civilization.

### FILMSOUND LIBRARY BRINGS THE WORLD TO YOUR CLASSROOM

Among the thousands of Filmsound Library motion pictures are many authentic records of the life and customs of all parts of the world. The coupon will bring complete catalogs and your copy of *The Educational Utilization Digest* which evaluates each film for subject application and age group.

# Miscellany of the Month

## Events and Achievements

**V**ISUAL education meetings scheduled for July are:

Department of Visual Instruction at Pittsburgh, Pa., July 4, when the 1944 Representative Assembly of the NEA opens its conference.

Conference on Audio-Visual Aids, held by the Visual Aids Service, University of Illinois, Urbana, July 11-13.

Audio-Visual Institute, University of Wisconsin, Madison, July 17-22.

Sixth Midwestern Forum on Visual Teaching Aids at Bellfield Hall, University of Chicago campus, July 21-22.

Further data on these programs will be given in the June issue.

- The "first film made expressly for television presentation," says Will Bishop, MGM publicity director, is titled "Patrolling the Ether" and was shown on April 10th to a trade audience by Zenith Television Station W-9XZV.

- The Federal Communications Commission has received 109 applications, so far this year, for new broadcasting stations. Of these, 66 were for Frequency Modulation, 25 for Television, and only 18 for standard broadcasting. Many think this points the trend of the future.

- Uruguay showed the *Sonja Henic* pictures. But Uruguay has no ice. So a wave of frantic roller-skating swept Uruguay. "Trade follows the films," remarked Motion Picture Herald.

- De Mille's technicolor war saga, "The Story of Dr. Wassell," was given a brilliant preview in the nation's capital before top-ranking Army, Navy, Marine Corps Officers, Congressmen, Senators, Supreme Court Justices, and social leaders of the District of Columbia. Receipts of \$25,000.00 went to the Navy League's Red Cross Fund.

- An elaborate and unique exhibit—arranged at Dartmouth College for Navy trainees and other students—presents the complete history of the three-dimension picture: From the invention of the stereoscope by Oliver Wendell Holmes and rare stereoscopic photos taken before the Civil War—through the hey-day of its social success when the stereoscope replaced the family album for home entertainment, showing a completely furnished model of a Victorian parlor—and down to the present-day Vectograph which, through polarized spectacles, is teaching the Armed Forces air photography, geometry, map-making and other wartime subjects.

- An Army film—"The Negro Soldier" (4 reels), a Frank Capra production, written and supervised by a negro, Carlton Moss, who also plays a leading role—is a social documentary of high interest and of more than wartime potentiality. It pleases the negroes. It can make white people think, even change their attitudes. It is now being released to theatres through the War Activities Committee, and a 16mm version will be available June 15th through the OWI.

## Surveys and Statistics

**A**CCORDING to the Wendt Report:

The Army has 50 to 75 Directors of Visual Aids; 250 Libraries of audio-visual materials; and 250 copies of each film produced. The Signal Corps produced 270 films in 1943 alone—its total production for the war being nearly 1000 films, which is five times the films made by Erpi in a decade and over. But cost-per-film is higher than Erpi's.

- The Will Hays Report says:

In 1943 theatres sold over \$770,000,000, in War Bonds, and personal appearances by stars another \$1,337,000,000—total over \$2,000,000,000. Theatres collected \$3,000,000 for the Red Cross, \$1,600,000 for the United Nations Relief, and \$2,000,000 for the March of Dimes.

Further data are that 417 features and 449 short subjects were released in 1943 . . . that Teaching Films Custodians Inc., a branch of the Motion Picture Producers and Distributors of America, now has a library of 6000 16mm short subjects for the use of schools (!) . . . and that 1307 new reels were added in 1943 (!) . . . that the Industry's main functions are "entertainment, information, inspiration," education not mentioned.

- The Commission on Motion Pictures in Education has started spending the \$100,000.00 given it by the Motion Picture Industry. It will first "survey the post-war application of films to the school-room," then recommend a "program of specialized teaching film production," then tell how to "integrate visual education with school curricula," and then will consider the sources of teaching film production—(1) the organized entertainment film industry, (2) commercial producers, (3) specialized educational producers. As to which will emerge as the major source of teaching films, the field can only await the Commission's conclusions. At present it appears that, after analysis of the Teaching Films Custodians achievements so far, "several of the Commission members believe that this record points the way toward even greater use of Hollywood product." The ultimate findings of the Commission should be of extraordinary interest to the educational field!

- The over-all record total attendance on a single picture is announced as 51,000,000 for "Gone with the Wind." Some five million saw it twice, a half million three times.

- Comparative motion-picture theatre figures for two years are interesting:

Gross admissions (without tax) for	
1942.....	\$1,193,400,000
1943.....	\$1,363,250,000
Average ticket price for	
1942.....	25.5 cents
1943.....	27.5 cents

Weekly ticket-buyers for	
1942.....	90,000,000
1943.....	95,000,000

(But Gallup poll says about 65,000,000)

## Plans and Predictions

**F**OUR of the many questions facing the television-planners are these: (1) Will the coaxial-cable method or the relay-station method prove better for nation-wide television broadcast? (2) Will television broadcasts be more economical and effective from film or from "live pickup"? (3) Will television news replace newsreels—or will newsreels be made as always and televised to reach the national audience more quickly than by distribution of prints to theatres? (4) William Fox poses another question—as to whether theatres will be turned into garages when real television comes.

- Televised News Programs from Press Association, Inc., radio affiliate of the AP, may be inaugurated this month through Filmidea, Inc. They will be summaries from news camera films.

- Bell Telephone plans post-war television development with 7000 miles of co-axial cable linking important cities, coast to coast, north to south, complete by 1950. First circuit, New York to Washington, ready in 1945. Another plan, by American Telephone and Telegraph Co., will construct micro-wave-length relay stations 30 miles apart between New York and Boston for regular television broadcast.

- One "expert" got into print (we mercifully withhold his name) with the wishful thought, emitted as prediction, that the post-war period will see "a good 16mm sound projector" available to schools at \$25.00. (sic!). Such absurdity in print is a high disservice to the field. Maybe it was a misprint, we hope.

- There is much agitation in England toward the idea of having war projectors "given to schools after the war." Head of the Boys and Girls Cinema Clubs, J. Arthur Rank, and the director of Gaumont-British Instructional Ltd., Javal, are staunch promoters of the plan. A group of civic-minded Members of Parliament, headed by the educational expert, Kenneth Lindsay, are trying to amend the Government's Education Bill to require every school to install a projector. Javal's five-year plan, ending as the war began, aimed at a projector each in 21,000 English and Welsh schools. Final achievement, 500 projectors installed in the five years! Obviously the sales effort needs help. The proposed free disposal of war projectors will speed up results considerably.

- Wendell Willkie's "One World" will be produced by Darryl Zanuck for 20th Century Fox, of which Mr. Willkie is Chairman of the Board. Expected to cost about \$3,000,000. Profits to be divided between the Wendell L. Willkie Fund, a charitable foundation, and Simon and Shuster, publishers of the book. At Mr. Willkie's request, the picture will not be shown until after the November elections.

# RADIANT Screen Finder

one of the most helpful devices ever made available to users of visual aids!

Thousands of users of motion pictures, slide films, slides or opaque projectors have ordered this practical device. The unanimous verdict is: "It's splendid! Why didn't someone think of it sooner?" Enables user to combine proper equipment and obtain maximum effectiveness from all types of projected visual aids. Shows at a glance:

1. The proper screen size for each distance between screen and projector with a given lens.
2. The proper screen model to select.
3. The proper distance between screen and projector to obtain any desired size of picture.
4. The proper lens to use to obtain perfect results for each distance.

Easy to read—simple to operate. Answers all "movie" questions on one side—all "still" questions on the other side. Durable and compact—fits into the vest pocket. Available from your visual equipment supplier. If he cannot supply you—send us his name and only 50c to cover actual cost, including handling and mailing—and a Screen Finder will be mailed to you direct.

**IMMEDIATE DELIVERY**  
on Radiant Metal Screens

Here's good news! Schools may now again obtain RADIANT Metal Screens—without red tape. You can get immediate delivery under your M.R.O. rating.

Forms No. 1319 are no longer necessary. Order today!

## "Schubert The Melody-Maker"

inspired by the life and music of  
The Great Composer

**W**OVEN into this delightfully entertaining Photoplay are the immortal melodies of this great Austrian composer. Although not strictly biographical, the story reflects the true spirit of Schubert, his simplicity, his struggles and his glorious musical achievements. There is much laughter, too, in the film, and the old-world settings are picturesque and beautiful.

A United Artists release, the picture co-stars Alan Curtis as Schubert, and Ilona Massey, the Hungarian singing actress, who is gay and charming as the girl with whom Schubert falls in love.

Recommended by the Motion Picture Committee of the Department of Secondary Teachers of the National Education Association, here is a MUST picture for every school.

# The Coolidge Visual Aid Squad Functions

Full details on a highly efficient organization of student-operators for school projection.

**DAVID F. CHASSY**  
Calvin Coolidge High School  
Washington, D. C.

Above: Some members of the Coolidge Visual Aid Squad.  
Left: Trainee taking projector examination under pressure.

**A**T Calvin Coolidge High School, Washington, D. C., we have a student organization which has done much to encourage the use of visual aids in the classroom. Our Visual Aids Squad, organized soon after the opening of the school in 1940, has won over many a faculty convert to the cause of visual education by the simple expedient of very definitely relieving the teacher of all responsibility for procuring and operating the necessary projection equipment.

For carrying on the program, we have portable projection equipment as follows: two 16mm. silent movie, one 16 mm. sound movie, two slide projectors, one opaque projector, besides 16 mm. stationary movie equipment in the auditorium booth. The portable equipment is used in any classroom where proper lighting conditions prevail. There is one room set aside for projection use exclusively.

The bulk of the visual instruction material comes from the centrally located Visual Instruction Library which serves the entire D. C. school system, on the primary, secondary, and collegiate levels. The material is sent by special messengers to each of the schools on a regular weekly schedule. Even during these trying times, the service is uninterrupted and very dependable. The task of the Visual Aid Squad is to integrate the above service with the visual instruction program at Coolidge.

**Step 1.** At the beginning of the school year, the Coolidge Visual Aids Office receives a catalogue from the D. C. Visual Instruction Library listing all materials available for the current year. This listing is periodically revised or supplemented. The Coolidge Visual Aids Office then prepares duplicate lists, classified by subject matter, and distributes these lists to the various departments throughout school, for permanent reference by every teacher in his own subject.

**Step 2.** The teacher consults this list periodically, selects items, prepares Form No. 1 and forwards to the Coolidge Visual Aids Office. (For example, see Form No. 1 as filled out by Mrs. Anderson on Monday, Dec. 6.) (Forms 1, 3, 5, 6, 7, are slips of standard 3x5 card size. Only Form 1 is shown here.)

**Step 3.** On Tuesday, Dec. 7, the Coolidge Visual Aids Office consolidates similar orders from other teachers throughout the school, and prepares Form No. 2 in duplicate. Both of these copies are mailed the same day to the D. C. Visual Aids Library, where they are "processed". The Visual Aids Library confirms the dates requested, or names substitute dates, and returns one copy thus processed to the Coolidge Visual Aids Office.

**Step 4.** By Friday, Dec. 10, the Coolidge Visual Aids Office is able to relay confirmations and substitutions from Form No. 2 to the teachers concerned. (On Form No. 3). When agreement is reached with teachers regarding substitution dates, the Visual Aids Office prepares Form No. 4, the Projection Squad Assignment Chart. Forms No. 2 and No. 4 are posted side by side on the bulletin board in the Visual Aids Office, headquarters for the Visual Aids Squad.

**Step 5.** On Monday morning, Dec. 13, the Visual Aids Squad operators consult Forms 2 and 4 for the operations scheduled. For example, the first operator assigned for Monday, Jane Miller, looks for the box next to her name. She will note the Key No. 89. She realizes, by a glance at both forms, that she is to operate a 3-reel silent movie, "From Clay to Bronze," in room 316, for Miss Fontanini.

**Step 6.** Our operator proceeds to room 316, where she finds the projector assembled, threaded, and focused. All Jane has to do is to flip the start

button at a signal from the teacher. No time is wasted. How does it happen that Jane finds all in readiness upon her arrival in room 316? This is because of the squad's co-operation.

You will note on the Assignment Chart that Jim Strand and William Sealfrank are assigned to the AM preliminary period. The boys are members of my home room class. Since my room adjoins the Visual Aids Office, it is a simple matter for them to attend to both their home room duties as well as their squad assignments. Next to Jim's name on the chart are the symbols which mean that Jim is responsible for the setting up of any silent projector scheduled for the first period, with

its proper film, or any opaque projector. The symbols next to Bill's name similarly instruct Bill to set up a sound machine for the first period, whenever scheduled, or a stereopticon. This explains why everything was in readiness for Jane when she appeared in Room 316 the first period.

Step 7. As soon as Jane has completed showing reel 1 of Film No. 89 on the machine A, she will immediately start reel 2 on machine B, which has already been threaded and focused along with machine A. While reel 2 is running on machine B, Jane will rewind reel 1 from machine A, and thread that same machine with reel 3, which will be all set to go when reel 2 on machine 8 is completed. Likewise, while reel 3 is running on machine A, Jane will rewind reel 2 from machine B. Then she will thread machine B with reel 1, which you note was rewound a little while ago. When reel 3 is completed on machine A, the teacher takes over. Jane then carries on by rewinding reel 3 and threading machine A with reel 2. Thus both A and B machines are again in readiness for the second period under another operator, Don Witters. Of course, we assume that two silent machines were available for this period. When we use our single sound machine, we just don't synchronize. We have hopes. Incidentally, it is rare that Jane is required to project more than three reels dur-

ing any one period, generally less. Our teachers usually plan for a twenty to twenty-five minute program, which leaves the operator sufficient time to prepare for the next period. When Jane has completed preparations for the second period she will return to the V. A. Office, if there is still time; otherwise, she will proceed to her next class. If any emergency arises requiring my immediate attention Jane will report directly to me in my classroom.

**Step 8.** At the beginning of the second period, Don Witters reports to the V. A. Office, checks in, and proceeds to his assignment. Upon arrival in 316 Don will double check on his associate's preparations, and await the "go" signal from the teacher. At the end of the period all is in readiness for Howard Brooks to take over for the third period. And so it goes until the fifth period when Westerfield takes over. Westerfield notes on the Assignment Chart that although he is to project No. 89 during the fifth period, he must prepare No. 88 for his sixth period successor, Henry Porten. Therefore, before proceeding to room 316, he picks up film No. 88—"The Silversmith," scheduled for Mr. Jacoby's class. At the close of the 7th period showing of film No. 88, Norton Marshall will cart all the equipment back to room 115. Marion Boat, Inventory Clerk, will make his daily check (on form No. 5).

The Training of the Operators

Obviously, the synchronization of this student activity requires adequate training. Since I, myself, carry a full teaching program together with other miscellaneous extra-teaching responsibilities, I am in no position to take any active part in the training program. Therefore, we have developed a system whereby the more experienced squad members instruct the younger members in the "know how" of projection duties. The squad members are of three ranks—the senior members, the junior members, and the trainees. The senior members must have served effectively for at least two semesters, the junior members for one semester, before acquiring rank and title. Within each assigned period we try to have on duty one senior member, one junior member, and an occasional trainee. The senior member is responsible for the education of the trainee co-assigned with him for that period. For example, Don Witters is responsible for the training of Joe Neophyte, No. 2. Whenever Don and Joe are able to get together for a training session they take out the equipment and go over the details of good projection technique. The training is leisurely, but thorough. There is no urgent need of Joe's immediate service. Within a few weeks Joe is ready to operate the slide machine and the opaque machine. However, the training for the movie projectors is prolonged. Wit-

# Teacher Education: When Do We Start? \*

Presenting some shortcomings of teacher training in the audio-visual field, with suggested remedies.

EDGAR DALE

Bureau of Educational Research  
The Ohio State University, Columbus, Ohio

YES, when do we start? My title is provocative rather than accurately descriptive. But are we yet past first base as far as teacher education is concerned? Since this is a matter of judgment and opinion let's set up some of the standards which describe an effective teacher education program.

1. *In an adequate teacher education program in the audio-visual field there will be a statement of necessary competencies and of the experiences necessary to achieve these competencies.*

I don't believe this standard is reached anywhere. You will find scattered literature on what constitutes competency in this field. A few have attempted to put these things down on paper. But I do not know of a college of education or teachers' college which insists upon a mastery of competencies in this field.

Yes, I know that we offer courses. And some of them are compulsory. But would anyone defend them on any ground other than that they make a good start? Are any of us telling prospective teachers that they aren't ready to teach yet because they haven't mastered some simple skills in using the blackboard? Must one have stated, definite competencies in the handling of excursions in order to get a teacher's certificate? Or be a skillful demonstrator of the meaning of fractions, of how to read a map, or how to use a rotary saw safely?

I'm not now saying that, once agreed upon these competencies, we should then teach them one by one out of the context of real, live teaching situations. Indeed it is only in rich, vital teaching situations that we can develop these competencies. Better teacher education in the audio-visual field means that we must improve the general quality of teacher education. More careful attention to the general problem of what constitutes the competencies of the effective teacher will help to such improvement.

2. *A good teacher education program in the audio-visual field will require that the entire college use audio-visual materials as a regular part of its teaching procedure.*

One of the common problems faced by teachers in schools is the previewing the recordings, films, film strips, or slides that they plan to use. Failure to preview is a common weakness. But if we had effective use of these materials on the college level, many of them would not only have been seen by the teacher but also used by her in practice teaching. Hasn't the time come when we should expect every teacher to have heard the best recordings in her field, seen the

finest films, and used the best pictures before she has received a teacher's certificate?

How many colleges are making instructional use of Hollywood films—both features and shorts? Do many college students see films like "New Prisons—New Men," a *This Is America* release? Do they see "The World at War" which many of you own in the 16mm. version? Do students view the short version of "Magie Bullet?"

Are most college instructors skillful in the uses of the blackboard? Can they do simple drawing well? Do they turn readily to the blackboard to write down a technical term or to note the five or six points that they are making in their lecture. Some do. Many do not. Do most colleges use their bulletin boards effectively? Is the bulletin board in the library changed regularly? Is it attractive and inviting? If it is, students will imitate it when they develop their own bulletin boards.

Remember—we teach as we were taught, not as we were taught to teach. That's why progress is so slow. But to have an effective teacher education program in audio-visual materials, we must have an educational program that is audio-visually effective.

3. *An effective teacher education program requires a rich supply of teaching materials in the schools.*

Let's explore this a bit. A common unit in elementary geography is one dealing with China. Now, can I go into your school tomorrow and find there a file of excellent photographs on China itself, e.g., rice fields, temples, emphasis on manual labor, crops of various kinds? Or better still, would there be a file carefully classified under Industry, Transportation, Agriculture, Religion, and the like?

Will you also have easily available a large map or maps of China, by means of which these ideas just presented are clearly shown in their geographical context? Do you have large maps by means of which pupils can follow the Chinese war front? Would the map, for example, show the difficulty of access to China by land from Burma? Would it show the river valleys? The appropriate elevations and the like?

Would you have some recordings on China, perhaps Madame Chiang-Kai-Shek's speeches? Could you put your hands quickly on Pearl Buck's tribute to Sun Yat Sen in a recent *New York Times* magazine section? In other words, do you have at your finger tips a rich supply of teaching tools on this commonly taught unit or subject? Do you have a feast or a famine?

4. *Teachers in service must be regularly informed about new materials of instruction, given an opportunity to preview them and discuss problems of use with other teachers.*

If this situation does not obtain, we do not have an adequate system of teacher education. For, under no circumstances, can we assume that a four-year program of teacher-education, involving as it does far more study of subject matter than actual preparation for teaching, can give enough skills, enough information, enough attitude development to carry the student

\*Address given at The Northern Ohio Visual Aids Conference in Cleveland, April 3, 1944.

through the rest of her teaching career. You simply can't have an effective teacher-education program in the audio-visual field unless you have a careful, consistent, in-service training program also.

#### One Approach to the Problem

We are developing a teaching aids laboratory at the Ohio State University. It isn't unique. Other schools have done a notable piece of work in this field. It is only through some such plan as this that we are ever going to make any progress in this field. Compulsory courses in audio-visual education won't do it. Exhortation won't do it. Even rich supplies and materials alone won't do it. There must be intelligent practice, too, supervised skillfully.

What should be the goals of a teaching aids laboratory? First, we must be a service agency for the college. We must understand that the failure to use audio-visual aids in college teaching has usually not been a lack of interest or any unfavorable attitude. Most instructors say that it is a good thing to use audio-visual materials. There is no active opposition. But each individual instructor cannot carry forward the practice and investigation and study necessary to determine the available aids. He needs help. We have noted again and again that the average instructor who tries to use a film or recording catalog is baffled by the complexity of the offerings. Then he orders some of these materials and is often disappointed. He goes back to textbook teaching with certain misgivings.

That isn't all. Suppose he wants a certain film. He then has the laborious problem, not so complicated but very annoying, of arranging for his department to pay the dollar or two necessary for the film rental. He, or some one else, must write a letter. He must see that there is a projector available, check the film when it comes in, and the like. This is an impossible situation. Even when he has the projector and the film or whatever it is that has been ordered, he must arrange the projection and see that the room is properly darkened. This again is another chore, especially in many of our old college buildings. The result is that a series of tiny annoyances, and some not so tiny, have built up in the mind of the instructor a barrier against the use of this material.

The solution is simple. Instead of having *every* person do all this work, have *one* person do it. I know that you are saying, "Well, after all, that is what an audio-visual director does in a city school system." Yes, that is true, but we don't have many such persons in public school systems and we have still fewer of them in colleges and universities.

What I want to see, then, and we won't be successful in teacher-education until we have it, is a rich laboratory of teaching materials and teaching suggestions available to every member of a college faculty, and similar opportunities for every teacher in a school system. The war is going to hasten this. We have learned that if you are going to wage war, you have to have soldiers who are well taught and if you teach aerial gunnery or first aid or "Why we are in the war," you can turn very quickly, simply, to a film such as "Battle of Russia," to a chart dealing with a calibre-50 machine gun, to a map put out by the Morale Services Division of the War Department.

Teaching tools and teaching materials are at your fingertips. We must duplicate that in the college and university.

We must go still further. We must equip certain classrooms as teaching aids rooms. This is just a preliminary step, but a necessary one. These rooms which might well be double classroom size, should have equipment of all sorts available in them, playback equipment, filmstrip projectors, motion picture projectors, and the like. Many classes should be routed to this room and this space can be used economically.

We will not have a satisfactory teacher-education program until we have produced materials specifically for teacher-education. We shall have to show how to use audio-visual materials by using specially prepared audio-visual material. To illustrate a demonstration we need a motion picture of that demonstration. To illustrate oral reading levels, we should have a series of recordings of such oral reading. We ought to have films which show how an alert teacher uses a multiplicity of teaching material on fractions, decimals, etc. We must, of course, take our prospective teachers on excursions, but these excursions are time-consuming. We must also photograph typical excursions, how they are prepared for and followed up.

The above type materials might be described as the "how to do it." They have the advantage of specificity and the disadvantage of the fact that there are many ways of teaching. A further need in teacher education is the production of a number of teaching situations or problems. Through a film or recording, we can sharply etch a particular problem in the teaching of reading, in guiding a high school student toward a vocational career, in meeting a special type of disciplinary problem, and the like. But the films or recording or film strip does not give the answer. It merely poses the problem. It poses the problem with the sharpness, concreteness, and dramatic quality of audio-visual materials. Discussion, reading, lecturing, demonstrations will follow as possible solutions for the problem are sought.

Is this new approach in teacher-education likely to come as a wave of the future? Don't depend upon it. If you are a superintendent of schools or a principal charged with the hiring of teachers, make certain that they know their teaching materials. If that means putting pressure on us in the teachers' colleges, please do that. Teachers, in turn, who are in school systems, need to put on pressure to see that they get adequate materials with which to work. No workman likes to work with dull or inadequate tools. To the reply that we cannot afford these materials, let us answer that we cannot afford ignorance either.

The past twenty-five years has been a period characterized by attempts to get adequate materials made and to try to purchase them. We haven't licked this problem yet, but we are on the road to doing it. The other problem, that of effective use of these materials, is still in its infancy. One of the most effective ways of assuring this improved use is through a revolutionary change in methods of teacher-education. Part of that revolution must come through increased use of these new-type teaching materials in the teachers' college itself.

Two pictures from a slidefilm series on Machine Shop Mechanics made by the Society for Visual Education for vocational training in industry, showing the use of micrometer (left) and caliper (right).

## Filmstrips for War Training Classes\*

**Visual education, even under the extraordinary handicaps of the war emergency, still works.**

**JOSEPH A. ROENIGK,**  
Cleveland Trade School, Cleveland, Ohio

**W**OULD you like to "sit in" on a group of trainees for war production and see how visual aids function in the rapid training of skilled and semi-skilled workers? Here of course, we have to set up a simulated situation to show what teachers in this work have to cope with. It is very different from "orthodox" classroom procedure and at times is exasperating.

Last summer, I was doing what is called "on the line" training in a Cleveland factory where the new employees were largely "ini-grants" from the South. There were no facilities which could be called a classroom. I picked out a spot in the stockroom between rows of bins and shelves for storing parts, because it was naturally dark there when the lights were turned out. We used empty nail kegs and packing boxes for seats. I hauled in my car a portable screen, projectors and a blackboard (3 ft. by 4 ft.) which could be set up when needed.

The class was made up of production operators who were relieved from their work stations for the brief period to attend class. I recall teaching a class in a plant where it was desirable (not to upset production schedules) to have the class meet at shift time, 3:00 to 3:30 P. M. The only available place to meet was in a corner of the cafeteria. Here the workers gathered for a snack or a pack of cigarettes and the customary greetings at the "change of shift." In a din of conversation and the rattle of dishes, my class would gather and they were usually supplied with pop and sandwiches. The class was always augmented by a number of curious listeners who were not

always considerate of the teacher. You just can't be disturbed by such distractions although it is disconcerting—besides, sometimes a kind soul would buy the teacher a bottle of pop.

The experience of a co-worker doing this same kind of teaching illustrates the level at which some of this training must be conducted. He was to teach fractions of an inch, decimal equivalents and reading a micrometer, to a group of machine operators and line inspectors. For an average group this is not a big assignment but in this instance he just was not "putting it over." The word *equivalent* wasn't in their vocabulary and one woman said: "You can get as many quarters out of an apple as you want to." Illustrations such as four quarters in a dollar, etc., wouldn't work because to them, each 25-cent piece was a separate object—not a part of a larger unit. He used various devices and probably each contributed something in establishing the concept, but he finally succeeded by using a telephone directory. Each page represented a thousandth of an inch; altogether the pages made up the unit—one inch, a thousand pages. Half a book was 500 pages, a quarter book, 250 pages, etc. Thus were taught the decimal equivalents.

Not all war training classes are at this level nor the physical handicaps so extreme, nor are the members of any one class so unlike in backgrounds and abilities. If you like to work with a wide range of individual differences, try one of these classes. There are the foreman groups with high skills and abilities who are directing other workers. There are skilled mechanics who are being upgraded by learning other skills to broaden them. There are other groups composed of persons anxious to change from non-essential

\* Talk given at the Visual Aids Conference, Cleveland.

Right: Frames from the Jam Handy slidefilm unit on Mathematics.  
 Below: From "Using a Follower Rest," one of the USOE films on the Engine Lathe, distributed by Castle Films.

If the COMMON DENOMINATOR is higher than necessary, it will cause extra work.

$$\frac{2}{3} + \frac{3}{5} + \frac{7}{15} = ?$$

$$\frac{150}{225} + \frac{135}{225} + \frac{105}{225} = \frac{390}{225} = \frac{26}{15}$$

15 parts was high enough to express these fractions in like parts.

We learned that the quickest way to perform a series of multiplications and divisions is . . .

$$2 \div 3 \times 5 \div 8 = ?$$

1. MULTIPLY THE MULTIPLIERS. (NUMERATORS)  $(2 \times 5) = 10$
2. MULTIPLY THE DIVISORS. (DENOMINATORS)  $(3 \times 8) = 24$
3. DIVIDE THE MULTIPLIERS BY THE DIVISORS.  $10 \div 24 = \frac{10}{24}$

to war work—clerks, housewives, professionals—intelligent and schooled but to whom shop work is entirely strange. They are not only eager to learn but are quick to catch on—qualities which make teaching a pleasure.

The enormous amount of visual material now available for war production training has been a genuine help. There is also an abundance of printed material, such as diagrams, pictorial charts and instruction manuals, which is available for distribution to trainees. We look at this array of material and say "it's a god-send," but actually it has limitations. It is excellent in its utility if we know those limitations. The planning, production and use of visual aids are much like the same operations in the development of an automobile. It was carefully designed by engineers, tested in laboratories and on the proving ground, and then turned over to the public to drive. What the automobile manufacturer calls "bugs" did not show up when the car was tested by experts, but when handled by the average driver under conditions which were not simulated in the laboratory, deficiencies showed up.

With all this material, printed as well as that prepared for projection, there are two important requisites for its effective use—*timing* and *integration*. If we do not observe these guide posts, much of the efficiency and value of visual aids are lost. Timing is important in that the visual material must be used at the precise time in the learning process, when the trainee needs it. Too early, the material is "over his head;" too late is just too bad. After he has learned the manipulation of a tool or a machine or has performed an operation by whatever method was expedient, he has established habits which are difficult to change. There is little need for a visual aid after the learning process is completed and to correct an error in his technique requires other teaching methods.

Proper timing also includes the breaking down of a skill or operation into its elements and using a

visual aid for only as many elements as can be retained and applied through practice. That is why teaching films and slides should be short—many of them are too long and cover too much territory at "one sitting." Sometimes well planned visual aids are used improperly and miss their mark entirely. I have seen teachers take trainees, regardless of their individual progress or stage of training, to the projection room and show them three or four subjects of moving pictures—sort of a double feature night, but without the "free dishes."

Integration is a close ally of timing and consists of using various teaching devices in close continuity, so that the learning of one phase, process or operation is completed before engaging in another. It means that the shop work or skill practice must be carried on at the time the visual aid is used; that the supplementary reading, testing and follow-up or remedial teaching must follow in close sequence. This is not always easy to do and many difficulties arise because of new enrollees, absence, various learning rates, and range of background. One is often tempted to give up to easier ways of teaching, but it is results in a time of crisis that we are after. Educators have been accused of teaching much subject matter superficially, but here is a situation where a little subject matter is taught intensively. Briefly, integration, as here used, implies bringing together the many elements in the learning process, properly timed and executed to accomplish the doing of an operation or skill as near perfectly as possible, as quickly as possible.

The vital part that visual aids play in this process is obvious and the relative value of each kind of aid may be argued, but whatever kind is used, integration and follow-up are indispensable. I prefer to use filmstrips in presenting essential and detail instruction. However, I use all types, film strips with recordings, 16mm. sound film, charts and manuals—each has a worth in its place, if fitting and properly used. In

# Film Program of a Public Library\*

**The significant role that awaits public libraries in the field of adult and community education through visual materials.**

**R. RUSSELL MUNN.**

Director, Adult Education, Cleveland Public Library

FOR twenty years the Cleveland Public Library has cooperated with the local theatres in an arrangement wherein we publicize good entertainment films along with related reading. Ever since there have been printed catalogs, we have helped informal groups to find where they could borrow 16mm. educational films.

It was less than two years ago that we actually began to assemble a library of 16mm. films for direct lending to the public. The Board of Trustees made an appropriation of \$1000 for the purchase of films and, through the cooperation of the local OCD and the Council on Inter-American Relations, we became a depository for OWI and CIAA films. With this as a nucleus we have continued to expand, and we now handle films from the British, Canadian, French, Belgian, and many other governments, and have steadily filled in with our own purchases. Thus, in less than two years, we have built a collection of 400 documentary and other educational films, almost all 16mm. sound.

Our loans average 800 monthly. During 1943, our first full year of operation, we reported 7750 showings of our films to a total actual audience of 372,760 and a total per film attendance of 762,474. This may seem small to school people. However, when you consider that the borrowers are mostly adult groups and not formal classes, the figure does seem substantial. We lend to industrial plants, social agencies, schools and colleges, OCD groups, churches, clubs, PTAs, and recently have begun to develop quite a business with individual borrowers. We make no charge (except fines for late returns) to any borrower in the county. Except with the few films which we lend outside the county, all loans are on a 24 hour basis, and the films are picked up and returned by the borrower. We take no responsibility for projection.

A fundamental question which must occur to all educational film users is: Why should a Public Library be operating in this field? The answer, from the librarian's point of view, is simple. All progressive public libraries these days are convinced that their field of endeavor extends far beyond that of merely lending books to those with sufficient interest to come to the library to get them. A public library is an educational institution, with all that term implies, albeit the emphasis is on the dissemination and distribution of the materials of education. For years we have handled pictures, records, microfilm, and other

non-book materials. For decades we have been trying to find new and more effective means of disseminating and recording information. The 16mm. educational film is an educational medium and it belongs in the library with other printed matter. Furthermore, it fits into all the technical processes of a library. You can catalog it, give it a Dewey decimal number, you can put it on a shelf, you can lend it on a borrower's card, you can even include it in a bibliography, or you can refrain from doing any or all of these things. As far as the technical processes are concerned, about the only difference is that, when it is returned by a borrower, you inspect it by turning a crank rather than by leafing over pages. The wide-awake public library cannot neglect the 16mm. film as one of the most effective of all the various kinds of educational printed matter.

From the standpoint of the use of films in adult education, and I mean all kinds of informal adult group activities, the library is in a peculiarly advantageous position to serve. We are non-political, non-profit. We have no ax to grind, we are interested in ideas, not in fees. Our mandate is to serve education in any form in which it may appear, with whatever materials may be appropriate. We took a leading part last fall in organizing an institute on visual aids for the Cleveland Church Federation. We have frequently spoken before, and arranged screenings for, such groups as the Motion Picture Council, the PTA, the Federation of Settlement Houses, OCD, etc. Finally, we have conducted a great many film programs of our own. Every Friday noon we have public screenings of recent films in the Main Library Auditorium, and these meetings are consistently well attended, not only by individuals interested in the latest films, but by representatives of groups who come to see them with the purpose of using them later in their programs. We have conducted film forums and various kinds of film meetings at the Main Library and in many branch libraries. We are collecting films of interest to children and these are now being used as a variant for the ever popular storytelling hour by the children's librarians. In all cases where films are used in our own programs, we try to relate them to books and to the learning process, and we have frequent occasion to suggest speakers or discussion leaders to borrowers who may wish to augment the educational value of their films.

There are a few public libraries in the country which render similar service, although Cleveland is the only large city library so engaged, as far as I know. For a public library, this kind of service is "a natural." In conclusion, I hope the Department of Visual Instruction will recognize, more fully than is apparent in this program, the enormous importance of 16mm. films in adult education.

\*Address at Visual Aids Conference, Cleveland.

# The Film and International Understanding

DR. JOHN E. DUGAN, Editor  
Haddon Heights, New Jersey, Schools

## Interchange of Films Between Nations\*

THOMAS HODGE  
Film Officer  
British Information Services

Tower Bridge London, (from *Know Your Ally, Britain*)

BEFORE the war, I taught school in England, and my main subject was Geography. In fact I majored in Geography in College; and yet the things I've seen in the U. S. since I first came to this country some eighteen months ago, make me think that for a long time I must have been getting my salary under false pretenses. I have realized how little I knew of America and her people, and also how much more real my teaching would have been, if I could have used some good factual films about America.

Before the war, we in England had very few teaching films on any subject, and many of those we had were useless from a teacher's point of view, because they covered a subject right from the Junior Grades to the Junior College stage. In fairness to our own teachers and schools, I must say that our woeful ignorance of America and her people is about matched by that of the Americans about Britain and the British people.

I believe that a free exchange between the countries of all kinds of visual aids and especially of motion pictures is one of the surest ways we can learn about other people. (I am taking it that no one disputes my contention that we should know more of other peoples and lands.)

I hope that the international conference of the educational departments of the United Nations, soon to meet in London, will make real progress toward setting up simple machinery for a free exchange of educational motion pictures. I know that one of the sub-committees will deal solely with this question.

Much progress towards an exchange of knowledge through motion pictures has been made in the last two years. We, and the United States, have a motion picture and film strip service in Chungking; We—and I think the United States, though I am not sure about this—make many of our films available in Russia.

\*Talk given at the luncheon meeting of the Northern Ohio Visual Aids Conference, April 4, and broadcast over WJW, Cleveland.

In England, the British Government distributes many Russian films like *Soviet School Child* and *Salute to the Soviet*. So that our people could understand more about the European peoples who found sanctuary in England when Hitler swept across Europe, and the lands from which they came, and also about others of the United Nations, we made and distributed films like *This Is Poland*, *The White Eagle* (Poland), *Before the Raid* (Norway), *Our Fighting Allies* (Czechoslovakia) and a whole series on the British Commonwealth.

When America entered the war and began to make factual films, it was quite natural that we should want to show our people about the great war effort of the United States. So every OWI film which goes to England is shown to the British people by the British Government, either through its arrangements with the cinematograph trade (which by the way guarantees showing in every cinema in England), or by one of its 250 travelling cinemas which go to schools, factories, civil defense meetings, garden clubs, and so on. In fact they go to any organization which can raise an audience. Films like *Henry Browne-Farmer*, *Home on the Range*, *Bomber*, *Tanks*, and others, have been shown to more than 5,000 audiences in England.

We have also two films from the very excellent "Why We Fight" series. Frank Capra made these films to show the United States service men something about their allies and about the issues of the war. You will find *Battle of Britain* and *Know Your Ally Britain* two first-class films worthy of inclusion in any program.

Some of you may dub this exchange of films between the nations as propaganda. Who isn't propaganda conscious these days? If you feel uneasy about these films, all I ask you to do is to look at almost any of the films put out by Canadians, New Zealanders, Dutch, Norwegians, Poles, Czechs, Russians, and by the time you reach the end of your program you'll have learned a lot, but even in your most completely

A pottery class, with instructor, nurse and patients.  
(from *Psychiatry in Action*)

relaxed state, you'll be just as good an American as you were in the beginning.

I know, when I talk of British films, many will say, "Sure, the British films are good, but "the accent!" And you will probably say "the accent" in such a way as though you thought a British accent was some loathsome way of talking which the British had acquired after years of hard practice. My mother doesn't go to the movies very often. Probably once in five years. And when she does go, she says she "can't understand a word those Americans say." We see and hear so many American films that our ears have now become used to what once we thought of as your strange way of talking, and we understand them readily. I would like the Americans to hear so many British films that their ears too become accustomed to the "British accent," and, of course, when that happens I would imagine that there will cease to be a "British accent" so far as the Americans are concerned.

Here in America, films about Britain are shown in the motion picture theatres by arrangement with the motion picture industry. You recall famous films like *London Can Take It*, *Target For Tonight* and *Desert Victory*, which last by the way was shown in 11,000 cinemas out of a total of 16,000 cinemas in the United States. The OWI distributes others like *Message From Malta* and *Listen To Britain*. In addition to these two outlets we ourselves maintain our own distribution service of 16mm. sound films. At offices of the British Information Services and also at British Consulates we have set up film depositories where you can find films on farming and gardening, on the United Nations and on the British Commonwealth; science films for high school and junior college; films about our great industries, and films—like the now famous *Desert Victory*—on our armed services.

Probably one of the most important of our new films is *Psychiatry in Action*, which has been adopted

by the American Psychiatric Association. It shows the psychiatric treatment of neuroses in servicemen and civilians, and so is of tremendous interest not only to hospitals, doctors and nurses and psychiatric workers, but also to the many adult organizations now studying the problems of the rehabilitation of the service men or women.

A great beginning has been made during this war towards securing a greater and freer exchange of knowledge and information about our countries through the medium of motion pictures. Let us all work for some way to continue and to extend this exchange. As I see it, each country's contribution towards the building of the Peace can only be in proportion to its people's understanding of the problems and peoples involved, and I believe that motion pictures, together with all other available media, can best bring about this understanding.

### Filmstrips for War Training Classes

(Concluded from page 203)

teaching groups of wide ranges in learning ability and background (I have asked many of them which they like best), the motion picture is too fast in action. Narration is likewise too fast for some, and in both mediums, the commentary has words and terminology not always familiar to the group. When using filmstrips, the explanations can be tailored to fit the group. I prefer to use movies at the beginning of a lesson to stimulate interest or at the end to summarize.

In the selection of filmstrips for the mainstay, I like them without captions for use with such groups. Some descriptions are too advanced for these learners, and may also distract their attention from what the teacher is saying in connection with the slide. The photographs and diagrams need to be very simple, reduced to basic elements as far as possible. As a rule, visual material cannot be too simple—more often than not, it is too complicated.

When and if third-dimension views are ready for teaching purposes, they will be a big help. Two dimensional material lacks reality to many who are not versed in mechanical drawing. Cross-sections are often misleading. I had a woman trainee ask me why the pistons in the diagram were square shaped and the ones I showed her in the engine were round. With three-dimension pictures, blueprint reading and mechanical drawing will be easier to teach.

When using visual aids in any combination and singly, I have much faith in the tests or check sheets as a follow-up. The test or check sheet is not an examination—it is a teaching device. I find it particularly useful with adult groups. It is a stimulus for further investigation into the subject and usually results in heated discussions giving the teacher a splendid opening for re-teaching. Nothing is so flat as a lesson where there are no questions or discussion by the group. This device forces out questions and a high score is something to compete for. I let them grade their own papers, or exchange them with the comment: "Trade with someone you think won't cheat you." The higher the intelligence and broader the background of the class, the more effective is this device.

# MOTION PICTURES— NOT FOR THEATRES

Installment 57 continues the story of the first important educational talkie program which began under the wing of the Bell Telephone System

By ARTHUR EDWIN KROWS

## Chapter XIII—Conversation Pieces

IN THE MEANTIME plans were proceeding apace for the making of an Erpi educational series. Several outside educators remain individually and independently convinced that the intention of making a teacher-training series was their suggestion during visits of inquiry to Col. Devereux and that they have been deprived of credit for it. However, I feel that the nature of the Erpi educational committee, with its strong ties at Teachers College, Columbia University, is sufficient to explain a spontaneous origin. At all events, the first emphasis *was* on teacher-training.

### Teachers Come First

APPARENTLY it was felt that those who were trying to promote the new ideas in education would most cordially welcome this obviously useful medium of the talking picture and develop it most actively. Also, that pictures showing these educators and what they were doing would be most eagerly sought wherever teachers congregated for self-improvement and in the Parent-Teacher Association meetings. The chief succeeding objective, pictures in the classrooms, would follow naturally when the teachers had learned the effectiveness of the talking screen for themselves.

Everything was with allowance for the time factor. Erpi could afford to wait. It was an everyday saying around the place then, that, "The Bell System has been in existence for fifty years; it is building now for the next fifty." That was it. The Bell System was a tremendous organization commanding the communications industry. Talking pictures from its point of view were a mere incidental consideration. They did not constitute a drop in the bucket compared with the telephone. There was plenty of money to spend, and the officers could easily and comfortably wait to learn from possible, probable mistakes. No group like this had ever been seen before in either theatricals or non-theatricals.

Working under the probationary arrangement with Paramount had its advantages. The Paramount News Building, in West 43rd Street, over near Tenth Avenue, was more inconvenient to reach than the Fox Studio, but, once there, we were among practical motion picture men who were not too abashed by the profundities of the sound engineers. They had a processing laboratory in the premises, and their tiny stage was remarkable for its compactness. Fred Waller, manager of the industrial division and in charge of the trick photography for the organization (the same who at one time

not so long before had served in the Film Guild) was not only a tireless worker, but he was familiar with all of the short cuts, including many which he had devised himself to take advantage of the possibilities of sound. His assistant, Leslie Rousch, son of a veteran film laboratory man, had been trained along the same lines.

Waller made an excellent impression on the Erpi educational committee in the first work he did for them. Even before Stokes had returned from Europe to begin work with Erpi, they had decided that nothing could be more convincing to teachers in training than to see for themselves the actual methods used in the modern experimental schoolroom. Accordingly, when Stokes had returned from the Berlin advertising convention and

"One-way vision dome" at the Yale psycho-clinic. The wire mesh of the dome, brightly lighted within and dark outside, appears solid to the unsuspecting baby in the crib.

Arnsperger had been engaged, Waller and his camera crews had been sent to an experimental school in Bronxville to photograph actual situations without rehearsal. If the scenes were not spontaneous, the committee said, they would be valueless. Not knowing how the action might develop, all Waller could do was to light the room in its entirety, set up a number of cameras to cover every angle of visibility, and shoot. What might become usable thereafter was just a matter of luck.

Waller, who had been accustomed to the most rigid budget economies in production, stood by helplessly in this fantastic situation, while, to his everlasting disgust, the cameras ground out in one afternoon upwards of 16,000 feet. Out of this material two tentative two-reel subjects, entitled respectively "A Case of Professional Study, Grade I," and "A Case of Professional Study, Grade VI,"

were assembled but quietly shelved. More than two years afterward a rehash of the material was made for its silent values, and provided with a lecture spoken by one of the teachers at the school. The original sound was virtually unusable, as Waller very well knew it would be in such uncontrollable circumstances. With microphone suspended on high out of screen range of the cameras, hard floors, walls and ceilings to echo and reëcho the noise, many of the children seated on kindergarten chairs, low down, and the unpredictable sounds including hammering and sawing as well as differently pitched voices, nothing else could have been expected.

This footage was screened repeatedly in its unassembled form as Arnsperger and the committee considered what might be done with it. But other projects had arisen to occupy them, and putting the Bronxville reels aside for then, the committee turned to the new ones. One of these was a two-reeler entitled "Child Growth," produced after short notice at the Paramount News studio to demonstrate some European researches in teaching psychology of the pre-school child. The lecturer and demonstrator was Dr. Charlotte Buehler, professor of psychology at the University of Vienna, who chanced then to be visiting New York in connection with the American publication of one of her books. Excluding the unhappily made test films I have just mentioned, it probably was the first teacher-training talkie ever made.

Of course, it was my job to make my own productions as technically perfect as might be; but, whenever I deplored results which had fallen short of their intended effect—and in the circumstances of the time there were plenty of those—Howard Stokes pointed out that the most important consideration just then was to turn out our subjects as rapidly as possible. One or two "perfect" productions, as he said quite rightly, could be of very little use to the clamoring salesmen, whereas they could dispose of complete sets of even average production quality. Accuracy of the basic content was of more concern to them, and, naturally, that phase was the responsibility of the committee.

Accordingly, I rushed through my production schedule as quickly as I dared. There was one awful week in which I personally made six different subjects, most of them single-reelers, however. That this may not seem too incredible, I should explain that probably four out of the six consisted of straight lectures by educators who usually started seated at a library table, and then, as argument warmed up, arose and sat on the table, a

For Varney Clyde Arnsperger opportunity never had to knock more than once—and occasionally not at all. His enterprise has helped the field.

little further variety being provided by shifting camera positions from side to side and using two- three- and four-inch lenses for varying distances.

One of these subjects was the presentation of Mrs. Ina Craig Sartorius, in a series of Binet-Simon tests of children ranging in age from about three to thirteen. Another was of Hughes Mearns, professor of creative education at New York University, an especially delightful gentleman who matched pennies with the cameramen between takes and told me horrendous tales of modern youth. Dr. Mearns brought his wife a few days later to see the "rushes" and, when the screening was at an end, I asked Mrs. Mearns how she liked her husband's performance. She drew a deep breath and answered, "Well, it's Hughes all right; but he looks shinier than I've ever seen him before." My hectic life, you see, was not without its lighter moments.

One of the most notable of the subjects in the early teacher-training category came about in an odd way which I think may be of some importance to the record. An elderly gentleman came to my office one morning and stated that he wished to talk with me about studio scenery. In New Haven, where he lived, he had inquired for information on this subject, and had been referred by Roy Phelps, local non-theatrical producer, to me. It developed that he was Dr. Arnold W. Gesell, celebrated authority on infant behavior, founder and head of the Yale Psycho-Clinic. In his work he used 16mm motion pictures, made by himself, of the babies being studied, through what he called a "one-way vision screen." By means of this device the camera could see the babies but the babies could not see the camera. Now he wished to expand his studies to cover behavior of the toddling child, and he desired to build at the clinic for this purpose a setting which

would seem like a real room to the child, but which would nevertheless permit the use of the cameras from any angle.

As an Erpi gesture of good will toward the Yale University group, I was permitted to visit Dr. Gesell at New Haven and do what I could to assist him. As an especial return courtesy I was shown in fascinating detail the remarkable establishment which he had built and headed, and discussed at length with him his plans for the proposed new studio arrangement. When the conference ended, Dr. Gesell wished to know what he might do in fuller return. He knew, he said, that as a man in business, I necessarily must have something of the sort in mind and what was it? I protested our actual friendly intention, but, having been greatly impressed with the pictorial possibilities of the interesting work which he was carrying on, I suggested the production of a talkie to show it.

Dr. Gesell listened with grave courtesy and gently shook his head. What could be the purpose of such a picture? To advertise his work? He needed nothing of that sort, and, the clinic being sufficiently endowed, no publicity was required there. Moreover, he had once demonstrated in a few scenes for the Pathe Review. His argument seemed conclusive, but I jumped at a straw. The clinic surely had been founded, I reminded him, with the idea of spreading good. Advertising or no advertising, a film made of his work under proper, dignified auspices, would accomplish that purpose, and to deny this suggestion would be to neglect an unusual opportunity. In fact, could he conscientiously ignore what amounted to a duty to the founders? Upon this point he yielded. He then wrote the scenario himself, and I produced the picture with Roy Phelps as cameraman and with Dr. Gesell speaking the running narrative. It became one of the most successful items in the teacher-training series, and it led to making public an entire set of Dr. Gesell's experimental records.

One of his assistants at the Psycho-Clinic then was Dr. Alice V. Keliher, who later became well known to the

visual instruction field. She it was who prepared certain teacher's handbooks for use with the lantern-slide courses of Keystone View, of Meadville, Pennsylvania. Another of Dr. Gesell's assistants, in charge of his special film laboratory, was Jules Bucher, who was to gain reputation as a cameraman-director with Julien Bryan. Working for Bryan in subsequent years, he travelled widely through Russia and Latin America, producing some admirable, useful pictures.

### Staff in Hand

AT ABOUT the time that Stokes had decided to take on an assistant, Arnsperger also had felt the need of one. Accordingly he summoned from Oklahoma his friend James A. Brill, former director of high school music at Oklahoma City. Brill proved to be a frank, likeable soul of the Will Rogers order, with a genuine, specialized interest in the profession he had left, a love of trout-fishing, and, what probably was of high importance, too, an excellent sense of humor. It doubtless saved him from taking many subsequent situations too seriously. He had had some experience with amateur dramatics and quickly developed a creditable knack of composing pedagogical scenarios.

Brill was Arnsperger's first assistant after Stover, but he was not long the only one. Now that we had an impressive list of teacher-training subjects, shown triumphantly at various teacher conventions, and the committee was planning pictures to be produced in various lines of study, there naturally was plenty of research to be done in the line of curricular needs and subject matter of individual units, and in the preparation of teaching handbooks to accompany the films. This justified staff expansion, and, of course, there was at that time plenty of money to make staff expansion possible.

One of the most discussed subjects for possible utilization was the study of languages, so, after Brill, who had been responsible for the well-planned set of reels on music appreciation, there was engaged as a new research assistant, Max R. Brunstetter. He was former principal of the high school at Millville, New

Among Erpi's "research associates" Melvin Brodshaug majored in natural science; Edgar Stover in educational experimentation; and Howard Gray in social science and teacher training. Stover was first to be engaged. Portraits from left to right.

Left to right: Max R. Brunstetter, research associate in vocational guidance; Laura Krieger Eads, tests and measurements and elementary social sciences; and James A. Brill, the fine arts.

Jersey, where he had done interesting work in developing techniques for teaching French and Spanish. A graduate of Dickinson College at Carlisle, Pennsylvania, in 1922, he had received his M.A. from the University of Pennsylvania in 1928, and was to gain his Ph. D. from Teachers College, Columbia University, in 1930. Came next, in quick succession, Howard Gray, specialist in social science and teacher-training; Melvin Brodshaug, expert in natural science teaching; and Laura B. M. Krieger—later Mrs. Eads—to make tests and measurements in the elementary social sciences. Edgar Stover's work was ticketed as the field of experimentation, and he was set to work with Miss Krieger to devise and to conduct tests. Howard Gray was a native of Colorado and, in 1926, a graduate of the University of Montana. His M.A. and his doctorate both were gained at Columbia, from Teachers College, the latter just a few months before his coming to Erpi.

These educators were uniformly a sincere, able, hard-working body. They had won schoolmen's accolades. Miss Krieger, Howard Gray and Melvin Brodshaug were Ph. D.'s, each with a right to be addressed as "Doctor." Brunstetter had most of his counts and became a Ph. D. in the first year of his presence at Erpi. Brill and Stover had mere A.B.'s, but both were thinking seriously of trying for the hood. Devereux was a Ph.D., and even Stokes was an A.B., well on his way to a master's degree from Colgate, and listed in *Who's Who*, beside Arnsperger, at the close of 1931, was still only a bachelor of arts, but he went to Columbia University during odd times during his busy days, and, after meeting the inflexible requisite of hours of study, became a doctor, too. His thesis, *Measuring the Effectiveness of Sound Pictures as Teaching Aids*, using the materials provided by his current employment at Erpi, was issued in book form by the Bureau of Publications of Teachers College in 1933.

All of this learned activity naturally provided additional grist for the production department mill, and, of course, it never would do in the circumstances to have defections there. So Stokes was

obliged to enlarge his own staff also. With his permission and approval I took on Don W. Bartlett, who had been working fitfully as a free lance film editor since his return from his Canadian experience with Bruce Bairnsfather; Richard F. Chapman, who had fallen on lean times with the receivership of Fox Films and the collapse of sponsored pictures at Paramount; and Charles Brooke, who had been my assistant in production since my association with Carlyle Ellis. Consequently, the production department became rather imposing, too.

Arnsperger was especially disturbed that in making the original educational talking pictures at Erpi the production authority was not completely in his own hands. But then, the production department was not without its own ideas on education. This is interesting to remark because it represents the recurring situation in every educational film enterprise that ever existed. The educational head of an educational program is generally obliged by his own ignorance of film procedures to divide his authority with a motion picture man. Stokes had known non-theatricals for a long time. He had been aware that this natural difficulty must arise and had anticipated it by insisting from the first that one of Arnsperger's research assistants should be present in every production period to decide pedagogical questions which might come up. Stokes, with malice towards none and sufficient charity for all, believed then, as always, in the supreme merit of minding his own business and leaving all else to the divine course of nature. He was quite right. In proper time nature was to give Arnsperger a production facility of his own and to return Howard Stokes to his first love, his office at the A.T.&T.

To be sure, a compromise spirit was needed on both sides. We, of the production division, with some practical experience in writing and staging films for industrial and social service purposes, had naturally reached certain conclusions about the effectiveness of techniques in conveying useful ideas via the screen. When a subject was of itself rather commonplace, and could not be given a fresh approach in imparting arresting informa-

tion, we deemed it worthwhile to build up the interest by devising an attractive form of presentation. But we were to discover that our educators wished to avoid such additions as injections of elements disturbing to the lesson. We were to learn that, while modern education seeks to integrate new knowledge in the pupil's experience, it was frowned upon to integrate the pupil's experience in the new knowledge, as we would do in following approved methods of the theatre. Above all, we discovered that educators, as a class, shunned aroused emotion in the learning process whether it improved attention or not.

### Production Research

AN instance, to show the dilemma which arose in this respect, was in the group of four subjects known as "The Music Appreciation Series," planned and executed with the supervision of James Brill. We began the series with a reel on the woodwind choir, a lecturer standing with the musicians and frankly explaining the instruments individually and in combination. This was the very early period, when the lecture technique for a teaching film was virtually the only one generally approved. Brill's interesting text for the lecture referred to the piccolo as the comedian of the choir, and, when I came to the closeup of the piccolo, I animated the instrument so that as it squealed it apparently wriggled of itself on the music rack to the comic consternation of the lecturer and musicians. This touch was well received, and we were encouraged to explore possibilities further.

At about the same time I had varied the straight lecture technique of Joe Coffman and others by having interpolated scenes, consisting of stock film and sometimes material especially staged, with the lecture continued over them. Of course, this had already become familiar practice in the industrials, but when I thus "illustrated" the long talk of Hughes Mearns on "Creative Education," using an acted episode, it was an almost sensationally new technique for this purpose, and the subject was authorized to be made only after many qualms and misgivings. But, each time I essayed a new way of doing and found it effective, I naturally was anxious to explore further and to make these experimental pictures experimental from the production side as well. Those early films may seem rather quaint now; but, in the light of their undeveloped times, some of them were distinctly progressive.

Brill, whose experience with amateur dramatics made him considerably less word minded than some other teaching authorities we knew, always shared this attitude with enthusiasm, and assisted us greatly in breaking down the natural conservatism of the committee. But we had one serious setback which for a time put a stop to any developments of this nature. It was when we came to the second subject in Brill's music series.

(To Be Continued)

## Summer Courses in Visual and Audio-Visual Education, 1944

The following list supplements that which appeared in April. Figures in parenthesis show semester or quarter credits.

<b>California</b>	
Humboldt State College, Arcata	June 26-July 27
Workshop in Audio-Visual Aids	Mrs. Alma Thompson
<b>Illinois</b>	
Wheaton College, Wheaton	July 24-Aug. 18
Visual Aids (2)	Robert L. Cooke
<b>Iowa</b>	
Iowa State College, Ames	June 12-July 19
Visual Methods in Education (3)	A. P. Twogood-H. L. Kooser
<b>Kansas</b>	
University of Wichita, Wichita	June 5-16
Workshop in Elementary Education will emphasize Visual Education	W. A. Bonwell
<b>Kentucky</b>	
University of Kentucky, Lexington	July 20-Aug. 26
Visual Teaching (4 qr.)	Louis Clifton
<b>Louisiana</b>	
Louisiana State University, Baton Rouge	June 9-July 22
Audio-Visual Aids (4 qr.)	Mary Clint Irion
<b>Maine</b>	
University of Maine, Orono	July 5-Aug. 11
Motion Pictures in Education (2)	Paul S. Miller
<b>Massachusetts</b>	
State Teachers College, Hyannis	July 6-Aug. 15
Audio-Visual Aids to Teaching (2)	Earle S. Collins
<b>Michigan</b>	
Central Michigan College of Education, Mount Pleasant	
Visual Education (2)	July 3-Aug. 11 W. C. Smith
University of Michigan, Ann Arbor	July 3-Aug. 14
Visual Sensory Aids in Education (2)	F. Dean McClusky
<b>Missouri</b>	
Central Missouri State Teachers College, Warrensburg	
Audio-Visual Education (2)	July 3-Aug. 25 Byron Westfall
<b>New York</b>	
Chautauqua Summer Schools, Chautauqua	July 10-Aug. 18
Laboratory Course in Visual Aids I and II (2 qr. ea.)	Mary Molyneaux
Syracuse University, Syracuse	July 3-Aug. 12
Visual Education (3)	To be appointed
<b>Oklahoma</b>	
The University of Oklahoma, Norman	July 17-29
Visual Aids Workshop (2)	W. B. Ragan—Betty Blanton—Weldon Brown
<b>Pennsylvania</b>	
Muhlenberg College, Allentown	July 5-Aug. 30
Visual Instruction (2 or 3)	John E. Trainer
<b>Texas</b>	
Southwest Texas Teachers College, San Marcos	July 17-Aug. 25
Audio-Visual Education (3)	Ruby Henderson
<b>Virginia</b>	
State Teachers College, Farmville	July 24-Aug. 26
Audio-Visual Education (3 qr.)	E. M. Johnson
University of Virginia, Charlottesville	July 3-22
Workshop in Visual and Auditory Aids (2)	John A. Rorer
<b>Washington</b>	
Central Washington College of Education, Ellensburg	
Audio-Visual Education (2½ qr. for 1-month course, or 5 qr. for 2-month course)	Edward B. Rogel
Western Washington College of Education, Bellingham	July 20-Aug. 18
Visual Aids (3 qr.)	Fred W. Knapman
Construction and Use of Visual Aids (3 qr.)	Charles M. Rice
<b>Wisconsin</b>	
University of Wisconsin, Madison	June 24-Aug. 18
Visual Education (3)	W. A. Wittich

## Workshop in Visual Education For the Religious Field

THE first North American Workshop in Visual Education for church workers will be held at Garrett Biblical Institute, August 28 to September 2, Evanston, Illinois.

There is a rising tide of interest in the use of visual method by churches. Despite the shortage of equipment, there is an increasing use of the film material that is now available. After the war when equipment is released there will doubtless be an upsurge in the use of visual materials and method. Wise guidance is essential if the interest and resources of local churches are to be used most effectively both now and after the war.

There is great need for persons equipped to teach courses in visual education in the 700 schools for church workers scattered over the country. Leaders are needed to organize and hold conferences and institutes, to serve as chairmen of committees of visual education in local churches, in state and city councils and in denominational staffs. The Workshop to be held this summer is encouraging the discovery of such potential leadership on the part of denominations, state and city councils and local churches. One outcome of the Workshop should be the beginnings of a field leadership in visual education.

This conference is being conducted under the auspices of the International Council of Religious Education which is the official organization through which 40 denominations and about 110 state and city councils work together in Christian education. Its constituency includes about 80 per cent of Protestantism and it corresponds in the church school field to the American Council on Education in the public school field. The administrative committee for the Workshop includes such persons as Rev. William Rogers and Dr. Paul H. Vieth. The persons invited to attend the Workshop are: national staff members, committees responsible for visual education, age group workers, area and council executives, supervisors of church schools, pastors, directors and professors of religious education.

Throughout the conference attention will be given to all kinds of visual aids including motion pictures and slides but, also, including the use of prints, murals, school journeys, maps, worship centers and other non-projected visual aids. The program will include a Seminar on the whole field of visual education in the church, "functional work groups" for special groupings of leaders; production groups in script writing, in simple motion pictures and slides and in non-projected visual aids. Guidance will be given in operating projectors. Demonstrations of methods and review of films will be provided. The very best leadership of the country is being secured for each item in the program.

This first North American Workshop should be a foundation stone for an increasingly adequate total program of visual education for the churches. Facilities are limited so that advance reservation is necessary. Inquiries should be addressed to Dr. Mary Leigh Palmer, 203 North Wabash Avenue, Chicago 1, Illinois.

MARY LEIGH PALMER

# SCHOOL MADE MOTION PICTURES

**HARDY R. FINCH, Editor**

Head of the English Department  
Greenwich High School, Greenwich, Conn.

Your editor is pleased to present in this column a comprehensive account of the University of Minnesota Film-making, secured through the cooperation of Paul Wendt, visual education director who has supervised the production of several unusual films during the past year.

## University of Minnesota Productions

**A**LMOST a year ago the three reel 16mm. color sound film on the curricula of the School of Nursing called *Nurse Student in Wartime* was released for distribution. This film was designed to inform prospective candidates for the School of Nursing on the content of both the three-year and five-year curricula leading to degrees.

The first few scenes of the film show a freshman having conferences with Miss Densford, the director of the School of Nursing and outlining her plan of study. Then follow in rapid sequence scenes from many classrooms, laboratories, and study halls where the same student is shown hard at work. Types of recreation that nurse students are encouraged to enjoy are also shown. Distinction between the two curricula is clearly made by means of a large wall-size course diagram located in the School of Nursing office.

When the student has completed her preliminary studies, she enters into fields of specialization such as X-Ray Therapy, work with psychiatric patients, community nursing, etc. The variety of specializations shown here in juxtaposition presents the new student with a graphic over-view of the opportunities open to her. The last part of the film shows some of the other opportunities open to nurses such as employment with airlines, industrial nursing, and other fields. The film closes with a short sequence on the importance of nursing to the war effort. Several scenes in this sequence are devoted to the new Nurse Cadet Program and its colorful uniform.

Before the war the School of Nursing regularly provided speakers to visit high schools and other organizations whose members might be interested in entering the School of Nursing. Within a short time after the opening of war, it was evident that the School of Nursing could not provide staff members for these duties, and the color sound motion picture was made to do most of this recruitment work. Since the film was released, it has been booked solidly without interruption.

The production was under the direction of John L. Hamilton, assistant director of the Visual Education Service, and under the technical supervision of Mrs. Christy Hawkins of the School of Nursing. The method of production followed the usual procedure of film production at the University. Mr. Wendt, Mr. Hamilton, and Mrs. Hawkins first prepared a subject matter outline of the content that the proposed film

*With a question box on the making of  
school film productions, conducted by*

**DAVID SCHNEIDER**  
Evander Childs High School, New York City

should contain paralleling the two courses of study. Then Mr. Wendt and Mr. Hamilton visited representative nursing classes and laboratories in order to determine more exactly the camera angles with the aid of portable view finders and to plan in advance the blocking in of the lighting of each scene. These specific camera directions were then incorporated into a shooting script. In the meantime, a search was made among the students in the School for four girls who would play the leading parts in the film. Many candidates were interviewed, and those selected from this large group were screen tested in color, both in medium shots and close ups. In the meantime, Mr. Hamilton and Mrs. Hawkins had written a commentary to accompany the film and when this was accurately timed, shooting began.

The shooting schedule actually took two months of intermittent photography followed by one month of editing, recording, and synchronizing and release printing. Since most of the nurses' activities are indoors, the production called for an unusual number of interior scenes. Since the film was in color, the interiors

Top: Recording commentary on film on toothbrushing.  
Bottom: University production crew in action.

called for the use of all the 5,000 watt and 2,000 watt Fresnel lighting units in the Visual Education Service studios. Finding the power necessary to run between twenty and thirty thousand watts of lighting constituted a great problem in most buildings which were never planned for a current consumption of 300 amperes. However, one factor tending to make lighting easier was the fact that slightly under-exposed color originals tend to make the most faithful color duplicates.

Another production completed during the last year was a two reel 16mm. color sound film on the technique of toothbrushing called *Your Own Teeth*. This was sponsored by a local toothbrush manufacturer and was made under the direction of Dr. Raymond Johnson of the School of Dentistry of the University of Minnesota. The film is done entirely in animation designed and executed by Karel Dodal, a Czechoslovakian artist working for the Visual Education Service. Mr. Dodal had years of experience in production of animated motion pictures in Czechoslovakia before coming to this country.

The purpose of the film is to show, carefully and in detail, the correct way of brushing the teeth and the gums. After a brief introduction on the cause of dental decay, the film takes up one by one the different techniques that should be employed in brushing different parts of the mouth. Particular attention was paid to the correct angle of the brush and type of brush stroke to be used in brushing between the teeth. The film ends with a short sequence of animated charts showing the proportionate numbers of people who lose their own teeth in successive decades of the life span, and the small percentage of people living to old age who retain their own teeth.

The production of an all-animation film in color and sound was an ambitious undertaking for a university. Mr. Dodal and six artists took several months to complete the thousands of individual colored drawings, called "cells", which when photographed occupy only ten minutes on the screen. There was liberal use of delicate air brush techniques. The technical problem of perspective was especially difficult in many scenes inside the mouth. Most of the scenes in *Your Own Teeth* would have been impossible to photograph in real life. By using animation, not only was it possible to present the teeth in angles which were best for photography, but also by means of such devices as showing some teeth temporarily transparent, it was possible to explain inter-dental brushing with great clarity.

The production staff is at present in the midst of shooting a four reel 16mm. color sound film for the University on the training of the Armed Units on both campuses. This involves the Electrician's Mates, Machinist's Mates and the V-12 Program for the Navy. For the Army, it involves the Pre-Flight Corps, the Pre-Meteorology Unit, and the ASTP Units in German, Swedish, Finnish, and Japanese, and advance engineering. In addition are ESMWT Units, a group of Curtiss-Wright Cadets, some women being trained for the Signal Corps, and the large Nurse Cadet Program. The film will show the classroom instruction, the barracks life, the messing, and recreational activities of all these units. The film is being produced

primarily as a historical record, but it is anticipated that it may also be circulated throughout the state as a report to the citizens of part of the war effort of the University.

The last year has also seen more shooting for the general film on University activities which has been in production for several years. This is a kind of news-reel record of outstanding events to which additions are being made continually.

Another production activity which goes on intermittently is the photographing of films which might be called research records. Whenever a doctor in the Medical School has an unusually interesting case whose symptoms involve motion, the Visual Education Service dispatches a movie photographer to make a record of the patient. Similarly, other research at the University often involves a motion picture record. The teaching staff at the University has become accustomed to using motion pictures in research, and plan their use for this purpose as naturally as the use of other laboratory facilities.

#### QUESTION BOX ON SCHOOL FILM PRODUCTION

**Question:** I am planning to invest in a screen for home projection of my 16 mm. films. Are there any factors I should take into consideration in order to make an intelligent purchase?

**Answer:** The kind and size of screen you should get depend upon the optical system of your projector, and upon the length of your room—the distance between projector and screen.

Projection screens are usually of three kinds. Those made of white cloth are known as the diffuse or matte. The emergency, home put-up screens of table cloth or window shades are not as good for the simple reason that the home products do not reflect sufficient light to really bring out all the brilliant images. The next time you watch a film projected on a home improvised screen stand in back of that cloth. You can see the not-so-bright pictures almost as well from the back as from the front views. A good matte screen has a sufficient opaque projection surface to prevent light from leaking through. The disadvantages of the matte screens are that they eventually become yellowed with age, thereby reducing contrasts in the picture and upsetting any color balance whenever Kodachrome films are projected. This type of screen requires a high unit of illumination, about 16 foot-candles. This means a projection lamp of higher wattage.

The second type of screen is known as the beaded kind. This screen consists of a base of white cloth upon which minute glass beads have been attached. This surface can be kept clean by carefully removing any dust or dirt with a damp cloth. Since glass beads reflect more light than plain white cloth it stands to reason that the unit of illumination will be less—approximately 8 foot-candles.

The smooth aluminum-coated, as well as the silver surfaced screens constitute the third group. With these screens and good lamps under-exposed pictures may show up to advantage. Of course normal pictures can be projected with a minimum of light. The unit of illumination is about 4 foot-candles.

Since beaded as well as smooth surfaced screens reflect light more strongly in the direction of the projector, it is advisable to seat the audience within an angle of about 15 degrees on either side of the projector. Therefore, if your room is long, you will get better results with screens of the second or third groups.

It is best to remember that a small, bright picture is far more enjoyable than a large dull one. Assuming that you have a 2-inch projection lens, and the distance between projector and screen to be about 18 feet, the size of your picture should be about 30 x 40 inches. Based on the laws of illumination, at about half the distance your picture would be 15 x 20 inches and about four times as bright.

# The RCA TUBE PICTURE BOOK

Especially prepared for use in modern schools to provide visual education in the constructional details of representative receiving, transmitting, cathode-ray and special tubes. Each book contains 8 big illustrated tube charts printed on one side of the sheet only—to facilitate their use for display mounting.

**10¢**  
Per Copy

★ BIG 11 x 17 PAGES—EIGHT CHARTS SUITABLE FOR MOUNTING

And for School Science Departments

# THE NEW RCA TUBE GUIDE...

An indispensable aid when it becomes necessary to order replacement tubes for school radio or sound equipment. This new directory contains a listing, in numerical-alphabetical order, of all 304 RCA Receiving Tube types—and in most cases one or more substitution types which can be used as replacements. Notations (with clear, detailed explanations) of the space limitations and the wiring, filament- or heater-circuit, and socket changes involved in making the substitutions. Sample calculations of series and shunt resistors in heater strings. Suggested substitutions are cross-indexed and keyed to cathode voltages and functional groupings tabulated in the "Classified Chart of Receiving Tubes" which is also included.

## Parent Education Through Visual Aids

by JOHN GAMMONS READ

Rhode Island Collge of Education, Providence

If we are to have our school children alert to changes in the world economic structure, their parents must be ready to change the family's concept of the place of the United States in a world brotherhood and world community. That community is in fact already here. We teach the children and wait for them to grow into senators and business men, statesmen and teachers. We must begin with their education now, and we must have parents prepare the way. A new idea, in this parent-conditioning, using the quick-teaching visual aid called an "Institute," is being used by Rhode Island College of Education.

The Geography-Science Departments sponsor a city or town Institute in cooperation with the school department of the place where the Institute is to be held. The theme is world community, achieved through a better knowledge, with the aid of geography, of the needs and problems of all countries. The community of all nations can be implemented, for the first time in history, if science is free to produce materials and have them move where they are needed.

On the evening of the Institute, after a mid-day professional meeting of all the teachers of the town, the parents come to the Institute. They find there exhibits on all phases of science, made by Rhode Island College of Education students, and by students of the local school system. Great quantities of reading material, from those companies all over the nation which have science or geographic backgrounds are available for free distribution to teachers and parents. Maps and posters from other countries cover the walls. Kodachromes are projected by consultants, high school girls who care for each exhibit. A survey has been made of the geographic and scientific environment of the town, and photographs are transferred to glass and tinted, then illuminated, museum-style, from behind. Local industries tell of their scientific and geographic backgrounds. High school students tell visitors about the industrial exhibits. There is no "selling" of products, but of ideas.

Then everyone goes to the assembly hall, to see movies of scientific advances being made; in industry and agriculture, to see how people live in far-off lands. Short explanatory talks by the professors of science and geography explain the purpose of those subjects and of the Institute. A pageant, that most effective aid for teaching the parents of children who appear in the stage presentation, depicts life in other lands. The orchestra and a singer show our debt in music to other days and other peoples. The College choir standing in front of a great map of the world, closes the program with folk-songs of all the world.

Visual aids are combined into a whole, doing that job that needs so desperately to be done soon—preparing our children and their parents for the hard road of peace. Try this new use of an old aid, famous for years as an educational method, used by Horace Mann and Henry Barnard, sweeping the country as the Chataqua. We hope you'll find the same response that we have—thongs of parents coming into the schools to learn about the world today, to learn how to prepare for tomorrow.

## Visual Aids in Industrial Training

THE important role visual aids can play in industrial training was demonstrated to our visual aids class recently, when the students viewed *Ships for Victory*, a thirty-minute, natural color sound motion picture, produced at the Bethlehem-Hingham Shipyard, Hingham, Massachusetts. The film highlights some of the streamlined mass production methods used in supplying the Navy with Destroyer Escorts. It shows how one of the country's largest shipyards met and solved training and construction problems under war time pressure, and followed through to establish shipbuilding records.

The visual aids sequence of the film points out that, "the use of slides, motion pictures, and filmstrips are important factors in the necessary streamlining of our training methods. These are an integral part of all the courses. Experienced operators project these pictures in the classrooms. The function of our film service has been expanded to include showings of safety, fire prevention, industrial incentive and official Navy films to our workers. Including training films, over seven thousand showings have been made. Visual aids have saved untold hours in teaching our workers. Over one-hundred training films have been secured from outside sources. This material did not demonstrate all required shipyard trades, so it was necessary to make our own pictures covering those subjects. Our staff is now prepared to handle all steps of production, from script to completed picture."

The production and twenty-mile radius distribution of such films are additional functions of the Visual Aids Division of the Training Department, Bethlehem-Hingham Shipyard, Inc.

## Connecticut to Establish Safety Film Library

The Connecticut Highway Safety Commission is now making plans for the establishment of a Visual Education Film Library. This library will supply the schools of the State with the latest visual aids in the field of safety education. The services of this library will be free to all schools of the state. The plans also call for the library to supply projection equipment to those schools needing it for the use of these materials. The library is to be under the direction of William M. Greene.

## New England Notes

*Spring Meeting Cancelled.* At a meeting of your Board of Directors held at the Hotel Lenox in Boston on April 1st, it was decided to cancel the spring meeting for this year. It is our plan to arrange for a meeting in the early fall.

▲ ▲

The Audio-Visual Aid Center of the University of Connecticut has a supplement to the regular catalogue. The supplement will list approximately 200 new films that have been added to the library within recent months. Included in this are more than 50 additional Erpi film subjects as well as a number of sound and silent films suitable for the elementary grades. This supplement will be available June 1.

▲ ▲

We would like to call your attention to the Geography-Science Bulletin, which is published monthly by the Rhode Island College of Education and edited by Professor John Gammons Reed. This bulletin should be of particular interest since it not only gives a considerable amount of information on Geographic and Science subjects but also devotes an entire section to the evaluation of new film releases and other teaching aids in these fields.

*...the Airplane is in the Classroom!*

**1,742  
LIGHTED PICTURES  
MAKE PRE-FLIGHT AERONAUTICS  
EASIER FOR ALL**

Pre-flight Aeronautics instruction is here to stay and Pilot Training in schools and colleges is here to stay. Military aviation, Civilian Transport and Freight Flights exceed the most optimistic expectations of 10 years ago and point the way to tremendous expansion of air facilities after the war with a corresponding increase in demand for Pre-flight Aeronautics training.

Hundreds of Jam Handy Pre-flight Aeronautics Pilot Training Kit-sets are now in use in leading schools and colleges . . . and more are constantly being applied. 1,742 lighted pictures in 24 slidefilms provide a complete step-by-step visual explanation of each phase of aviation.

Original pictures, photographs, cross-sectional views, drawings, diagrams and charts comprise this Pilot Training Kit-set. Each picture is captioned for reading aloud by teacher or student. Each can be held on

the screen while difficult points are made quite clear.

Try These Slidefilms Without Obligation . . . See for yourself this Jam Handy Pre-flight Aeronautics Kit-set. If you are teaching Pilot Training, mail the coupon below to find out how you can have a free 10-day trial in your classroom. Or, you may order the complete set of 1,742 pictures in 24 slidefilms for only \$65 . . . now.

# The Literature in Visual Instruction

## A Monthly Digest

ETTA SCHNEIDER RESS, Editor  
New York University Film Library

### PRODUCTION-UTILIZATION

**Getting Underway**—Lt. Francis W. Noel, USNR—*The School Executive* 63:29 February, 1944.

This is the first of a series of three articles on the use of audio-visual aids in the navy training program. It outlines the organization of the Training Aids Section in the Bureau of Naval Personnel, which was set up in the summer of 1942, thus giving recognition to the place of audio-visual instructional materials in training. The formation of this Section was most significant in that for the first time centralized overall direction of the Navy audio-visual education movement was possible. The enormous scope of its activities required the section to be organized into three sub-sections: (1) production planning and new development of aids, (2) distribution, and (3) utilization and evaluation.

**Full Speed Ahead** (part 2—p. 29, March) is concerned with the administration of the navy visual program.

The Training Film Section in the Bureau of Aeronautics provides the entire naval establishment with photographic training aids. It does not itself initiate production. All requests for production originate from some training activity, must be specific in terms of definite training needs, and must be approved by the Bureau of Naval Personnel. To date more than 250 million feet of 16mm positive film have been used for film-strip and motion picture subjects.

Smooth distribution has been achieved through training aids libraries established in each of the naval districts, naval training stations, and at foreign ports. An extensive utilization and evaluation program has also been developed. This is under the supervision of approximately one hundred utilization officers, experienced in the audio-visual education field, who are especially trained to carry out this part of the program.

**Plotting a Course for Education** (part 3—p. 45, April), which concludes this series, points out that the experiences gained from the Navy's training aids program, which is essentially the work of professional educational personnel serving as wartime officers, will have great significance in American education. The organization and development of this program is based upon principles derived from American educational experience during the years of peace. The Navy training aids program has not remained static. New ideas are constantly being put into practice, scientifically evaluated and continually improved. Lt. Noel discusses twenty-one implications of this development to education. "The first and probably the most significant implication is that after the war American education can look with confidence to its own ranks for personnel qualified to assume leadership in a sound post-war development of the audio-visual movement in the United States."

**The Work of the Training Film Branch, Photographic Division, Bureau of Aeronautics, U. S. Navy**—An Overview—Lt. Orville Goldner, USNR, Head of Training Film Branch—*Journal of the Society of Motion Picture Engineers*, 42:71 February, 1944.

The Training Film Branch of the Navy is responsible for the procurement, production and distribution of training films for all activities of the Navy. Since its establishment in October, 1941, the Branch has supervised the production of approximately 2000 titles, including both slidefilms and motion pictures, covering every aspect of Naval training. It is organized into five sections, Procurement, Cataloguing, Distribution, Project Supervision, and Education, the functions of each of which are described. Two hundred persons—civilians, enlisted men and officers, work for the Branch. Facilities of commercial producers are used in addition to

the Navy's own production laboratory at the Naval Air Station, Anacostia, D. C.

Other articles in this issue treating various aspects of the Training Film Branch activities are: "Production Planning for Navy Training Films," by Lt. R. B. Lewis, Senior Project Officer; "Making Films that Teach," by Lt. Reginald Bell, Head of Education Section; "The Training Film Program in Action—A Case History," by Howard E. Carr, Edward Nell, Jr., and Thornton Sargent, Lieutenants.

**The Use of Films as a Teaching Aid**—Robert E. Schreiber, Stephens College, Columbia, Mo.—*School Science and Mathematics*, p. 59 January, 1944.

Last year Stephens College used over 4,000 reels of motion pictures, which represented 800 hours of film showings, or 3.7 hours per day, allocated among the 300 classes which meet daily. The library and Visual Aids Office cooperate in informing instructors at Stephens as to what films are available to them. Assistance is also given the faculty in film selection, projection service, methodology and evaluation. Extensive card indices are maintained for the use of the faculty. Source cards giving the physical characteristics of the film and subject areas to which it is applicable, are filed alphabetically. From these cards, course—or, subject area—cards are made out for as many divisions of study as are indicated on the master form. These course cards are then sent to the Division Libraries throughout the campus. A file of course cards is also kept in the Visual Aids Office, classified according to subject areas. Following every film exhibition, evaluation cards are filled out by the instructors and filed with the corresponding course cards.

Another important function of the Visual Aids Office is the personal contact work to win over new converts to the idea of using films as a teaching aid. But, this accomplished, they do not consider the job done and forget about the new convert. He must be guided and stimulated until the use of films is firmly established as a part of the instructor's methodology.

### DISTRIBUTION

**16mm Exchange Practices**—B. A. Aughinbaugh, Director Ohio Slide & Film Exchange, State Department of Education, Columbus—*Film and Radio Discussion Guide* 10:5 February, 1944.

"How to Stop Film Deletion by Customers" is the problem discussed in this second installment of Mr. Aughinbaugh's series of articles which began in January. (The first one, on "Unsatisfactory Reels," was reported in our March issue.) By embossing the beginning and end of every film splice made by the Exchange, customers' splices are detected readily. They are removed and a new one made. The deleted section is charged to the customer on a footage basis. This splice-marking system exposes those users who damage or remove scenes from the films.

"That Old Alibi: 'We Didn't Use It'" (p. 5, March) tells how to prevent arguments between the Exchange and customer as to whether a film was used or not. If for some valid cause, film is to be returned unused, there can be no reason for it to be opened. Most rental exchanges charge for films whether used or not, but that does not take care of possible damage assessments unless there is a damage insurance charge included in the rental. To meet this eventuality, the Ohio Exchange wraps a "one-time band" completely around the film and the inspector signs her initials over the pasted end in dry, indelible pencil. The band carries the warning that if the band is broken or the signature is blurred, the exchange will consider the film used.

(Concluded on page 218)

# TESTING NOW!

## For Peacetime 16 mm. Projectors

For over two years, thousands of AMPRO 16 mm. sound projectors have undergone gruelling tests—from arctic wastes to South Pacific jungles, on aircraft carriers, destroyers, submarines—under blazing sun and in subzero temperatures. Out of this cruel laboratory of war have come sturdy, practical 16 mm. projectors exceeding even prewar AMPRO efficiency. Today these "war-tested" AMPRO machines are being made now exclusively for the United Nations armed forces. *When peace comes—they will be available for increasing the effectiveness of visual education.* Write today for Ampro catalog of 8 mm. silent and 16 mm. silent and sound projectors.

## RESEARCH

**Visual Instruction in the Teaching of the Secondary Sciences**—Charles C. Graham, Berea College, Kentucky—*Science Education* 28: 25 February, 1944.

After quoting statements made by various educators, from Comenius to the present, concerning the value of the picture in the learning process, the author goes on to review very briefly seven investigations which have been made to determine the value of visual aids in teaching secondary science. Each of these studies showed that the experimental group, with which films or slides were used, learned more than the group taught by the ordinary classroom methods.

The writer recently made a sampling study of the teaching of general science in the secondary schools of forty-five schools located in ten states, with special emphasis on Kentucky, and found that 30% of them own 16mm silent motion picture projectors, 15.5% have 16mm sound, approximately 10% have 35mm projectors, and 44.4% own slide projectors. Teachers of science were found to make greater use of visual aids than do teachers of other subjects.

### Some New Releases of USOE Visual Units

BY releasing a new series of fifteen industrial training 16mm. sound films depicting marine construction, the U. S. Office of Education is helping to speed the program of the greatest shipbuilding year in the history of the country. These reels, coordinated with silent film strips and manuals, are additions to the ten motion pictures on shipbuilding skills already in use in navy and shipyards throughout the country.

Other new reels which have been completed and added to the visual unit groups are five films devoted

series

## PERIODICALS

**Electronics**—*Building America*, vol. 9 No. 3. Department of Supervision and Curriculum Development of the National Education Association, 2 W. 45th St., New York.

The story of what electronics is, its importance on the war fronts, how it serves on the home front, and what it promises for the post-war world, is told in simple, non-technical language in this study unit. The story opens with the vital role that electronic devices are now playing on America's battle lines. The science of electronics is then briefly explained by means of non-technical text and several simple diagrams, making it easy for the uninitiated to grasp the basic principles involved.

The publication goes on to trace the historical development of electronics, and discuss its many applications—in the fields of communication and transportation, as a new working tool in industry, as a weapon against disease and accidents, and as a source of new marvels in the home.

The story told in this publication together with the many photographs and graphic charts contained in it, presents a sufficiently broad picture of the field to enable readers to understand the immediate importance of electronics and of its possibilities in the post-war world.

to many phases of farm work, thirteen to machine shop work and eight to aircraft construction. With the increasing shortage of manpower in the rural areas it is believed that training films will prove of great assistance by the instruction given in the maintenance of farm machinery thereby safeguarding the food supply for members of the armed forces and the civilian population.

Utilization of industrial training films in shipbuilding establishments is regarded as one of the important reasons why shipyards have been able to develop greatly enlarged staffs of capable workmen and produce good ships so rapidly. Federal statistics show that training periods are reduced by 30 to 50 per cent.

Produced under the supervision and direction of Floyd E. Brooker, visual aid director, U. S. Office of Education, the latest reels portray some of the intricate operations in shipbuilding, covering the installation of marine machinery, coppersmithing, pipe fitting and insulation. Among these are checking and surfacing foundations; aligning and installing auxiliary machinery; filing and installing choeks; laying out, drilling and tapping flanges on sea chest; installing valves and strainer on sea chest; laying out and installing stern tube, tail shaft, and propeller; bending copper tubing to a wire template; brazing flanges with spelter and silver solder; measuring pipe, tubing and fittings; cutting and threading pipe by hand and by machine; covering hot and cold pipes. Distribution is made through Castle Films, Inc., New York.

"These films, with supplementary animation and commentary, can be used repeatedly, for novices and others who are seeking advancement, for quick instruction and with the least delay in production," said Mr. Brooker. "They convey the knowledge of assembly steps, nomenclature, part identification, markings and supplementary erection procedures with equal clearness. The advantage of them in speeding up the country's war production is obvious."

The motion picture shows the job step by step. The filmstrip reviews, clarifies and supplements the motion picture. The instructor's manual ties motion picture and filmstrip together into an integrated visual training unit.

### The Coolidge Visual Aid Squad Functions (Continued from page 199)

ters isn't taking any chances with his trainee. He insists on nothing less than perfection, for he doesn't want any embarrassment on the day of reckoning. When Witters is assured that his protégé is prepared to stand up for formal examination, he notifies the Chief Examiner, Norton Marshall. The Chief Examiner sets a date for the formal examination, posts the notice on the bulletin board, and cordially invites all members of the V. A. Squad, including myself, to grace the occasion with our presence.

#### The Formal Examination of Joe Neophyte

In the course of our three years existence a sort of ritual has evolved in the examination procedure. On the appointed morning, the Chief Examiner introduces the candidate, and comments with more or less flourish on the importance of the occasion. He then instructs his assistant to blindfold the candidate. The blindfolded candidate is lead to the box containing an unassembled silent movie projector, and is instructed to assemble same. If this part of the examination is completed successfully, the candidate is given a practice film, and instructed to thread the machine with it. The candidate is still blindfolded. In the meantime, the Chief Examiner and his associates are doing their best to make things unpleasant for the candidate. They are applying what is known in our exclusive circle as "Under Pressure Routine". It takes a strong mind to ignore this deliberately induced bedlam. The tumult is supposed to simulate the occasional natural confusion that greets the candidate on his first projection assignments. I have attempted at times to intercede on behalf of Joe during the wilder moments of the "routine", when the barbaric incivilities on the part of the examiners seemed a trifle too severe, but I have been consistently brushed aside by the Chief Examiner, his assistants, associates, and even by the tormented examinee. The examiners refuse to tolerate any interference with a solemn tradition, and the tormented candidate insists on his prerogative to suffer the worst offered. When Joe finally demonstrates that he can thread the silent movie machine under pressure and blindfold, he is accorded a generous round of applause. At this point his blindfold is removed, and he is permitted to step up to the last hurdle in the examination.

He is instructed to assemble the sound movie machine. Since this is a more formidable bit of equipment than the silent movie machine, Joe is permitted to carry on without the handicap of the blindfold. It is only when Joe appears for his senior examination that he is required to assemble the sound machine under blindfold as well as under pressure. When Joe proves his skill with the sound machine, he is accorded a second round of applause, and is presented to me by the chief examiner for official certification. With due solemnity I read aloud the inscription on the certification card, (Form No. 6) and I accept Joe into our organiza-

Reg. U.S. Pat. Off.

# CHALLENGER

**Is the Only Screen That Gives You These Important SAFETY FEATURES**

It is a physical impossibility to rip the screen fabric from the roller in raising the Challenger to desired height. Lifting the Challenger does *not* pull the fabric further from the case and thus necessitate moving up the case separately. All that is necessary is to release the spring latch and raise the extension support. The complete unit (case and screen) is thereby raised to the desired height, where it locks automatically. Positive and foolproof!

Only the Da-Lite Challenger offers these important safety features . . . The Challenger is one of many styles in the Da-Lite line of projection screens famous for quality for 34 years.

**DA-LITE SCREEN COMPANY, INC.**

Dept. 5ES 2723 No. Crawford Avenue  
Chicago 39, Illinois

Raising the Challenger does not change screen proportions. The picture area remains the correct size.

**No Ripping of Fabric from the Roller!**

When the screen fabric of the Challenger reaches the fully opened position, the extension support locks automatically in place, making it impossible to tear fabric from roller.

**No Stoop! No Guessing!**

In raising the Challenger to desired height, the exclusive inter-lifting device lifts the case, roller and fully opened screen as one unit and thus eliminates stooping and guessing about correct screen proportions.

tion with certain rights, privileges, etc. If Joe serves with sufficient merit for one semester as junior member, he will be qualified to apply for the senior examination. Incidentally, to inject a sad note, I might add that occasionally Joe fails to perform according to the rigid standards set up by the examining board. In such an event, both candidate and senior sponsor share alike in the humiliation. One can readily understand why the sponsor is so exacting during the training period of his protege. On such tragic occasions I have tried to intercede on behalf of the outraged candidate, but to the usual no avail. The sponsor may present his unsuccessful candidate for another trial on the following week. Fortunately, on the second trial the examiners are not without a vestige of mercy.

### Special Assignments for the Squad Members

In addition to their regular projection responsibilities several of the squad members perform clerical duties in order to keep the program operating smoothly. The senior members instruct the juniors in the same manner described earlier in this article. We have special clerks to prepare the Confirmation Order, the Assignment Chart, and other small forms. The Inventory Clerk is responsible for the return and accounting of all equipment at the end of the day. The Technician checks for minor adjustments, splicings, etc. And our fair secretary handles correspondence within and outside the

school. Acknowledgement is due to Mr. Paul Hahn of the Coolidge Printing Department. Mr. Hahn has two boys on his staff who do nothing but run off forms for the V. A. Office. Mr. Hahn has expressed nothing stronger than an occasional look of amazement.

### Keeping the Squad Intact

It would be catastrophic if we had to re-organize the squad at the beginning of each semester because of the individual program adjustments. In order to keep the same operator assigned to the same period from one semester to the other, we submit to the assistant principal our request on Form No. 7. This request is honored wherever possible. We try to spread the membership of the squad in such a way as to retain representatives from all semesters, thus guarding against wholesale loss through graduation. To take care of the occasional replacements I am generally able to select a likely candidate from among my lower semester biology students. As usual, scholastic standing is a fair index of dependability, though occasional lesser academic lights make good also. If I am unable to find a student in any of my biology classes with the necessary free period, enthusiasm, or inclination, I make the rounds of the study halls assigned for that period and get my man. Sometimes I pick a mistake. Experience helps here. But by and large the Coolidge Projection Squad ranks as a hardy perennial.

### Care of the Feet

(Encyclopaedia Britannica Films, 1841 Broadway, New York) 11 minutes, 16mm. sound. Sale price \$50.00 less 10% educational discount. Apply to producer for rental sources. Discussion guide available.

This film, divided into three major sequences, presents the new interpretation of the function of the feet and their accompanying disorders as developed by Doctor Dudley J. Morton of Columbia University.

The first part of the film is devoted to the anatomy of the foot, its bony structure, and the distribution and support of the body weight. By means of X-ray photography and diagram, the bones of the feet, ankles, and heels are shown while the commentator explains the relationship of one to the other. A live model illustrates how the weight of the body is shared equally by each of the feet; diagrams explain in greater detail how the weight is distributed to each metatarsal.

The second part of the film analyzes the two chief causes of foot discomfort. X-ray photography points out that the end of each metatarsal bone comes in contact with the ground in its weight bearing function. A short first or second metatarsal throws the distribution off balance, thereby causing pain, malformation, and callouses on the bottom of the foot. Flat feet are generally attributed to lax ligaments and weak muscles; Dr. Morton discredits this theory, asserting that weak bony structure causes the bones to shift out of position causing flat feet. The ligaments and muscles perform their chief function when they maintain equilibrium and institute or control body movements. Illustrations of these common disorders are shown.

The third part of the film deals with the general care of the feet, the wearing of proper shoes, and the importance of rest and relaxation to the comfort of the feet.

**Committee Appraisal:** The committee recommended the film for use by groups specifically trained in physiology and not particularly valuable to groups interested in practical suggestions on foot care since the terminology is very technical and the explanations concentrate on the physics of foot structure. The title would lead one to expect more emphasis on care of the feet, helpful exercises, and the wearing of the correct kind of shoes. Animated diagrams explain clearly the function of each part of the foot and the distribution of body weight to each part. Should be useful to physical education classes and foot doctors.

This monthly page of reviews is conducted for the benefit of educational film producers and users alike. The comments and criticisms of both are cordially invited.

Producers wishing to have new films reviewed on this page should write L. C. Larson, Indiana University, Bloomington, Indiana, giving details as to length, content, date on which the film was issued, basis of availability, prices, producer and distributor. They will be informed of the first open date when the Teacher Committee will review the films. The only cost to producers for the service is the cost of transporting the prints to and from Bloomington. *This Cost Must Be Borne By The Producers.*

### The Bridge

(Coordinator of Inter-American Affairs, 444 Madison Avenue, New York and New York University Film Library) 33 minutes, 16mm. sound. Produced by Willard Van Dyke in cooperation with the Foreign Policy Association. Apply to distributors for a list of depositories and terms governing purchase.

A documentary film depicting the social and economic problems present in the various South American countries and suggesting that air transportation using the bridge of air which brings South America within sixty air-hours of the farthestmost points is the solution to the problems.

The introduction to the film emphasizes the fact that South America is not one place but a thousand. A map and scenes of the palms at Natal, the harbor at Rio de Janeiro, the business district of Buenos Aires, the mountains and the jungles, the mighty Amazon, the soldiers' barracks at Caracas, and the extant remains of the Inca Empire impress upon one the diversity of geographical conditions and peoples present in South America.

Animated diagrams show that World War II has disrupted the pre-war trade triangle which existed with England and the United States and that the ends of the triangle—figuratively speaking—have coiled back on themselves and encircled and thus isolated South America. German, English and Italian ships are shown at a standstill in South American harbors. Month by month raw resources of cotton, coffee, wheat, and corn are piling up in South American warehouses. Or, even worse, are being left in the fields or used as fuel by furnaces in the factories. The United States doesn't need these products, Europe can't get them, and South America is unable to use them because of inadequate distribution facilities and a lack of industrial factories.

The fires of the few industries which burn in South America offer a possible solution to the problem. But nine out of every ten South American have never seen a mine or oil well and live by the labor of their hands. Among these people malnutrition and illiteracy prevail. Scenes show the deplorable conditions under which such people live and work.

Progress is being made in reclaiming vast tracts suitable for agricultural purposes, shifting from one crop to many, developing productive rubber trees, establishing transportation routes, and replacing manual labor by machine. The film ends with shots of a plane being loaded with manufactured products for South America and with the bright promise for the future that by using the bridge of air, South America will achieve economic and social development.

**Committee Appraisal:** A dynamic and dramatic film—artistically photographed and sincerely narrated—furnishes a wealth of material on the peoples, the problems, and the conditions in South America. Some may feel that the solution to South America's economic ills presented in the film is over-simplified. An excellent film for developing an appreciation of the whole of South America, and of the urgency for developing a functional Pan-American policy. Student and adult groups interested in South America will find this a stimulating and informative film upon which to base their study and discussions.

**Abegweit**

(National Film Board of Canada, 84 East Randolph Street, Chicago, Illinois) 11 minutes, 16mm. sound. Purchase price \$15. Produced by Mrs. Margaret Perry for National Film Board, Ottawa, Ontario, Canada. Apply to distributor for rental.

As the commentator explains that the Prince Edward Island was originally known as Abegweit, an Indian name meaning "cradled on the waves," the film opens by showing that part of the island which juts out into the Atlantic Ocean. As the camera presents scenes of the shoreline and countryside, the commentator relates briefly the history of the island. Originally settled by the Indians, the French came in large numbers to fish. In 1758 the English took over the island and focused their activities on agriculture rather than fishing.

The remainder of the film is devoted to the varied activities of the island inhabitants. As men are shown busy at farming duties, the narrator relates that three fourths of the people are engaged in specialized farming of which field crops are the most important. A mother and daughter are shown cutting seed potatoes, a principal export of the island. Men are pictured at work in orchards, in the hay fields, and on the fox farms. Stock and poultry farms with their quality breeds are caught as the commentator explains that in 1925 the action which was taken to rid the island cattle of tuberculosis was successful. In most farming areas cooperative planning and marketing are used. While a rich living is gained from the land, the film also records the activities of the fishermen as they proceed to the fishing areas, haul in their catch, clean and sort the fish. Cooperative effort is again stressed.

The picturesque quality of the island is further enhanced as the film presents the "Ann" country—the green gabled house, the babbling brook, and the haunted wood.

The progress of the island is illustrated by scenes of the regional libraries first initiated by Carnegie but now controlled and supported by the towns. In this way new reading material reaches all parts of the island. The film ends with scenes of Charlottetown, the capital, and Summerside, the center of the fox fur industry.

**Committee Appraisal:** Excellent for providing impressions of resources, products, people, industries, historical background and legend, and a successful application of the cooperative movement. Should be useful for providing a background and information on the inhabitants and occupations of Prince Edward Island in classes in economics, geography, literature, history and in adult groups interested in cooperatives and specialized farming. Good photography and a sympathetic treatment of the subject combine to make this an interesting and enjoyable film.

**Romance of the Gyroscope**

(Sperry Gyroscope Company, Central Film Service, Great Neck, New York) 15 minutes, 16mm. sound. Apply to producer for rental sources and purchase price.

The film gives the history of the discovery of the gyroscope, the laws of physics governing its operation, and its practical applications in the realm of navigation.

Introductory scenes show that the idea of the rolling log led to the discovery of the wheel. Various types of wheels are shown—the ancient Greek, the Roman chariot wheel, a French Seventeenth Century wheel, an early American, and an English pneumatic. The commentator here points out that the transferring of power from one wheel to another caused the machine age to come into being.

Until forty years ago the gyroscope was only a toy. Scientists seeking to solve the mysteries of the rotation of the universe through space discovered the law of force. They found that a wheel at rest did not possess gyroscopic properties, but that the same wheel when spinning would resist a force endeavoring to change its plane of rotation. Leon Foucault, the first to perfect a spinning wheel which allowed him to observe the earth's motion, is shown

## ERPI CLASSROOM FILMS

### Prepare for the World of Tomorrow

#### MODERN CONCEPTS OF WORLD GEOGRAPHY

JUST as in the airplane we can ignore state and national boundaries, so in the modern world our concepts of geography must transcend all such political boundaries. The world must be considered as a great community with all people next-door neighbors.

Erpi Films which will contribute to a realistic understanding of regions and their interrelationships are the 6 in the United States Regional Series, the 4 in the Canadian Regional Series, and the 3 in the Caribbean Regional Series.

Other Erpi Films which will provide the citizen of today with a more intimate understanding of his neighbors of the world are the Erpi Series on People of Other Lands and the Erpi Series on Children of Other Lands.

For Descriptive Booklet Write

ENCYCLOPAEDIA BRITANNICA  
FILMS Inc.

1841 Broadway

New York 23, N. Y.

using his discovery. He named it "gyroscope" derived from two Greek words meaning "to view evolution."

Demonstrations with a spinning top and a rolling hoop show two important properties of a wheel in action—rigidity in space or gyroscopic inertia and precision, the force applied to the axis of the gyroscope tending to change the plane of rotation.

Dr. Elmer A. Sperry, who incorporated these principles in his gyro-compass, is shown at work in his laboratory. Final scenes show practical adaptations of the gyroscope—battleships being automatically steered by the gyro-pilot and their courses charted by the gyro-compass the spinning axis of which is brought into line with the north-south axis of the earth.

**Committee Appraisal:** Good for demonstrating the principles of the gyroscope, its industrial application and its usefulness in modern warfare. Also provides the history of the discovery and development of the gyroscope. The film should be effective in developing an appreciation of the persistent effort devoted by scientists to their research and of the industrial progress achieved through application of scientific discoveries to industry. The committee recommended the film for high school and college use.

#### Series and Parallel Circuits

(Encyclopaedia Britannica Films, Inc., 1841 Broadway, New York) 11 minutes, 16mm sound. Purchase price \$50, less ten percent educational discount. Apply to producer for rental sources. Discussion guide available.

This film, divided into four major sequences, illustrates and explains series and parallel circuits. A series circuit with lamps as resistors in place is shown by a diagram as the commentator relates that the elements in the circuit are arranged to permit only one path for the current. Electrons in motion are shown. A parallel circuit is demonstrated by diagram as the commentator again explains that this is a divided circuit with branches, thus providing more than one possible path for the current. The rest of the first sequence is taken up with the explanation of how the electrons flow and the amperage decreases in the series circuit as more resistors or lamps are included. Using diagrams and equations, Ohm's law is applied.

The second sequence explains by the addition of resistors between conductors in a parallel circuit that the voltage across each branch of a parallel circuit is the same regardless of its resistance and each is equal to the source of the voltage. Equations are again employed to show that the total current flowing in a parallel circuit is the sum of the current flowing in the branch circuits. The total current increases in the parallel circuit as more resistors are added. Ohm's law is applied to any or all parts of the parallel circuit—a toaster, a lamp, and a soldering iron are used as practical examples.

The third sequence lists the advantages of the parallel over the series circuit. If any part of the series circuit is removed, the circuit is opened and no current can flow. A second chief disadvantage is that the voltage is different across each resistor. Neither of these disadvantages is true of the parallel circuit; hence, it is possible to use equipment of a standard voltage.

The fourth and final sequence deals with the combination series-parallel circuits. Examples of the combination are the radio, the lamp-board, and the switch-board used for electrical controls.

**Committee Appraisal:** Excellent use of animation presents the flow of electrons along wires arranged in series and parallel circuits. The film should be useful in clarifying points not made clear by the lecture or laboratory demonstrations. The film is strong because of its unity of purpose. The only adverse criticism offered by the physics instructors was that insufficient time was devoted to showing the results on the meters and shifting from words in Ohm's law to symbols. Instructors teaching this unit to high school and college physics classes will find this film useful.

**Audio-Visual Education Conference  
Los Angeles City Schools, March 24**

THE first annual Audio-Visual Education Conference, sponsored by Dr. Vierling Kersey, Superintendent of the Los Angeles City Schools, and Mrs. Gertrude Rounsaville, President of the Board of Education of the City of Los Angeles, was held March 24, 1944, at the Audio-Visual Education Section. Approximately 175 conferees gathered for the General Session. Dr. Raymond E. Pollich, Assistant Superintendent of the Los Angeles City Schools, and General Chairman of the Conference, introduced Mrs. Rounsaville who in turn welcomed the group.

Superintendent Kersey presented many current teaching problems and the potentialities of the audio-visual program. He said in effect that the armed forces have taught us how to be successful in the war effort—that we can learn more, that we can learn it better, and that we can learn it faster, and that there need be no extraordinary cost in order to learn that way. Study has been made on why there has been this eminent success in getting more learning in shorter time with deeper meanings. It seems to center around the consolidation of the five factors of hearing, seeing, feeling, sensing and thinking. Are we ready to say to every teacher-training institution and to every teacher, that part of all teacher-training is the making of and the using of the best in audio-visual materials? The materials and their preparation and the knowledge of their meaning seem to be ahead of their use and the readiness to make increased use of them. Mr. Kersey closed with a challenge to all present to join in and pool ideas so that all could profit from the advances and conclusions of the others.

Following the General Session, five section meetings were simultaneously held in various rooms. The topics and the respective chairmen were as follows:

*How Teaching is Improved by the Use of Audio-Visual Tools*

Dr. Charles J. Falk, Assistant to the Superintendent, San Diego City Schools

*Basic Equipment Necessary for an Adequate Audio-Visual Program*

Dr. B. F. Enyeart, Superintendent, Burbank City Schools

*Standards in the Selection of Radio Program Material for Classroom Use*

Dr. W. K. Cobb, Superintendent of County Schools, Ventura

*Audio-Visual Materials for Today and Tomorrow*

Dr. Raymond E. Pollich, Assistant Superintendent, Los Angeles City Schools

*The Contribution of Sponsored and Commercial Materials to the Audio-Visual Program*

Mr. Bruce A. Findlay, Head Supervisor, Audio-Visual Education Section, Los Angeles City Schools

At the afternoon General Session the chairmen of the respective Section Meetings gave the conclusions and the pooling of ideas of their groups. Some of the conclusions were:

Teaching is improved if students and cadet teachers learn

**Sponsored Films to Get OWI Distribution**

Privately sponsored non-theatrical motion pictures will be accepted for distribution by the Office of War Information Bureau of Motion Pictures on condition that they deal with war information themes, contain no advertising, and are important enough to be distributed through the regular OWI channels. Such films will be reviewed and selected by the Bureau, which will also cooperate on new productions by furnishing suggestions and background material for films pertaining to the war effort which non-theatrical film producers can submit to their clients. Screen credit will be given to the sponsoring company.

This new policy has been adopted to provide the OWI Bureau with a regular supply of films, which it has failed to get since Congressional abolition of film production by the OWI, and curtailment of production by other Federal agencies. It is reported that negotiations for this private film material have begun.

**Psychological Cinema Register Taken Over By The Pennsylvania State College**

The Psychological Cinema Register, formerly operated by Dr. Adelbert Ford of Lehigh University, has been purchased by The Pennsylvania State College, Pennsylvania, and will be resumed immediately. Editorial supervision of the Register shall be carried on by the Department of Education and Psychology, of the Pennsylvania State College, thus endeavoring to preserve the high professional standards under which Dr. Ford accepted and distributed films in psychology, physiology, psychiatry, and related fields. Dr. Bruce V. Moore, Head of the Department of Education and Psychology has appointed Dr. Edward B. van Ormer, Associate Professor of Psychology, to serve as editor of the Register. Dr. van Ormer has been engaged for the past four years in informal experimentation with the use of motion pictures in the teaching of educational and child psychology.

The business management of the Register will be in charge of Mr. I. C. Boerlin, Supervisor of Audio-Visual Aids Service at Pennsylvania State College. Under his direction the College now maintains a library for the rental of educational films and other audio-visual aids, a projection service for both campus and extension classes, and a 16mm. sound motion picture production unit engaged in the making of educational films.

Dr. C. R. Carpenter, Associate Professor of Psychology, and now on leave as a Captain in the First Motion Picture Unit of the Army Air Forces, was instrumental in initiating negotiations for the acquisition of the Register by The Pennsylvania State College. Dr. Carpenter is also chairman of the American Psychological Association's Audio-Visual Aids Committee. His experience in the production of films, both before and during the War, will be of assistance to the Registrar, with which he will be affiliated in an advisory editor's capacity.

In taking over the distribution of these films, The

## Current Film News

■ **CASTLE FILMS**, 30 Rockefeller Plaza, New York, have compiled several new film chapters in the important historical record of World War II, covering:

**Fight for Rome and Russia's Smashing Offensive**—both in the same reel. The landing at Anzio and the battle for the beachhead is seen. The destruction of the Nazi fortress in the ancient St. Benedictine Monastery is a feature of the film followed by one of the terrific artillery duels on the Cassino line. In the second half of the film Russia's combat photographers provide thrilling glimpses of the Red Army in action, in the most recent fighting on the Russian front. Heavy shells strike so close to these cameramen the concussion shakes their cameras, making such scenes momentarily unsteady.

**Yanks Smash Truk** offers a complete picture report of our great naval assault and victory at Truk, the Jap "Pearl Harbor." Practically the entire film is aerial photography. Navy cameramen ride with the air armada to photograph planes and runways on the ground as they are blasted to destruction, Jap planes disintegrating in mid-air, and bombs scoring hits on Jap ships in the sheltered lagoon of Truk.

**Eruption of Vesuvius**—another new Castle release—covers the recent eruption which is said to have been the most violent and destructive outburst of the historic volcano in the past seventy years. It is a thrilling spectacle of gigantic forces of nature in action. A brief sequence on Pompeii is also included with something of the scientific story back of volcanic activity. Fiery rivers of lava

engulf whole towns and none of the efforts of the people to halt the flow has the slightest effect. The stricken people are forced to leave the doomed areas, but they always go back as the volcanic ash has fertilized the slopes of the mountain until the finest grapes can be grown there.

■ **Y.M.C.A. MOTION PICTURE BUREAU**, 347 Madison Ave., New York, has acquired the latest March of Time film on juvenile delinquency, called:

**Youth in Crisis**—2 reels—which depicts what is happening to our young

people because of the disruptions and excitement of war, the mental and nervous instability of some of our draft-rejected young men, and "teen-age" flouting of parental authority. The film points out that environment can do much to build character, but when the family fails, society must step in. Just how effectively intelligent communities are going about solving this problem, makes an interesting climax to this subject. Service charge, \$1.00.

■ **BELL & HOWELL Co.**, 1801 Larchmont Ave., Chicago, have added the following subjects to their Filmosound Library:

**Zamboanga**—8 reels—a dramatic and authentic tale of the Moro pearl fisher-

men. An all-Filipino production, sounded in Tagalog with English over-titles.

**The American Nile** (11 min.)—presenting some astounding relics of dead Mayan civilizations along the Usumacinta River, separating Mexico and Guatemala, the supposed descendants of which are now the most backward people on our Continent. Filmed by Count Byron de Prorok.

■ **BRITISH INFORMATION SERVICES**, 30 Rockefeller Plaza, New York, include two American-produced subjects, made by the Special Services Division of the U. S. War Department, in their latest list of new films, namely:

**Know Your Ally: Britain** (42 min.)—the first of a series describing the members of the United Nations. It tells of Britain's factories, rationing, part in Mutual Aid, drafting of men and women, life during Blitz, and role in the battles of this war.

**The Battle of Britain**—(53 min.)—authentic story of Britain during the tense period following the collapse of France, showing the first phase of Hitler's plan of attack in operation.

New British-made films are:

**Man Wounded** (18 min.)—how surgery and nursing have been brought up to the front line of the war; methods adopted to restore patients to good health again.

**Highland Doctor** (22 min.)—story of the famous Highlands and Islands Medical Service of Scotland; improved medical care of people in remote areas of Great Britain.

■ **WALTER O. GUTLOHN, INC.**, 25 W. 45th St., New York, announces that they have been authorized by the Bureau of Public Relations of the War Department to make available a selected list of U. S. Army pictures for showings to various groups including schools, churches, civic clubs, fraternal organizations, Chambers of Commerce, the American Legion, Veterans of Foreign Wars, and others. These films, which range from 6 minutes to 15 minutes running time, have hitherto been restricted to war plant showings.

The first releases represent a list of 16mm. sound motion pictures which contain many feet of actual combat taken by the daring, skillful cameramen of the Signal Corps, Army Air Corps, and other branches of the service.

Among the titles available are *War Department Report*, *Film Communique No. 2*, *Film Communique No. 3*, *Landing in Sicily*, *Bombers Over North Africa*, *Battle of Midway*, *Chunnel Fortifications*, *Army Service Forces*, and *Preclude to War*.

The Gutlohn organization has the contract to distribute the U. S. Army films in the following states only: New York, Maine, Virginia, Georgia, North Carolina, Louisiana, Kentucky, Connecticut, Vermont, West Virginia, Alabama, South Carolina, Mississippi.

Gutlohn has acquired the Hoffberg release, *Norway Replies*, in 16mm distribution from its New York headquarters and its branch libraries throughout the country. It is available for rental or sale.

■ **PICTORIAL FILMS, INC.**, R.K.O. Building, New York City, released this month the sixth film in the RKO series, *This Is America*, entitled:

**Medicine on Guard**—dealing with the important role played by physicians at home who protect the health of the men in the mines or on production lines. In Waverly, a war town, a strange malady breaks out. Science's new machines and Dr. Pritchard combat and destroy this enemy of the home front, thus making one further triumph for medicine on guard in America.

■ **HOFFBERG PRODUCTIONS, INC.**, 620 Ninth Ave., New York, are releasing 16mm and 35mm prints of an authentic documentary giving the first official story of Norway's great contribution to the fight against Fascism, under the title:

**Norway Replies**—6 reels produced under the supervision of the Royal Norwegian Information Service. Against the background of a dramatic narrative spoken by three of America's leading announcers—Ed Thorgeresen, Alois Havrilla and Ben Grauer—is told the saga of a brave country's continued battle against the Nazi invaders. Norway's merchant marine, the third largest in the world, has played an important role in making it possible for Allied troops to score repeated successes against the enemy. The full story of Norway's heroic role in World War II is told for the first time in a dramatic tale of a young Norwegian

### Audio-Visual Education Conference (Concluded from page 225)

to use audio-visual materials in Universities and State Colleges.

Administrators should become familiar with available materials and should continue to stimulate and to encourage teacher interest in this field by checking with teachers to see what uses can be made of available materials in the schools.

Lighter weight equipment must be developed. Also, new equipment will be such that it will not be necessary to darken rooms when showing films.

Physical handicaps—due to lack of budget set aside for audio-visual education purposes—impede progress of utilization of audio-visual programs. Teacher interest dies if participation in a program cannot be carried out because of lack of equipment or other inconveniences.

More pooling of audio-visual materials between school districts would be helpful. Teachers will not use materials when it is too difficult to get them.

Radio materials for classroom use must be consistent with the curricular purposes of the school and of the classroom; must be authentic in content, and should have something more to offer than the classroom teacher can offer. The program should be clear and comprehensive to listening students, and should stimulate correct English usage. Transcriptions may serve the purpose better than direct radio programs, as the transcription is made in special studios and is more accurate.

It would be helpful for all teachers if a clearing house were set up where administrators, teacher groups, and researchers could pool their findings for the benefit of all.

Institutes are helpful in making teachers conscious of the use and advantages of audio-visual materials. Unless the audio-visual program has the support of the school administrators, nothing much can be done to further the cause of audio-visual education as rapidly as it should be.

There is no particular rule of thumb which can be used with any success so far as sponsored materials are concerned. Textbooks carry acknowledgment of all persons who help to write the book, and the books are accepted if the content is good despite these acknowledgments. Why shouldn't our films carry names, too, if it is done in propriety. The school journey to private concerns is universally accepted; why not the sponsored materials?

Organizations manufacturing audio-visual materials should avail themselves of the knowledge of educators connected with the particular field for which they are making slides, films, or audio-visual materials.

Miss Elizabeth Sands, Assistant Superintendent of the Los Angeles City Schools, led the panel discussion "Administering an Audio-Visual Program in the Elementary, Junior High, and High Schools." Many worthwhile points were brought out at this panel. It was concluded that among the things needed in most schools are: wider acquaintance with available resources; increased awareness on part of teachers of the value of audio-visual materials and willingness and ability to use them; increased facilities; space for proper storing of materials; proper organization and management of the program, and careful planning.

A "snack preview," presenting the highlights of various types of audio-visual materials followed the panel. The preview was concluded by the showing of a picture, "Education a la Carte," which was directed, photographed, and narrated by members of the Audio-Visual Education Section of the Los Angeles City Schools. The picture deals with the Agricultural Mobile Unit of the Vocational Section which "brings the country to the boy."

(Concluded from page 228)

who escapes from his captive homeland to England, where he wins his wings and returns with a bomber squadron to wreak vengeance on the Nazis.

■ **THE JAM HANDY ORGANIZATION**, 2900 E. Grand Boulevard, Detroit, last year produced for the Allis-Chalmers Mfg. Co., Milwaukee, Wisconsin, the first of a series of educational sound motion pictures on the construction and operation of the modern steam turbine. Production has now been completed on the second picture in this Magic of Steam series,

**Inside a Surface Condenser**—18 min. running time. This subject, like its predecessor, is available for free loan to any institution, industry or other group interested. Each complements and supplements the other, though each is complete in itself. In both films technical animation has been freely used to delineate parts and functions of the modern turbine power plant, supplemented with motion photo-

Simple power cycle showing how the condenser fits into a power plant, and how it increases efficiency.

Animated sequence shows the condenser chamber and steam condensing on the tube surfaces.

graphy. The condenser film, for instance, establishes the principle of condensation by means of simple closeup laboratory experiments showing that warm vapor plus cool surface equals condensation. There are many animation sequences with cutaway housing showing the condenser performing its functions. Both films have been designed as aids to the instruction of students in the basic principles of this efficient type of power plant.

For details regarding the free loan of 16mm prints of either or both subjects write the Public Relations Department, Allis-Chalmers Mfg. Co., Milwaukee, Wis.

■ **OFFICE OF WAR INFORMATION**, Bureau of Motion Pictures, Washington, D. C., is aiding in the WAC Recruiting Drive by depositing with its distributors 16mm prints of a new film made by the Signal Corps, War Department, titled:

**It's Your War Too**—1 reel—showing how effectively the WACs are serving along side of men in a wide variety of fields both here and overseas. It calls attention to the tremendous possibilities the service offers for personal and professional advancement. General Marshall pays tribute to the WACs and points to the acute need for more women to join the ranks now.

Another subject made available this month through the courtesy of the Office of Price Administration, is called:

**Prices Unlimited**—1 reel—a powerful presentation of what would happen to prices in this country if we did not have rationing.

been made available by Gutlohn are *Pardon Us*, *Sons of the Desert*, and *Beau Hunks*.

**Get Hep to Love** (RKO)—featuring Gloria Jean and Donald O'Connor. The story centers around the adventures of a youthful concert star who wearies of it all and runs away.

■ **COMMONWEALTH PICTURES CORPORATION**, 729 Seventh Avenue, New York (19) report the following two Walter Wanger feature releases in 16mm sound:

**Slightly Honorable**—9 reels—described as a sophisticated and amusing story, coupled with a mystery plot. Pat O'Brien is the star.

**Eternally Yours**—11 reels—a gay comedy of romantic complications. Scenes of entertaining feats of magic are performed by the hero, "The Great Arturo," played by David Niven. Co-starring is Loretta Young.

Commonwealth controls exclusive worldwide distribution rights to these productions. In Chicago they are offered for rental through Ideal Pictures Corporation.

### DeVry Contest Awards

War Bond Awards in DeVry Corporation's 1944 Motion Picture Camera & Projector Design Competition, have been announced. Winners include several members of the armed forces, three Canadians, and an occupational variety typical of the universality of the growing interest in motion pictures as a hobby.

"Details of the prize winning designs and mechanical suggestions," explains DeVry President William C. DeVry, "must await V-Day and the resumption of civilian motion picture camera and projector manufacture. It can be said, however, that the designs, ideas and suggestions submitted indicate keen interest in and definite opinions regarding post-war's motion picture equipment, particularly in the amateur field."

To George J. Heim, of 3330 North 11th Street, Milwaukee, Wisconsin, went first prize for the best motion picture camera design. To Frederick Arthur Amster, of 3515 Bunker Hill Rd., Mt. Rainier, Md., went first prize for the top projector design. Heim is a machinist; Amster a motion picture animator.

For camera design, Douglas G. Sites, of Havre de Grace, Md., a civilian gunner at the Aberdeen Proving Grounds, won second prize. To Robert C. Denny, 750 Vassar Avenue, Fresno, California, an electrical operating engineer, went third prize. Second prize for projector design went to Jewell (Bud) J. Mulkey, of 1116 Third Street, Fairbury, Nebraska, a radio service man. Third prize for projector design went to Private Irving Krauss, whose home address is 1312 Sheridan Avenue, New York, N. Y., but whose present whereabouts is a military secret. Ten additional awards were made for camera mechanical refinement suggestions and an equal number for projector mechanical refinement suggestions.

### Entertainment Releases in 16mm

■ **WALTER O. GUTLOHN, INC.**, 25 W. 45th St., New York, have released:

**Here We Go Again** (Universal)—a farce comedy with all-star cast that includes Fibber McGee and Molly, Edgar Bergen and Charlie McCarthy, Ginny Simms, Ray Noble and his orchestra.

**Pack Up Your Troubles**—a Hal Roach comedy with Laurel and Hardy cast as misfit privates who bungle their way through the Army in a hilarious manner. Other feature length comedies, starring these two comedians, which have

## Additional Valuable Literature —

### “1000 AND ONE”—The Blue Book of Films

“1000 and ONE” The Blue Book of Non-Theatrical Films, published annually is famous in the field of visual instruction as the standard film reference, indispensable to film users in the educational field. The **CURRENT, NINETEENTH EDITION** lists and describes over 5,000 films, classified into 176 different subject groups (including large groups of entertainment subjects). A valuable feature is a complete alphabetical list of every film title in the directory. Other information includes designation of whether a film is available in 16mm, or 35mm, silent or sound, number of reels and sources distributing the films, with range of prices charged.

136 pp. Paper. Price 75c. (25c to E. S. Subscribers)

### FILM EVALUATION SUPPLEMENTS TO “1000 and ONE” under The National Film Evaluation Project

A new and unique service to the teaching field. Film Evaluations made by nation-wide Judging Committee of over 500 teachers after actual use of the films with classes.

Each Supplement consists of 50 standard-size library cards carrying detailed evaluations of 50 films, based on combined scores of 15 or more teachers on each film. Three Supplements have appeared to date. Another appears as soon as 50 more films attain their quota of 15 or more scores.

Price per Supplement—50 cards in carton, serially numbered 1 to 50, 51 to 100, 101 to 150, etc., with full explanations accompanying, 50 cents (postpaid if cash with order.)

### THE AUDIO-VISUAL HANDBOOK (4th Edition) By Ellsworth C. Dent

Presents in convenient form, practical information for those interested in applying visual and audio-visual aids to instruction. The six chapters include discussions on “The Status of Visual Instruction,” “Types of Visual Aids and Their Use,” “Types of Audio-Visual Aids to Instruction,” “Types of Sound Aids for Schools,” “Organizing the Audio-Visual Service,” “Source List of Materials and Equipment.”

212 pp. Illus. Cloth. Price \$1.75

### AUDIO-VISUAL AIDS TO INSTRUCTION By Harry C McKown and Alvin B. Roberts

A practical volume which shows the teacher and administrator how to select, organize, and utilize audio-visual aids of all types, in all subjects, and at all levels, from kindergarten through the twelfth grade. Primary emphasis is on actual practice and every effort has been made to include specific information and advice which will be most helpful in the classroom.

384pp. Cloth. Illus. Price \$3.00

### PICTURE VALUES IN EDUCATION By Joseph J. Weber, Ph. D.

Presents in unusually interesting form the results of the extended investigations on the teaching values of the lantern slide and stereograph.

156 pp. Cloth. Illus. Price \$1.00 (67c to E. S. subscribers)

### AN ALTERNATIVE FOR REVOLUTION AND WAR By Albert E. Osborne.

A stimulating, wide-range view of the higher potentialities of visual instruction in promoting world harmony by a “more humanity-centered education.” A pertinent reply to H. G. Wells’s dictum that the “future is a race between education and catastrophe.”

124 pp. Cloth. Price \$1.25.

### EVALUATION OF STILL PICTURES FOR INSTRUCTIONAL USE. By Lelia Trolinger

A full presentation of the latest piece of research on determination of teaching values of pictures. Development of the Score Card and elaborate experiment in use of same. Full documentation, tabulation of results, and appendices. The latest, most complete and scholarly investigation of a problem in the visual teaching field that has long needed such a solution.

48 pp. Paper. Illus. Price 50c.

### PRODUCING SCHOOL MOVIES By Eleanor Child and Hardy R. Finch

Based on first-hand experiences of the authors and those of many other teachers and movie enthusiasts. Chapters are “Organization (of a Club); Choosing the Idea; The Scenario; Buying Equipment; Using the Equipment; Filming the Picture; Advanced Techniques; Final Preparation and Showing. A welcome book to those who want movie-making explained in simple terms.

151 pp. Paper. Illus. Price \$1.50.

### SELECTED FILMS FOR AMERICAN HISTORY AND PROBLEMS. By William H. Hartley

Part I gives directions for obtaining, evaluating and utilizing films. Part II comprises a fully annotated catalog of the most useful films for illustrating various aspects of American Civilization. Title of film, length, whether sound or silent, production date, producer, sale and rental price and grade level suitability, are given. Also synopsis of film content. Suggestions are offered concerning most effective application of the film to the teaching situation.

275 pp. Cloth. Price \$2.25.

### THE USE OF VISUAL AIDS IN TEACHING By Ella Callista Clark, Ph. D.

Brief, clear, concise, authoritative. An attractively printed manual of procedure for all visual aids in teaching, with stimulating suggestions for the inexperienced teachers as well as for the veteran.

24 pp. Paper. Illus. Price 25c.

### HOW TO MAKE HAND-MADE LANTERN SLIDES By G. E. Hamilton

24 pp. Paper. Price 10c.

### THE STEREOGRAPH and LANTERN SLIDE IN EDUCATION. By G. E. Hamilton.

The most comprehensive discussion yet published.

47 pp. Paper. Price 15c.

## Clouds . . . *made to order*

Contributing realism to flight conditions simulated by the Link Celestial Navigation Trainer is the job of a Spencer Delineascope.

By means of a celestial dome above and a silk projection screen below the "bomber," the trainer enables the crew to rehearse complete navigation problems, "flying" on instruments as realistically as if they were thousands of feet above the earth.

While the trainer "flies" on its "mission," cloud effects are projected by the Delineascope to cut off temporarily

from time to time the pilot's and navigator's view of the earth below.

Spencer Delineascopes also serve in many other wartime capacities.

**A JOB WELL DONE . . .  
BUT NOT YET FINISHED**

America's school children have been the very backbone of our scrap drives. Organized and directed by able and enthusiastic teachers, these drives have unearthed invaluable rubber, metal and paper for vital war use. Before summer vacation, set your class on the hunt for more scrap. Urge them to continue their fine work thru the summer. The need is ever-present.

Scene from *Zamboanga*, in the Philippines, one of the many excellent geographical films from Filmosound Library. These are more than mere "travel" films. They are concerned with people, customs, the *social* aspects . . . as well as with the purely geographic. Thus, geography—on films—is made dramatic, unforgettable.

**FILMOSOUND FOR TOMORROW**

Different not only in appearance, but in performance, too, the Filmosound of tomorrow will embody basic refinements to set wholly new standards for your future classroom projection. Thousands of today's Filmosound Projectors are in daily use by our armed forces all over the world.

**FILMOSOUND LIBRARY ENRICHES CLASSROOM HOURS**

There are literally thousands of excellent motion pictures ready for your use in the Filmosound Library. They include films on almost any phase of school work. They're all listed in the *Filmosound Library Catalog*, and, in the *Educational Utilization Digest*, you'll find each film evaluated for its application to specific school subjects and for its suitability to various school age groups. The coupon will bring both publications promptly.

An unusual innovation in teaching methods

**THE NEW KEYSTONE**

*Overhead Projector*

- A short-focus lens brings the instructor, the projector and the slide together at the front of the room.
- The slide is visible on the slide table before the teacher, which enables her to discuss its content while facing the class. When one slide is pushed over the projection opening, it pushes the previous slide off.
- The teacher can write or draw on the etched glass placed on the slide table and the development of the lines of writing or drawing is reproduced on the screen.
- Ideal for the use of the Flashmeter, as it makes feasible, through the use of a slotted screen device, the showing of individual words, phrases, or sentences from a slide consisting of several lines.
- The lamp house is air-cooled by a motor-driven fan, which prolongs the life of the lamp and prevents the breaking of condensing lenses and slides.

# The New **RADIANT** **FOLD-PAK**

*A Large Size Durable Screen that folds  
Into a Light Weight Compact Portable Unit*

*Adaptable to Any  
Type of Installation*

Between buildings.

On Outside walls.

Suspended from tree.

Outside of truck.

Between Poles.

Suspended from Line.

*Fits into flat  
compact case  
that is easy to  
carry.*

Now—with this new Radiant Fold-Pak—it is possible to have a large screen ranging from 7' x 9' to 11' x 14' which folds into a light, compact, convenient carrying case. Made from a newly developed material with a pure white surface. Fold-Pak Screens will not crack, peel, or discolor, can be easily washed or cleaned—and will give long satisfactory service. Provided with sturdy metal grommets in a strong reinforced webbing on all 4 edges. Enables user to quickly string up anywhere. Can be used under any climatic conditions—rain, snow, extreme heat, or cold. Ideal for indoor or outdoor shows or classes, conventions, sales meetings, camps, institutions, outings, and political meetings. Opened screen provides a flat unwrinkled surface for best projection.

## Events and Achievements

CALIFORNIA is the latest State to establish a Division of Audio-Visual Education in the State Department of Education. The resolution adopted by the State Board of Education states that the purpose of this division will be to aid in the proper development and use of audio-visual educational materials in the public school system in such manner and to the extent determined by the director of education.

■ The "first animated educational training film in technicolor" has been produced by Walt Disney, sponsored by the Electric Auto-Lite Company for the automotive field. "The Right Spark Plug in the Right Place" (2 reels) will be available to the Armed Forces first, then to the general field. Spanish and French versions are also planned. Advertising element negligible.

■ A regular radio broadcast, aimed specifically at stimulating the general public to greater interest in visual education, is on the air. Station KOY in Phoenix, Arizona, is offering a series of programs on "Trends in Visual Education". And why not radio promotion of schools, for a change, as well as of factories?

■ It is interesting and impressive to know that "between 7 and 8 million trainees in the armed forces have seen the vocational training films developed by the U. S. Office of Education" within two years! Many are leaping to the conclusion that this proves that pictures spell the doom of books. Then it is announced that the Navy alone, within one year, buys "more than 8 million books for its personnel in all parts of the world." It is not a matter of pictures or books, but pictures and books. Books, of course, are the most nearly immortal of man's creations. Anything else—granite, steel, celluloid—is ephemeral beside them.

■ The "Adventures of Mark Twain" seems to have touched off a whole series of biographical movies, on the familiar formula of "when a picture pays make some more like it." Of the nine announced, two of the most significant are to concern the lives of Will Rogers and John James Audubon. British Production is doing a similar job with "The Life of Field Marshall Smuts."

■ Ten years ago weekly attendance at film theatres in England was estimated at 24,000,000, which was considered "an unsurpassable top", according to the British Board of Trade. Weekly attendance is now some 30,000,000. Possibly the million or so well-paid American soldiers in England helped to surpass the unsurpassable. The announcement also states that less than

21% of the total showings were British-made films.

■ New York City High Schools now offer a one-year course in Radio—radio-writing, production, speech, engineering, sound recording, and broadcast station operation—with the double purpose of training future teachers in the use of radio in classroom instruction and also to offer a new vocational field for the students deciding upon their life work. Details have been worked out between the New York Board of Education and James Rowland Angell, former President of Yale University and present Public Service Counselor with NBC.

■ The United Nations Central Training Film Committee, in Washington, has collected over 5000 films produced by the Allied Nations, all aimed at (1) teaching a skill, (2) imparting information, (3) developing an attitude. The best of these are said to surpass in quality the best civilian-produced teaching films.

■ Chicago's Museum of Science and Industry operates the only extant and successful Nickelodeon. The bright spot of "Yesterday's Main Street" is the flicker theatre showing old time thrillers, with piano accompanist, four shows an hour, at a nickel a head. A Keystone Cop keeps the crowds in line, 1800 per Sunday. "Decidedly self-supporting," says the Museum.

The Museum is also planning a film industry exhibit, already endorsed by the Chicago Films Council. Further endorsements are being sought from the Illinois Women's Clubs and the Hays Organization.

■ Last month Mohandas K. Gandhi saw his first sound motion pictures! They were "Mission to Moscow" and "Mickey Mouse". M-m-mmm!

## Plans and Predictions

MUCH is brewing in many quarters over a postwar 16mm. camera, "the sub-standard miniature", supposed to sweep the country as did the 35mm. miniature camera in the 1930's. Plans include new Kodachrome film to fit, single or double frame size, which can be processed by the amateur himself and reproduced in color-paper prints, if desired. At least five firms are said to be busy on such a camera, with Ansco building a large new factory for color film and printing paper.

■ No telling how or when the press and the radio will unite as a "communications industry", but the question is very much under consideration. It was an important topic at the past annual convention of American Newspaper Publishers in New York City, namely, "radio as an inevitable adjunct to publishing".

■ In England nearly half the motion picture theatres in many population centers have been utterly destroyed. The British are planning marked changes in the postwar reconstruction. Sites will be only partially rebuilt as theatres, the balance used for parks, playgrounds, and community rooms. The cinema-to-be is conceived as a definite adjunct to school and community education, a center for communal activities for neighborhood betterment and mutual understandings.

■ The photo industry teems with postwar plans for civilian production of new items developed for Army and Navy use during the war. This will mean more men needed for the work and the industry plans to open these jobs to ex-service men who were attached to the photographic arm of the services. All are invited to apply. Application blanks are ready. Consult any of the photographic magazines for firm names and addresses.

■ Hollywood, seemingly bent on solving social problems at a profit, announces "juvenile delinquency pictures in quantity" for theatrical showings as exhibitors see fit, such as "Delinquent Daughters", "Are These Our Parents?", "Look to Your Children". One producer plans two, to sell "for exhibition as a double bill", entitled "Our Wandering Daughters" and "What Price Innocence". It is planned to get the cooperation of "religious organizations, P. T. A. groups, women's clubs, as well as governmental authorities." Might be, for the schools of Gettysburg, Pa. are reported to have opened their bulletin boards to posters inviting attendance on the first picture, "Where Are Your Children?". Still, the Legion of Decency has just condemned another of the series, "Delinquent Fathers". Report on the first picture says it is "making money", no report as yet on what it solves.

In two cities youth is out to eradicate its own juvenile delinquency. Kansas City has a group of 400 "Junior Officers", organized from grade and high school pupils, serving as cops within the theatres. Exhibitors have complained that youth sometimes tears up theatre furnishings and throws things. And Chicago has 250 selected delegates, forming the "Youth Conference", with two-fold duties of policing the theatres and censoring pictures for youthful consumption.

*Thus Hollywood and Youth are busy on the problem. Would it be possible, by any chance, for parents and educators to have a share also in this important work? Certainly some use could be found for them.*

# More Power for You

## Another Amprosound Model for Larger Audiences

There is an Ampro 16 mm. projector for every need—from living room to huge auditorium. Here is Model UA for instance, compact, portable, thoroughly tested in the educational field, with sufficient output to provide adequate volume for audiences up to 2500. Has many additional features including triple octon tone control that permits complete mixing of sound from film, phonograph and microphone.

When Ampro resumes production for civilian users—Model UA, or its equivalent, will again be ready to deliver more power for you! Write for latest Ampro catalog of 8 mm. silent and 16 mm. silent and sound projectors.

*War Bonds*

# AMPRO

Enclosed projection booth with equipment, in the special visual education room. Girls, as well as boys, are taught to operate the projectors.

## Motion Pictures in a Modern High School\*

OUR governmental agencies and armed forces are giving proof, beyond any hitherto given, of the effectiveness of motion pictures. It is imperative that progressive educators encourage a more extensive use of this medium in their schools and urge boards of education to set aside a budget to finance the wider program.

Analysis of motion pictures as used in John Hay High School shows that this educational tool performs a triple role: (1) the recreational-educational programs, (2) the public relations and vocational guidance programs and, (3) the classroom visual and auditory programs. For convenience, each of these will be elaborated upon separately.

### The Recreational-Educational Programs

The Recreational-Educational programs, the "Assembly Program" and the "Noon Movie Program," take place in the school auditorium. The assembly programs are periodic in nature and are furnished free to the entire student body. Their purpose may be cultural, informative or educational. A typical example is a film accompanied by a lecturer. He may be naturalist, traveler or an outstanding authority in a field of general interest to the entire school. Or the assembly program may consist of a sound film. The subject may be introduced by the principal or a faculty member and the film may be of the morale-building or documentary type whose main purpose is the dissemination of information of what the War is about and ways and means by which the students may best expend their energies to promote the war effort.

The second type of auditorium program is the noon movie, the daily showing of selected motion pictures in

Detailed account of operational method and wide-range use of films as achieved in a single school.

**LIBRADOR K. MEOLA**

Director of Visual-Sensory Aids

John Hay High School, Cleveland, Ohio

the school auditorium during the luncheon periods for a small admission fee, attendance upon which is entirely voluntary. It consists of a 20-minute showing of a feature picture or program of shorts. Of a feature picture two reels are shown daily. When the feature is completed, the balance of the week is devoted to pictures like the March of Time, or travelogs.

Obviously, the selection of the noon movie must meet certain definite criteria in order to justify its use. If properly selected, the film (1) should help solve some life situation, thereby increasing the educational horizon of its audience, (2) must have sufficient appeal to make students want to go to see it of their own free will, (3) should deal with both desirable and undesirable life situations, the solution of which will leave its audience with desirable impressions, (4) should have technique and content both authentic and reliable, (5) must induce attitudes that are both appreciative and discriminatory, (6) should create critical attitudes and good judgments, (7) must be wholesome and provide an enjoyable and truthful presentation of literary, historical, political, and economic experiences, (8) should inspire youth to read the books upon which the film has been based, (9) and finally the noon day film should be a laboratory for motion picture appreciation courses, where criteria are set up for shopping intelligently for one's recreational needs outside the school.

So much for the selection of noon movies at John Hay. Apparent advantages are derived by the school. Such a program (1) does away with the costly and

\*Talk given at Visual Aids Conference, Cleveland, Apr. 1944.

difficult job of supervising large study hall groups (approximately 800 students each). (2) is a sort of school safety valve, in that it provides a program where students can give vent to pent up energies, thereby minimizing discipline problems, (3) simplifies the school's master program, in that several teachers who would have been assigned to study halls may be doing classroom work, (4) provides a source of income for carrying out an extensive visual-sensory program throughout the school, (5) and offers the school a splendid opportunity to correlate and integrate with the courses of study many of the better Hollywood historical and documentary motion pictures, making the program a worthwhile educational tool for the teaching of social, political, and economic problems.

Surely no one can minimize the part played by historical pictures such as "Tennessee Johnson" and "Young Mr. Pitt," in the social sciences; actors such as Colman, Massey, Garson, and others, for English classes in speech and drama; musical performances for classes; interpretation of pageantry and color in art; clothes, hair styles, costuming and designing in home economics; scientific developments in science classes; technical discussions in photography; and the morale-building and good-citizenship lessons found in many features and shorts which go to enrich our extra-curricular program.

#### Public Relations and Vocational Guidance Program

Need for a school public relations and vocational guidance program has long been apparent. Though there are several avenues of approach, perhaps the outstanding one is an up-to-date school film in which the many worthwhile school activities are effectively portrayed. Let me show how our school film, which requires 32 minutes to show and has a recorded lecture for explanation, has been utilized. It is our public relations vehicle. It may be used as a main feature at P. T. A. meetings, church and public gatherings, and has even taken the place of a speaker at commencement. Its value is apparent when used to acquaint various civic groups with the activities of our particular type of school, and justifies to the taxpayer the use made of the hundreds of thousands of dollars spent for equipment. In fact, these showings contribute much to the cause of education by selling future educational programs and enlisting financial support therefor. Parents of prospective students, too, are shown the courses of study and skill possibilities of the school. The film portrays the complexities of a modern school curriculum that has

Lionel Barrymore and Van Heflin as Thaddeus Stevens and Andrew Johnson. (From the MGM film "Tennessee Johnson.")

evolved from the little red school house to a modern plant. Furthermore, the school film has brought parent, child, and teacher onto a common ground where educational problems can be discussed intelligently; it makes possible an entire review of the school program in the pictorial language where vocabulary and language differences are reduced to a minimum.

Secondly, the school film finds important use by vocational guidance directors. In a large city, Junior High School students must make their first big decision in life when they select the high school they wish to attend. A school film gives these Junior High School students first hand information. Since John Hay is a commercial school, it is our aim to attract Junior High School students who do not plan to continue to college but must aim at either technical or commercial training. The school film reveals more vividly than words the skills of these specialized vocational schools. Students who are movie-minded, recognize the types of skills which they desire to learn and thus can make an intelligent choice of both their school and life work.

Finally, the film serves our own vocational guidance

William Pitt, prime minister of Great Britain (played by Robert Donat) addresses the House.

(From the Gaumont-British film, "The Young Mr. Pitt," released by Twentieth Century Fox.)

program by helping our 10 A students in the selection of their specializing courses. This program sets aside meetings within the first seven weeks of the semester, at which all 10A students see vocational films and demonstrations of each course of study. They make excursions to the special laboratories and work rooms where they see classes at work. Then, the school film is shown, followed by a discussion to clarify questions. Students thus gain a clear picture of the five vocational courses offered and the electives necessary to meet requirements for graduation.

### **The Visual-Auditory Program**

Since the classroom or instructional film subjects shown each semester in John Hay are numbered by the hundreds, we have found it necessary to show films in several departments simultaneously each day. This is made possible because we have not only a special visual education room equipped for projection but at least one class room with darkening shades in each department. As a result, it is not uncommon for 2000 students to see visual programs in one day. Many of the programs are repeated from 9 to 13 times and as many as 40 different classes benefit by them.

The Social Science and Natural Science departments participate in the classroom visual program oftener than other departments because there are more films in these two fields. Classes in Economic Geography are benefited weekly by the many films on geographical areas, and map studies, the products of each area, and the interdependence of nations. In Consumer Economics, films are shown on alternate weeks dealing with governmental agencies, foods, insurance, and money and management; American History classes have weekly films dealing with discovery, settlement, wars, our country's leaders, the development of our government and our growth. Classes in Civics see, each week, films that portray the functions of our national government, the work of various governmental agencies, and the many films produced by the Office of War Information, Office of Price Administration, Social Security, as well as the March of Time and kindred films. The classes in Economics use films dealing with backward civilization, farming, industrial processes, money and exchange, banks, and documentary films which deal with industry, labor, farm management conservation, salvage, the war effort. Home Economics classes use films on nutrition, foods preservation and cookery, textiles, budgets, etiquette, personal regimen, pottery, dress, and furniture. In Social Problems we have twelve programs of films dealing with conservation, city planning, slum clearances, sociological problems, governmental developments, city improvements, transportation and communication and agriculture.

Natural Science classes, in first and second semester physics, follow a prescribed course of study with suggested films weekly, on pressure, simple machines, water, aviation, electricity, light, heat, sound, and biographical films on leading scientists. Biology, beginning and advanced, utilizes film materials on plant, animal and human life, each grade having one film program per week and quite frequently two. Automobile Driving classes have a weekly film program on various parts of the combustion engine, spark plug, lubrication, petro-

leum, etc. In Senior Science I and II, we have weekly films dealing with all phases of household needs, scientific development, building, etc. The photography classes make occasional use of certain films for shadow effects, color, and other photographic techniques.

Classes in Art use films on pottery, poster making, carving, etching, buildings, and cathedrals, and many other subjects. Color cartoons, scenic shots and moving animals find a welcome in these art classes. Classes in Physical Education utilize several of the war information films on first aid, life saving, physical developments, and certain indoctrination films which portray our enemy and his ways. Classes in English make very limited use of motion pictures because (1) all classes listen weekly to special radio lessons which are broadcast over our school station and (2) because suitable feature films are too long to show in a class period and time does not permit showings after school. Plans are, however, being formulated whereby some experimental work will be done with films as an aid in encouraging essay writing and vocabulary building.

Some use of motion pictures is made by the Commercial Department. A limited number of films are adaptable to courses in typewriting, stenography, bookkeeping, office machines, business information and mathematics. Some programs are arranged for this department by using films on telephone techniques, general office practices, vocational guidance and commercial films produced by individual office machine manufacturers. In order to meet the need for a visual aid in typewriting, we have produced our own film on typewriting techniques, especially for beginners, and it is being rented by many schools in various parts of the United States. Our Retail Store Course uses films on manufacturing processes, merchandising, advertising, selling procedures and store management.

### **Facilities and Equipment**

This intensive use of films in our classroom is made possible by our extensive facilities. Portable projection equipment for use in classrooms comprises four 16mm projectors, two sound and two silent. Eleven classrooms and a special visual education room are provided for visual programs.

The visual education room at John Hay, which is unique in Cleveland Schools, merits further description. This room, 25 by 70 feet, seats about 200 students, is acoustically treated, has a sloping floor for unobstructed vision and an enclosed projection booth in which all machines are placed. The films are projected on an 8 x 10 screen. Here too is a small stage equipped with a large demonstration table where teachers may follow up the visual program with displays, charts, experiments or around which a panel discussion may be carried on. In the projection booth in the rear are permanently installed at their respective port holes a 16mm arc and a 35mm arc projector. A third port hole may be used for a slide machine. The amplifier in the booth is used for sound on film, playback unit, and microphone, outlets for which are either in the front of the room or in the booth. This room because of its size is used especially for programs where two or more classes meet the same period, for guidance programs and special visual programs.

# Canadian Movies Promote Citizenship\*

**DONALD BUCHANAN**  
National Film Board of Canada

How Canada uses films for effective community education on a nation-wide scale. A notable development.

**C**ANADA is a nation dominated by geography. It is almost a truism to state that the immense distances and the scattered locations of our provinces make an integrated citizenship difficult to achieve. The motion picture, used as a vehicle for citizenship, however, can do much to promote national understanding. In fact, as far as Canadian farm families are concerned, the war has brought few developments which touch them closer in their social life than do the travelling theatres of the National Film Board. This project now serves, each month, an average audience of four hundred thousand rural folk. Thus, a new kind of "Movie Night" has sprung into being in hundreds of Canadian villages and country crossroads. These audiences not only see films about the war and its relation to democracy, but they also watch pictures about farm production and the life and industry of every section of the Dominion. National unity comes alive, takes form and substance on the screen.

The history of this undertaking goes back to December, 1941. On that date, John Grierson, the Dominion Film Commissioner, and Herbert Lash, who was then Director of Public Information, decided that the talking picture, with its combined appeal of voice and visual image, was the best medium for carrying the message of fighting Canada to all those communities of varied racial origin which make up rural Canada, from east to west. They lost no time in putting their thoughts into action. Willing helpers were found among those many Canadians who, for years, had wanted to use the motion picture as an instrument of civic instruction;

some were on the staffs of our universities, others were connected with the provincial departments of education. By telephone, some half-dozen of these enthusiasts were immediately appointed as regional agents for the project, and by telephone, too, they were given instructions as to what type of projectionist to hire, and in general how to conduct organization in the field. So, in less than a month, thirty mobile units were on the road. To-day, a little more than two years later, there are seventy of these travelling theatres across Canada, in every province from Nova Scotia to British Columbia.

Each farming or fishing village is visited regularly once a month—on a specific day well known in advance to all local residents. Local committees do

all the arranging for halls and publicity. Although projectionists usually travel by automobile, sometimes they go by train, and, in the depth of winter, when highways are blocked, they have to hire sleighs. With few exceptions, they always manage, despite sleet and blizzard, to present their shows on time; indeed, it would not surprise the officials of the Film Board if, this winter, they heard that some of the projectionists were demanding allowances for frozen fish to feed their husky dogs!

Throughout, there has never been any question of competition with commercial theatres. The circuits are restricted to villages where motion pictures are not normally shown. Round Lake St. John in Northern Quebec, whole parishes reported that these were the first talking movies they had ever attended. And that is not all. In certain Mennonite and Ukrainian districts of the Prairies, the old folk and youngsters, too, claimed they had never seen movies of any kind before. In one place in Saskatchewan, an aged Mennonite turned up and sat excitedly with his eyes facing the projector! It had to be explained to him that he would see the pictures best by turning round and watching the screen, not the machine.

How are the programmes composed? There has to be a new group of films each month. They have to be made up to appeal to every race and section of the nation; for example, *Trois Pistoles*, Quebec, views the same subjects as does *Salmon Arm*, British Columbia. The war subjects are not restricted in origin by any means; they are produced in London, Sydney, and Washington, as well as in Ottawa. Pictures, edited in Canada, about the Chinese and Russians are also included, and there was even a Brazilian offering recently. Other shorter films deal with specific problems of agriculture, while some are designed to appeal to the housewife. There are hints about conservation of clothing, and explanations of rationing and of food values.

Usually the screenings last eighty minutes. The films are of 16mm. size, offering about a quarter of the negative area of the standard 35mm. films used in commercial theatres, but modern portable projection equipment allows them to be shown with suitable quality of presentation in even relatively tiny halls.

Special newsreels about Canadian resources and the war are made up each month. Two scenes of spruce logging in British Columbia, and one from the film "Ottawa on the River."

On the day the projectionist arrives in a typical community, he goes first to the local school where an afternoon showing is held for students. Then, in the evening, a screen is put up in the community hall or church basement. The shows are free, although sometimes silver collections are taken for the Red Cross or for other patriotic funds. Much of the success of the performances can be credited to energetic farm women, who plan social hours and suppers after the screenings.

More and more these travelling theatres, with their emphasis on citizenship, are becoming the focus of village life. For example, in Manitoba, through expert assistance provided by the rural extension service of the provincial university, "Film Forums" have been started. An assembly of this nature is made up as follows: for an opening, a sing-song film; then motion pictures of Canada and the United Nations; afterwards a question period led by the local chairman. Sometimes these discussions are replete with suggestions for action. One projectionist, Peter Brown, reporting from the Gretna area of Manitoba, states: "Interesting ideas for post-war reconstruction are now and again expressed at these Film Forums with practical details such as: the provision of water and sewage systems in the smaller towns; the establishment of more technical schools; the erection of more public libraries; and rural electrification after the war".

One interesting sidelight concerns the school and the community. Through teaching projects related to these showings, the adults of many communities have for the first time become thoroughly conscious of the topical scope of many classroom activities today. For example, in the Okanagan district of British Columbia, the best essays written about these citizenship films by local pupils—exciting compositions on "A Heritage We Guard", "Inside Fighting Russia", and "Women are Warriors"—have been printed by the editors of the local weekly newspapers.

In each province, the school showings are directed toward citizenship aims. Children are encouraged to prepare descriptive compositions, and the teachers or projectionists often arrange to give small prizes for the best ones. Here is how one little French-Canadian girl, aged fourteen, from a village in Northern Ontario, in apt lyrical fashion, summed up her feelings after she had seen the documentary film "Forward Commandos."

"I am a little girl fourteen years of age, but I too can be a Commando. There are those here who ask, how can you do that? Well, here is my answer. I can work for the soldiers by knitting, by buying War Savings Stamps, by making small sacrifices, and by economizing even in school, by not wasting paper and other material, and by not raising objections to the rationing of any item. Yes, let us work for victory, that victory which we have been seeking so long. Only have confidence and we shall win this war. Yes, win this war. Let us then be patriots, true patriots and leave aside complaints. Let us be gay. Let us sing songs of victory."

The country school teachers have their scholars study in advance the contents of the leaflets describing the films, and so when the National Film Board projectionist arrives at these schools, the first thing he does before the screening begins, is to conduct a "quiz" on the contents of the booklets.

During the winter of 1942-43, most projectionists had to buck snowdrifts and sub-zero weather for months on end, yet not even the worst conditions of weather ever daunted them. Their motto was "the show must go on". Most of them found their reward in genuine evidences of local appreciation. From North Battleford, Saskatchewan, came this poignant note of human interest: "The incident concerns a widower of seven years past. This man informs me that he has come to town during the last seven years only when the need for supplies made the trip necessary. He visited one of our showings last fall and was very pleased. Since then he has

never missed a showing. On his last trip he had to brave a strong wind and a temperature of forty below zero to walk seven miles to town, all because it was the day the Free Movies were in town. This man can neither read nor write. His great worry is that he may get the wrong date fixed in his mind. Thus, after each showing, he asks me, not once but several times, when I will be in town again. After this is firmly fixed in his mind, he shades in the date on a calendar. It is a revelation to see the morale improvement in this once apparent outcast. Is this one saved soul not of greater value than three or four hundred patrons who have received most of earth's blessing and who attend merely to be amused?"

Some extremely remote points are visited by these travelling theatres. R. B. Anderson, on his circuit in northern Manitoba, is on the verge of frontier settlements. "At a small place called Barrows," he reports, "I travel five miles by sleigh from the railway to visit a country school. Here the whole community, mostly half-breeds, turns out. About one hundred and twenty-five people always flock into the pool room, the largest place in town, to see the show. The Indians present come from miles away, in sleighs, on foot, or by dog team."

Mr. Thomas Prime, who operated a circuit during the summer months in the northern interior of British Columbia, visited the Tweedsmuir Park area which is over fifty miles from the railway. He reported that in some of these communities, people came vast distances to attend the showings. "At one point a group travelled forty miles by canoe, others anywhere from five to twenty miles, sometimes even on foot. We are in touch with people who know little or nothing of world conditions of the present day. In fact they are out of reach of all communication. The showings have drawn people that have seen a moving picture for the first time. Every known type of hall has been used for the presentations, including attics of stores, log cabins, and at one point we had to show in the open."

The monks at the monastery of St. Viateur, in the far distant colonization area of Abitibi in Quebec, requested and obtained special screenings once a month during most of 1943.

Time and time again the film showings are merged with other wartime activities in these small communities. To quote a report from Manitoba:

"The Inwood War Savings Committee was first organized in January, 1941, for promoting the sale of War Savings Stamps. The National Film Board and the Adult Education Services of the University of Manitoba offered to put on a series of free educational picture shows if some local institution would sponsor these.

"The Inwood War Savings Committee gladly accepted this small responsibility and, for the first two months, the shows were held in the Lutheran Church. . . . We found the people were so interested that we were obliged to seek a larger hall to accommodate them. The local hall was rented, but pro-

vision had to be made for the payment of rent, so it was deemed advisable to put on a dance and sell lunches after the show, in order to raise money to meet expenses. The dance turned out so well financially that we decided upon a dance after every show, the proceeds put to some good use. . . . To date we have sent cigarettes to the lads overseas to the value of \$98.00. We handed \$80.00 to the Women's Institute to assist in sending Christmas boxes to every lad that is overseas from this district. Then we sent \$127.00, the proceeds from two dances, to the Russian Relief Fund. After all expenses were paid, we still have \$12.00 on hand and \$50.00 Victory Bond."

In some senses a panorama of Canadian opinion—the rural point of view at least—can be obtained from the expressions voiced after the evening showings. For this reason, the projectionists are now being trained to gather and to make reports on these opinions, so that there may be a two-way transmission of ideas—interpretations of democratic plans and war objectives presented to the people in these films, and, in return, comments and suggestions collected and sent back to Ottawa. So to this end, regional training conferences for projectionists were held in Saskatoon and at Macdonald College in Quebec during August, 1943. This method, of course, is still new and relatively experimental. Yet what has taken place in various communities to date proves that this is rapidly becoming a worthwhile venture in the use of modern means of communication in the service of citizenship. At the moment, the comments received are serious and sustained in vigour. Documentaries which merely give the broad outline of global strategy are criticized—more detailed treatment of specific achievements and projects is asked for; as one projectionist puts it, "the primary objective" of these programmes should be that "of giving the people a more complete insight into our war effort". So more motion pictures of this nature are being made to fill the demand.

There are also many requests for films about post-war reconstruction. These come from all sections of the country. To-day the building of programmes is related closely to the needs of the rural audience. Then too, a close co-ordination between these films and the topics discussed each week on the broadcasts of the National Farm Radio Forum, has been achieved. In fact special 16mm films such as "Farm Front," "The People's Bank" and "Hands to the Harvest" were produced during the past season for use in conjunction with these radio programmes. There is more emphasis now on the contribution of the individual in this struggle, and of the part the ordinary citizen plays in democratic planning. This change in emphasis, according to the regional agents, has become "one of the chief factors in stimulating interest and intelligent discussion." As for the future, one report comments, "I think we should learn more in films of the different peoples of Canada right now—so that when the present conflict is over we may be able to understand our neighbors a little better and have a higher degree of tolerance."

# Student Participation in a Guidance Program

School-made Kodachrome 2 x 2 slides can function importantly in the educational program.

**GLENN N. GARDINER**

Head, Industrial Arts Department  
Dana Junior High School, San Pedro, Calif.

**A**FTER the sound of the clicking camera ceased and the bright lights faded, Dana Junior High found that it had photographed itself 300 times over! We used a 35mm camera with fast panchromatic film and two No. 4 photofloods. All shots were taken at one-fifth of a second and at stop f:11. The lights were moved forward or backward in order to get the correct exposure as indicated on the light meter.

The films were processed and positive prints were made. Many of the shots were taken in sequence and these were left together in the positive as a film-strip. The individual shots were cut and mounted in 2" x 2" slide binders.

**What did we photograph?** Every subject in the curriculum, student functions and activities, and the school plant itself was photographed. We tried to avoid artificial posing in our shots and to shoot the normal condition of what was going on at that particular time. We kept in mind student interest and wherever possible we gave them opportunity to participate in developing this project.

**How have these slides helped the guidance program?** During the B8 term each student must choose electives to be taken during the A8, B9, and A9 terms. A program was organized with student speakers chosen to represent the various electives offered at Dana. Slides were used to illustrate the talks as each expressed his opinion of his elective. The students received a clear understanding of the work covered in each of the courses.

Another set of slides, accompanied by student speakers, visited the A6 students at the various elementary schools in San Pedro. The slides proved most valuable in this question-and-answer program in orientating the students before they entered the Junior high school.

Still another set of slides, with B7 students as speakers, presented a program at the A6 visiting day entitled: "A Typical Day At Dana For A B7." New responsibilities, such as: lockers, books, home room activities, and nutrition were pictured along with the talks.

**What other uses have been made of these slides?** A series of slides have been shown to the P.T.A. to familiarize them with the schools' educational program. Also, public relation programs have been presented at various business and civic luncheons using these slides. Students are always used as

Some of the curricular activities Dana Junior High recorded on slides, showing: (from top to bottom) Gardening, Science, English, Cooking, Health and Industrial Arts classes.

# MOTION PICTURES— NOT FOR THEATRES

By ARTHUR EDWIN KROWS

WE thought of presenting the teaching factors in story form. Howard Stokes had conceived for it what appealed to Brill and me as a highly attractive idea. The story was to deal with a musical evening at home. Here was the sense of it: Mother and Father played certain stringed instruments for their own relaxation, and on this particular evening were entertaining friends who played the other instruments in the string choir. The young son of the house had been sent off early to bed so as not to interfere with the adult pleasure. But, instead of going to bed, Junior sets his door ajar and accompanies the downstairs quartet with his home-made fiddle, consisting chiefly of a cigar box, a broomstick and a string. His scratch is heard just at the close of the opening number.

The father, who has purchased the boy a proper violin and cannot understand why he prefers this crude affair, starts upstairs to reprimand him. But the neighbor husband asks to handle the matter, goes to the boy's room and tactfully draws him into a discussion of his fiddle. He hails it as a counterpart in principle of the early monochord, and, by telling Junior then the story of the evolution of the modern violin, persuades him of the greater advantages of the instrument given by his father. Thus the boy expands his point of view, and, as the picture ends, he is downstairs with his friendly teacher, having a try, himself, at playing the viola part in the choir.

Of course we had difficulty obtaining musicians who also could act, but Brill made a satisfactory compromise by casting them personally. I was quite happy over the opportunity to produce what seemed to me to be a really constructive effort.

The scenario was written, continuity approved and the picture was made with Brill himself as research consultant on set. But when the result was shown to the committee, a violent reaction set in against it. The feeling grew. It was eventually held to be pedagogically so unsound that without ever trying it out, it was shelved permanently, and a rule was promulgated that story form was thenceforth prohibited in any teaching film which we might make. The stodgy old lecture form of presentation returned, and I confess to chafing greatly under the rule. However, I was heartened that Stokes, who knew so well that time works wonders, took it all so calmly, and I became submissive, too.

And, sure enough, in a few weeks the committee relaxed. About a year later they went recklessly into a story subject to supply the lack of a picture in our list for the very small chil-

dren. It was called "Jack and Jill in Songland," was written by Brill, produced by Bartlett, and was literally filled with fairy hocus-pocus and bids to the infant imagination.

## Classroom Talks

A SURVEY to determine the most-needed school films had turned us to music and also to the subject of vocational guidance. Under the latter heading I made a new and much-used one-reeler presenting Dr. Kitson. The very admirable scenario was composed by Marian Lambert, a clever advertising writer in the field of radio. In this Kitson film I tried the successful experiment of pre-scoring the sound. That is, I recorded Dr. Kitson's lecture first, and the illustrative action, which it was designed to accompany, was produced later and cut to fit. This was already an established practice in making sound

Dick Chapman had a reputation for bringing back the picture without annoying people who employed him.

cartoons, but, so far as I know, it was never previously done with an acted picture.

The central figure in that reel, next to Dr. Kitson himself, was portrayed by Johnny Downs, who is today a featured adult player in Hollywood. Roy Phelps was the cameraman, and Richard Chapman shared direction with me, making those scenes in Florida which were necessary for summer atmosphere during a northern winter. For vocational guidance also, Chapman directed the shooting of high spots in the erection of the Empire State Building in New York, for a narrative read by Harry Morey, one-time star at old Vitagraph, who was first tested by our director of research to see if he could do it.

Part 58.—An anecdotal account of ecclesiastical and secular talking picture experiments made by Erpi in the early thirties ends the sixth year of our continuing history of films

Physical education was another department in which pictures were deemed needful, largely because such departments in educational institutions frequently have ampler funds to squander on visual education. The specific subject scheduled to be first here was football. The basis was a plan prepared by W. L. ("Bish") Hughes, associate in physical education at Teachers College, Columbia University. His plan had been formulated, it was said, after consultation by correspondence and otherwise, with a thousand high school and collegiate coaches across and up and down America.

To give the plan magnitude and high authority, a luncheon conference, with Hughes present, of course, to demonstrate his stipulated blocks, tackles and punts, was given in the Erpi board room, with some of the best known native coaches present. There were E. K. Hall, chairman of the Football Rules Committee and incidentally himself a Bell System man; W. A. Alexander of Georgia Tech.; Walter Okeson of Lehigh; Lou Little, Columbia; J. R. Ludlow Wray, University of Pennsylvania; Capt. L. M. ("Biff") Jones, former head coach at West Point Military Academy; H. E. von Kersberg, of Harvard, and W. G. Crowell of Swarthmore. After the luncheon these gladiators rolled and tossed about the startled board room until all were in agreement about what we should do.

A few days later I began work with "Bish" Hughes and the University of Pennsylvania football squad which was then in training near Ludlow Wray's home at Beach Haven, New Jersey. As cameraman I had Roy Phelps, mainly because he was so well known as a specialist in photographing sports at Yale. Otherwise, everything essential had been arranged by Hughes and Wray. The production procedure was for Hughes to show me what he wished to demonstrate with Wray and his men, and then I would show him how I felt it might be made most effective for the screen. When Wray and he approved, we shot it.

I was careful to time every piece of action so that later, when we came to record Hughes' lecture, there would be ample time for him to utter all required comment. To make additionally sure, he frequently extemporized the comment at rehearsal, and I generally prolonged the action still more by repeating it before the camera in ways which would not be monotonous to the eye. For example, in showing a method of blocking, I set five or six men at intervals in a line away from the camera, and had a tackle run down the line toward the lens, charging each

man who blocked him in precisely the same way as he advanced. A favorite, though rather obvious device, was to repeat the action in slow motion. When I had the main action of a sequence established and timed, I then made the general shot and moved in for additional angles, or had Roy change lenses for closeups, a usual production practice when using a single camera.

When the rushes came through the laboratory, Hughes began preparing his lecture. And I started cutting the subject, overlapping our varying angles and closeups for continuous action. This resulted, as was to be expected, in the elimination of extra takes and other excess footage; but it also put the subject at its originally estimated length of two reels. When Hughes saw this assembly he protested loudly. I had not allowed him nearly enough time to comment, he said, and he averred that he had thought, when I was making my varying angles and closeups, that the repeated action was to give him that much more material.

He was so insistent to the committee, and I had so little time to argue with him despite the witnesses I could readily have called, that I turned the rest of the cutting over to Bartlett and went on with another production. Bartlett could do no more, of course, than give Hughes what he wanted; so the subject, in four reels instead of two (useful enough in its way, no doubt), was eventually released with nearly all of the takes joined end to end, an original technique which certainly had never occurred to me. A little later, though, this odd set of pictures was completely eclipsed in effectiveness by an elaborate and beautifully produced series made for popular interest in the theatres, by R. C. A. recording, featuring the celebrated Knute Rockne of Notre Dame.

None of the classroom headings in the early Erpi series was more important than natural science, and ironically enough, the pictures presented there comprised a group of films produced elsewhere before the days of talkies. In England, where many were made by and under the supervision of F. Percy Smith—surely an "old master" in that line of work—they were known through the theatres, where they were extremely popular, as "The Secrets of Nature" series. The entire set, I believe, contained some two hundred titles. Rights to use them on this side of the water were offered to Erpi by Capt. Harold Auten, who, in 1929, had been appointed American representative of British Instructional Films.

Erpi made a preliminary selection of less than a dozen but took options on a number of others. They already bore valuable, authoritative accompanying lectures recorded in England; but the Erpi educators felt that it was advisable and even necessary to revise both lectures and scenes—even to make a few new pictures—in order to meet the needs of the American curriculum. It always seemed to me a little more ironical, however, that with all the screen

credits to the new sponsors and educators who worked on these acquisitions, in all the printed circulars and teachers' handbooks, I saw not one shred of mention of the men and women who actually produced these marvels of unending patience and observation. And I am sure that among those named on the screen here as pedagogical experts were many who, upon hearing mentioned the names of F. Percy Smith and Mary Field, would have murmured, "Who's he? Who's she?"

The substitution of new lectures and the reciditing of scenes, together with new main titles in a few cases, such as "How Nature Protects Animals" for "Safety in Hiding," "Plant Growth" for the celebrated "Peas and Cues," and "Beach and Sea Animals" for "Sea Level," also gave Erpi some legally protectable rights. This was really important. It turned out later that in the confusion over the years in selling *all* rights and partial rights variously for long and short terms, some items had apparently been sold more than once while older contracts were still in force. For instance, it was discovered, about 1936, that Erpi had unwittingly purchased rights to two or three dined negatives, the originals of which had been bought outright years before from Charles Urban by another party. Fortunately, that party was a man of peace and understanding. His name was Walter Yorke.

In Erpi's original list of home-made product, one odd number was produced in the department of mathematics, principally as an exhibit to prove the value of talking pictures in teaching abstract subjects. It was prepared and presented with comment by Dr. David Eugene Smith, professor emeritus at Columbia University, and author of many celebrated textbooks. He insisted upon lecturing for the record spontaneously, even in the long stretch when he did not personally appear on the screen, instead of reading from a customary script, and the result in places was a little mystifying to audiences which did not know the circumstances. The title was "The Play of Imagination in Geometry."

However, Dr. Smith did not try, as is so frequently done in such circumstances, to tell us *how* to produce his work; but he very sensibly told us *what* he wanted to see upon the screen. There really is quite a distinction there. The body of the picture was to consist visually of geometric figures which, by constant, fluid changes, would show how the simplest conceptions of that sort are related to, and are inherent in, the most complex forms. It was to explain that lines are mere extensions of points and planes simple extensions of lines. I only wish Dr. Smith had stopped there. In all events, to a layman like me, that would have been a stimulating presentation. But, somehow or other, a few controversial, abstruse ideas crept in.

Obviously it was an animation-table job, the chief problems of which were in showing moving rounded surfaces of cones and spheres, with the added

troubles of making them appear transparent, because this meant successive drawings made with an airbrush and therefore extremely difficult to keep uniform in photographic values. This was eventually done with much effectiveness by Ferdinand A. A. Dahme. However, in order to explain to the animator what should be done from our own production standpoint, I myself obviously had to understand what it was all about, so Dr. Smith placed at my service one of his star students, Aaron Bakst, author of a unique monograph on the sextant.

Starting with the film's intended picture of a pair of railroad tracks vanishing at the horizon in both directions, Bakst patiently explained to me that persons who think that two parallel lines never meet are uninformed in the discoveries of modern science. Geometrically speaking the lines do meet beyond the horizon, cross as they curve down beyond it, cross again coming up to the horizon at our back, and so return to where we stand. Without intent to argue about a subject in which I am notoriously weak, but merely to comprehend what was to me a startlingly new idea, I thought about popular newspaper accounts of recent Einstein theories of light rays which curve in space, and inquired, "But isn't there a recognized school of scientists which believes that two parallel lines ultimately do *not* meet?" Bakst smiled at my naiveté. "There is," said he, "but they're all nuts."

### Mainly For Churches

IT WAS the theory of Erpi, of course, that the pictures which we would produce would be those which licensee producers could not profitably make, meaning that we would not be setting up competition with the licensees, but that, such work, having been started by us to show the way, the market would be opened for the licensees to carry on. It was a theory which time and experience were to modify, but it was sincere enough in its origin. No licensee would have undertaken unaided production of our important school program, for instance, and certainly none of our affiliates was doing anything to develop the church field.

Pictures for the churches had been in the Colonel's mind from the beginning, and, of course, Donnelly was working at the Catholic possibilities as Wendell Shields was concentrating on the Protestants. Like the salesmen who had other assignments they repeatedly urged the importance of having demonstration pictures in their own lines. Shields, in particular, had kept the recommendation alive by suggesting various compromise means of obtaining specimen subjects at moderate cost. On various occasions his father, the Rev. James K. Shields, was introduced with plans, once with the idea of adding sound to his long-circulated "Stream of Life," and again to see if Erpi would produce his favorite project, the "Life of John Wesley." But the Colonel's idea was to make the demonstration films when

there was clearly to be seen either a really waiting market or a licensee producer who would embark on a sizeable program of additional subjects of the kind.

Late in 1932 there came to Col. Devereux, a young man of some training in the Swedish Evangelical Church, named Milton Anderson. He bore a proposition of his own to establish a complete and continuing ecclesiastical film service under the name Academy of Religious Arts. Headquarters were in Los Angeles, at 718 West 8th Street, which I believe was the address of the parsonage of Dr. W. S. Dysinger, pastor of the First English Lutheran Church, who was associated with Anderson in the plan. Anderson had no personal funds to speak of, but he was a hustler, and he seemed to have an idea.

All he wanted was for Erpi to make him "the first talking picture church service," that he might take it forth to convince clergymen of the merit of his project. When he had signed a sufficient number of these gentlemen to justify and support production on a large scale, the further work would then be done, of course, under an Erpi production license. For the first production he would supply the talent and arrange the program. Erpi had only to provide studio, working crew, sound and picture recording apparatus, lights, director, cameraman, film, laboratory facilities, editing and final prints. That was all. Nevertheless, Erpi's gamble on the future seemed worth while, and, even in the event of Anderson's failure to become a licensee, we would have a Protestant demonstration talkie which would have promotional value in the church field. So the Colonel consented.

Anderson was turned over to me for development of his immediate idea. He had no scenario and no certainty as yet of the talent he might procure, but he was impatient to be off to Los Angeles with the completed two reels allotted him under his arm. The production simply must be made in the next three days. The few hours' interval between this afternoon and evening he would spend drumming up his company of stars. They were to be volunteer numbers. Of course, I simply had to slow him down. All we were actually able to prepare in the first two days was a definition of limits. It was very difficult to persuade him that two reels were all to be given him. He could have only twenty minutes of screen time, and, as much as the condition might harrass him, he had to decide on the time apportionment for each item before I would proceed. There could be no scenery other than what might be suggested with the aid of monk's cloth drapes; no money appropriation had been made to supply anything else.

Until the day before I was to produce the subject I did not know precisely what was to be in it other than what came to me in cryptic telephone bulletins from Anderson who was racing about the city arranging for his people. About 4:00 P. M. I was made

Rev. Ralph W. Sockman, of Christ Madison Avenue Methodist Episcopal Church, rendered the sermon in "the first Protestant talkie service."

aware definitely that we would have a male quartet; a soloist interpreting a Psalm of David in appropriate costume; a Y. M. C. A. secretary to give "a business man's talk"; a minister to deliver a short sermon; and another Reverend to utter the benediction. The most serious difficulty for me was that Anderson had consented to their successive appearances on a time schedule to suit their convenience, each to perform his act at such-and-such an hour and hurry away.

So as not to upset the delicate licensee situation, and to preserve the full character of the subject as an experimental venture, my work was done in the new studio of the Bell Telephone Laboratories. The quartet appeared, but one member could not or would not wait till we were ready, so, on the spot we had to make that number a trio. The well-intentioned Y. M. C. A. secretary had prepared a rambling speech on the wonders of modern science and, suddenly realizing that he was making rash technical statements in the premises of one of the greatest research organizations in the world, made so many mistakes that we had to omit him. The soloist was admirable. The Rev. Dr. Sockman was a joy to hear, and the speaker of the benediction was properly impressive. In such circumstances the "first talking picture church service" was produced in an afternoon and about two hours overtime.

Duly edited to length and "dressed" as much as was practicable with decorated titles to fill the screen for some "dubbed-in" organ music, the reels were forwarded to Anderson who, by this time, had gone westward. He received them with much professed thankfulness and promptly gave a local church dem-

onstration which he reported was a huge success. Then someone in Hollywood told Anderson that his picture was not good enough. More should be put into it. In the spirit of that theatrical producer of years ago who felt that only twelve disciples in a Lord's Supper scene did not make sufficient show and hence provided forty, he was urged on the subject of "bigness." And Anderson, of course, was entirely willing to have improvements provided that they did not cost him any money.

He turned the power of his salesmanship on the Erpi office in Hollywood, and apparently persuaded the officials there that the Bell System owed him something further. Pat Campbell emerged from his role as a business representative and became a director. Anderson obtained some further talent, a lay church reader, Alec B. Francis, who was also a well known, veteran character actor in theatrical films; an excellent female choir of perhaps forty voices; the numerous members of a Los Angeles dramatic school to enact a parable, and some alleged "Holy Land" stock shots, including a few surprising snow-clad mountains, to illustrate the soloist's *Psalm of David*. There was a professional studio this time, and some fair-sized sets. Pat did himself proud; the subject was indubitably enhanced, and the length naturally expanded to three reels.

Anderson now took his revamped subject to various West Coast communities, obtaining little financial encouragement but much praise. Nothing but fame becomes rather unsatisfactory, so Erpi heard less and less of his project. But, in 1932, Milton Anderson found someone in Los Angeles to publish a book, written by himself, on the future of pictures in the churches. It was not very long, but long enough to sell their high-priced but quality person and commendation of his efforts. The efforts of Erpi, it seemed, were not so praiseworthy. He mentioned Electrical Research Products, Inc., in it as having "unsuccessfully attempted to sell their high-priced but quality equipment in the non-theatrical field without pictures." That was assuredly not true.

"It is generally understood," continued Mr. Anderson, "that they will not produce pictures (excepting experimentally) because they fear that Congress will accuse the monopoly of proselyting in school, church and home. . . . If such organizations as the National Educational Association and others were to insist, they would undoubtedly give further help to the non-theatrical field." Anderson entitled his book *The Modern Goliath*, referring, of course, to the modern talking picture. More fitting, I think, that he should have called it *Et tu Brute*. It really needed another name, because the U. S. Bureau of Mines had produced a subject called "The Modern Goliath" years before.

(To be continued)

# The Film and International Understanding

DR. JOHN E. DUGAN, Editor, Haddon Heights, New Jersey, Schools

## "Men of Tomorrow" Stresses World Understanding

**A**N educational birthday film with a world outlook has been made by the Y.M.C.A. to commemorate its 100th anniversary this year. Titled *Men of Tomorrow*, the picture has an educational value far beyond its original intention; for this birthday is a birthday with many implications throughout the world. Appropriately enough, the film was made by Julien Bryan, whose pictures of Poland and South America already have done so much to improve American understanding of other parts of the world. The narration by Lowell Thomas strikes an authentic note of world vision.

*Men of Tomorrow* shows the founding of the Y.M.C.A. as a group of twelve young men under the leadership of George Williams in London in 1844. An animated sequence, in which white triangles multiply on an expanding map of the world, shows the expansion of the Y.M.C.A. into an organization of tremendous membership and unnumbered services throughout the world.

Moving from the international framework to our own national presentation, the sequence shows the growing flood of triangles entering a map of the United States and rapidly covering the whole nation. Numerous activities of the Y.M.C.A. in this country then are presented dramatically and effectively. These are presented in such a way that boys and young men can see the many opportunities for self-improvement which the "Y" offers them and so that adults can recognize the potentialities of the Y.M.C.A. as an organization for desirable community development through service to youth.

Just as the animated sequence moved from the international to the national, so the film's pictorial presentation of activities in this country shifts unobtrusively to the world scene, showing services which the International Y.M.C.A. today is rendering throughout a global world at war.

The picture closes with a rapid sequence of shots of boys of all ages and countries. The commentary which accompanies this final part of the film speaks alternately to adults and to youth, and must be quoted to be appreciated:

"These are the boys who shall tomorrow inherit the earth. Let us all work together to make them strong in body and generous in thought and deed so that the world of the future may be made by them a better world.

"Yes, young men, we must, we do put our hopes in you. From every race and creed and nation, your dream is the ancient dream of humanity, the dream of true brotherhood among men.

"Let us work with good faith and strong hearts to make their dream a living reality.

"God speed you, young men of tomorrow!"

The film is made expertly and well, and it has educational values for above those of any mere anniversary presentation. It is an object lesson on the way in which local and familiar activities may be presented in a framework of world service and understanding.

## Survey Shows Need for Films on Other Nations

Helen Hardt Seaton

---

**Editor's Note:** Helen Hardt Seaton is Executive Secretary of the Committee on Visual Aids in Education of the American Council on Education. The work of that organization in the field of visual education is too well known to need further description here. The article is based upon data gathered in a recent survey.

---

**A**RATHER extensive survey of teacher opinion on needs for new motion pictures which we recently have completed has indicated a need for films on other nations of the world. Although the survey has not brought forth any startling points in this connection, the suggestions received serve to reinforce many of the points which already have appeared in the department on "The Film and International Understanding" in EDUCATIONAL SCREEN.

The survey was undertaken as the first step in isolating areas for which films should be produced in the postwar period if a full development of visual methods is to be achieved. A brief questionnaire was sent out to more than 2,000 teachers throughout the country who use visual aids in their teaching. This questionnaire included a check list of eighteen subject matter areas. The check list was followed by a request for suggestions of films or series of films within the checked subject matter areas and some indication of the kind of film treatment preferred. More than 800 teachers returned these questionnaires. Teacher suggestions were then compiled within the various subject matter areas.

The original compilations, although interesting for the trends of teacher opinion which they indicated, were, of course, nothing more than compilations. These were, therefore, sent to a selected group of about 300 for further comment. Comments were also secured through interviews with teachers and directors of visual education. On the basis of these comments some tentative conclusions of a more specific nature can be drawn. Preferred subject matter areas for film production seem to be Art, English, Geography, Guidance, American History, Mathematics, and Social Studies.

Twenty preferred series were selected from all subject matter areas. Among these twenty series were those on: Global Geography (secondary), United Nations (elementary and secondary), Regions of the World (elementary), Industries the World Over (secondary).

Although space does not permit us to go into great detail here, a closer look at some of the suggestions received in the survey is interesting.

In the field of Geography it appears that although many schools have used films in geography, they express dissatisfaction with the usual travelog and ask for better films. Greatest interest on all grade levels from the upper elementary through high school is for films emphasizing the emerging concepts of global geography.

The following subjects were among those suggested in this field:

Series on "Global Geography"—"The Arctic"—a film which would deal with the geography, the people, and its emerging importance in world communication; "The World Island"—a film which might be based upon a projection of the world with a land pole at Dover. This film might be used as the basis for several succeeding films such as: "The New Mediterranean Sea"; "Natural Resources of the World"; "World Population, Past, Present, and Future."

Series on "The United Nations"—particularly China, Russia, India, Australia, designed for elementary and secondary schools.

Series on "Industries the World Over"—secondary. For example: "Rubber"—discovery, history, plantations around the world, how it is grown, gathered and shipped, use in various countries, social and cultural influences; "Petroleum"—etc.

Series on "Map Study"—elementary and secondary—"History of Maps"; "How to Use Maps"; "Maps in Everyday Living."

Series on "Regions of the World"—arctic, tropics, deserts, etc.—elementary.

Replies on the questionnaires indicate a need for background films in the modern languages, but not a widespread recognition of this need. Films are requested for secondary and college levels. Background material on life in the various countries, either with the commentary in the language of the country or with direct dialogue in the language of the country, was generally suggested. A series on "Folk Songs of Other Lands" was suggested in the field of music.

There is an interesting trend which reveals itself in those parts of the survey which we have discussed. It is a trend toward an interest in people rather than things, an interest in human rather than abstract consideration and presentation. In commenting on the series on the United Nations (which many teachers suggested be changed to include all nations) teachers indicated that they wished the emphasis to be on the lives of the people. They wished the films to bring out similarities to, and differences from our own way of life, and they wished to have the causes for these differences and similarities made very clear.

After all, how can we better understand other peoples than by comparing them with ourselves and understanding what causes similarities and differences.

#### Additional Summer Courses in Audio-Visual Aids

Three more courses in Audio-Visual Education have been reported, supplementing those which were listed in our April and May issues, namely:

<i>University of Kentucky</i> , Lexington	June 12-July 19
Motion Pictures in Education (4 qr.)	Mary Rees Land
<i>University of South Carolina</i> , Columbia	July 3-Aug. 24
Audio-Visual Education (3)	D. L. McCormac
<i>University of Washington</i> , Seattle	July 3-Aug. 25
Auditory and Visual Aids to Teaching (2)	Alice Hayden
Individual Research in Production of Radio Records and Picture Aids (credit to be arranged)	Jacobsen

## The Fiftieth Anniversary\*

IT is interesting to recall that the motion picture camera was invented before there was any film to use in it. As early as 1887 Edison started work on "a machine that should do for the eye what his phonograph did for the ear." By mid-year of 1889 a mechanism had been evolved. It required a flexible medium to carry the negative base over sprocket wheels and past the lens of the camera. A picture tape of collodion varnish, dried on glass, was tried but it was too fragile. By September, word came that George Eastman had evolved a tough flexible material to meet the "roller photography" requirements of his Kodak. A sample, an inch wide and fifty feet long, was obtained from Rochester. It was the stuff that the motion picture machine was waiting for. The frail varnish skins suggested the name for the new medium, "film." The dimensions of that film are standard today. But, that October of 1889, Mr. Edison was too busy. Perforce he neglected his new creation until he started to make a set of machines for exhibition, along with his phonographs, at the Chicago Columbian Exposition (World's Fair) in 1892. The Fair was late ('93), but the machines were later ('94), and hence the opening on April 14th, 1894, in New York City.

Meanwhile Edison, inventor of the motion picture, and Eastman, father of the film, had never met! Amazingly down through the years when the motion picture was growing into a world-wide industry they still had no contact. They were both too busy. Then came the day, thirty-one years later on February 15, 1925, when the organized industry gave a great luncheon function in Edison's honor at the Ritz-Carlton in New York. Will Hays presided. As the functionaries and eminent guests were arriving, Mr. Edison and Mr. Eastman came in and reached the cloakroom together. There was no sign of recognition between them. A mutual friend noticed this and introduced the famous pair. The towering Edison grinned down at the brisk Eastman.

"So, George Eastman, the film feller."

"Yes," said Eastman.

"Heard a lot about you," said Edison.

"I've heard about you too," replied Eastman, "I bought a dynamo from you about 1885."

"Was it any good?" Edison demanded.

"It will still work, but we don't use it now."

A smile from each, a handshake, and they went their separate ways to the luncheon room.

Not long after that first public exhibition, the motion picture began disseminating war information. For the Spanish-American War, the Boer War, the Boxer Rebellion, there was scant coverage, but the mere fact that the American public could see war action on the screen was an important milestone. In the catastrophic global war of today the motion picture has grown to full stature as a medium of information and service. In his New York office Major Hubbell calls a Corporal and hands him a can of new film just out of the laboratory. "There's a car waiting in the Rockefeller Center Garage. If you'll drive this film to Newark airport, it will be in India day after tomorrow." Our fighting forces, overseas in combat areas, often see the latest movies before their families back home can see them. In almost every community in the United States there is a motion picture theatre serving the nation in the dissemination of government messages, in the sale of war bonds, in the collection of monies for wartime causes, in the collection of blood plasma, in giving surcease to war-torn nerves.

Just a bit, this, of the story of fantastic growth, of amazing achievement, during the motion picture's first half century. From the first fifty feet of film in Room Five, Edison's Laboratory, visible only to eyes at the peephole—to countless thousands of miles of film girdling the world, visible to the eyes of all nations of the earth—and in fifty years!! It out-fantasies the Arabian Nights, this prodigy of celluloid that has already become a "commonplace" to the second generation of all mankind. Here indeed is a fiftieth anniversary that deserves celebration.

\*Partial reprint from *Motion Picture Letter* by Terry Ramsaye.

## Important Audio-Visual Education Meetings in July

### NATIONAL DVI MEETING

In conjunction with the Regional NEA Meeting  
**Tuesday, July 4th, 9 to 12 A.M., Marine Room,  
 Hotel Roosevelt, Pittsburgh, Pa.**

General Theme will be *New Trends in Visual Education*. Speakers and discussions will include Lt. Gordon MacKenzie, "Audio-Visual Aids and the School Curriculum"; James S. Kinder, "Audio-Visual Aids in Adult Education"; Encyclopedia Britannica Films will describe the set-up of the new organization; and "The Library's Place in Visual Education" will be expertly presented. Discussions from the floor will be a feature.

(Complete program not available for printing in this issue.)

### THE SIXTH MIDWESTERN FORUM ON VISUAL TEACHING AIDS IN CO-OPERATION WITH Zones III and IV, Department of Visual Instruction NEA, July 21 and 22, 1944

Room 159, Belfield Hall,  
 The University of Chicago, Chicago

Meeting in Conjunction with THIRTEENTH ANNUAL CONFERENCE FOR ADMINISTRATIVE OFFICERS OF PUBLIC AND PRIVATE SCHOOLS, JULY 17-JULY 21.

**Friday, July 21**

Visitation of Exhibits (2:30-7:30 P. M.)

Old Gymnasium, Belfield Hall

**Evening Session (7:30)**

Theme: *What Can the Schools Learn from Wartime Uses of Visual Aids?*

Four types of wartime films will be shown: Skill, Information, Understanding, Indoctrination

Panel Discussion — Chairman: William F. Kruse, Bell & Howell Company. Panel Members: V. C. Arnsperger, William J. Hamilton, Lt. Com. Francis Noel, Paul H. Sheats, C. R. Reagan, a representative of the U.S.O.E. and other agencies.

**Saturday, July 22**

**Morning Session (9:00)**

Theme: *The Unique Contribution of Visual Aids in Developing Inter-group Understandings*

Chairman: Joseph E. Dickman, Director of Science and Visual Instruction, Chicago Public Schools

"Understanding Between Nations"—showing of Julien Bryan film "Chilean Housing"

Speaker: Wesley Greene, National Film Board of Canada  
 "Understanding Between Races"—showing of O.W.I. film, "Henry Browne, Farmer"

Speaker: Allison Davis, Ass't Professor of Education, University of Chicago

"Understanding Between Socio-economic Classes"—showing of Human Relations film, "Alice Adams"

Speaker, Mrs. Esther L. Berg, Junior High School 99, New York.

**Afternoon Session (1:30)**

Theme: *Visual Aids in the Postwar Period*

Chairman: Stephen M. Corey, Educational Adviser to Encyclopaedia Britannica Films and Professor of Educational Psychology, University of Chicago

*Who Will Make Them?*—Speaker: Don C. Rogers, Assistant Superintendent of Schools, Chicago

*Who Will Distribute Them?*—Lawrence C. Larson, Chairman of the Board of Directors, Educational Film Library Association, Inc., New York

*Who Will Pay for Them?*—John Guy Fowlkes, Professor of Education, University of Wisconsin

*Who Will Use Them?*—Ernest C. Waggoner, Director of Science and Visual Instruction, High School, Elgin, Illinois

### First Annual Meeting of the Educational Film Library Association

EFLA will hold its first annual meeting of members and visitors in cooperation with the Sixth Midwestern Forum on the University of Chicago campus, in Room 214, Blaine Hall. The Association's business and conference sessions, which began 2 P.M., Thursday, July 20, will precede the general program of the Midwestern Forum which starts 7:30 P.M., Friday, July 21.

The Thursday afternoon session will be devoted to a general discussion of the policies followed and projects undertaken by the Association during the past year; a consideration of questionnaires returned by members regarding advisory and planning committees which should be appointed by the Association; and the appointment of conference committees dealing with needs, problems and issues in this field. The Chairman of the Board and Administrative Director of the Association will give their annual reports at a dinner meeting beginning at 6:30 P.M. The dinner meeting will be followed by meetings of committees appointed during the afternoon session.

The Friday morning session, opening at 9 A.M. will consist of reports of committees dealing with the advancement and improvement of all phases of the production, distribution and utilization of audio-visual aids for educational purposes.

Reports of committees will be continued at the afternoon session, beginning at 1:30 P.M. The general discussion of policies which should be followed and projects which should be initiated by the Association during the next year will conclude the final business session of the Association's annual meeting.

### VISUAL EDUCATION INSTITUTE University of Wisconsin, Madison July 17-22, 1944

All morning sessions will be scheduled at Washington Elementary School from 10 to 12 and will be demonstration situations. All afternoon meetings will be held from 1:30 to 3:30 in the Memorial Union Play Circle.

**July 17 Morning Session**

"Language Arts as Conducted under the Motivation Given by Selected Educational Sound Films"—Ruth Elder, Director of Elementary Training School, University of Oklahoma, Second and Third Grade Teacher in Laboratory School; and W. A. Wittich.

**Monday Afternoon Session**

*The Sound Film as a Supplement to the Modern School Curriculum*

John Guy Fowlkes, Director of the Summer Session: "The Place of the Educational Sound Film in Today's Curriculum"

W. A. Wittich, Curriculum Supervisor, Madison Public Schools: "Modern Methods of Using the Educational Sound Film"

C. R. Crakes, Lecturer in Visual Education, Northwestern University: "A Survey and Evaluation of Films as Supplements to Primary, Intermediate and High School Levels"

Discussion — John Guy Fowlkes, Leader

**July 18 Morning Session**

"Fifth and Sixth Grade Use of the C.I.A.A. and Encyclopaedia Britannica Films on Mexico" — Fifth and Sixth Grade Teacher in Laboratory School, and W. A. Wittich

**Tuesday Afternoon Session**

*Intercultural Relationships: The Focus — South America*

R. C. Maroney, Director of Distribution, Motion Picture Division, Coordinator of Inter-American Affairs: "The Story of the C.I.A.A. and the Development of the Intercultural Relationship Series"

Film Showing: "South of the Border"

Panel Discussion: "The Educational Implications of the C.I.A.A. Series"—W. A. Wittich, Leader; V. C. Arnsperger, Joseph Dickman, R. C. Maroney, Don C. Rogers

#### July 19 Morning Session

"Educational Sound Films as a New Tool of Learning for Science and Physics"—Joseph Dickman, Supervisor of Science, Chicago Public Schools

#### Wednesday Afternoon Session

*Understanding our Natural and Social Environment through Educational Sound Films*

V. C. Arnsperger, Vice President, Encyclopaedia Britannica Films: "Broadening our Environment through the Educational Sound Film"

Don C. Rogers, Asst. Superintendent, Chicago Public Schools: "Description of an Optimum Educational Sound Film General Course of Study"

W. A. Wittich, Curriculum Supervisor, Madison Public Schools: "Experiences in the Psychology of Seeing and Observation Relating to the Educational Sound Film"

#### July 20 Morning Session

"Use of Modern Visual Aids—Charts, Globes, and Wall Maps"—Mabel Studebaker, Editor, *THE CLASSROOM TEACHER*

#### Thursday Noon, Luncheon

Welcome—John Guy Fowlkes, Director of Summer Session: "European Experiences in Intercultural Relationships through the Sound Film"—Thomas Hodge, Film Officer, British Information Services

"The Power of the Educational Sound Film"—Showing of a composite half-hour film to demonstrate its versatility with examples of microphotography, time-lapse, submarine, and aerial photography, and trips to distant places.

#### Thursday Afternoon Session

"Modern Developments in the Areas of Charts, Globes, Maps, etc."—C. B. Statler.

Panel: V. C. Arnsperger, Joseph Dickman, John Guy Fowlkes, Don C. Rogers, W. A. Wittich

"Guides to the Use of Charts, Globes, Maps, etc."—Mabel Studebaker

#### July 21 Morning Session

"The Use of Films in High School Studies"—Ruth Fuller, Social Studies Teacher, Lincoln High School, Manitowoc

#### Dear Fellow Members:

Once again we are afforded the privilege of helping in the war effort. Through the Treasury Department and the Office of War Information, several 16mm. war films will be made available for use during the Fifth War Loan Drive, June 12-July 8. We can do our part by seeing that every State and local war bond committee is offered these films for use at all war bond meetings and that equipment is found for the showing of them.

You will doubtless feel it your duty as a good American, to search out every opportunity for showing these films. Remember "the more ways an idea comes to us, the surer we are of getting it. If we hear it, see it, read it, and talk it over, we're pretty sure to have it."

Everyone will want to see these pictures. Let us pledge ourselves as members of the Department of Visual Instruction to bring these films to every member of our community and state that it is within our power to reach.

CAMILLA BEST, President  
Department of Visual Instruction, NEA

#### Friday Afternoon Session

*Understanding War and Peace through the Use of Educational Sound Films*

Thomas Hodge, Film Officer, British Information Services: "Intercultural Understanding through the British Information Films"

J. Margaret Carter, Canadian National Film Board:—"Building Understandings of our Neighbors to the North"

Film showing: "The Maritime Provinces"

#### July 22 Morning Session

*Audio-Visual Materials as an Aid in Helping Schools Meet Present and Future Responsibilities*

John Guy Fowlkes: "New Tools of Learning for Today and Tomorrow"

V. C. Arnsperger: "The Part that Educational Sound Films Will Play in Tomorrow's Schools"

### CONFERENCE ON THE PRACTICAL UTILIZATION OF AUDIO-VISUAL AIDS

Conducted by Visual Aids Service,

Division of University Extension, University of Illinois

Room 314, Illini Union Building July 11, 12, 13 — 1944

#### July 11 Morning Session

Presiding—Neil F. Garvey, Visual Aids Service, Division of University Extension, University of Illinois

9:30 Registration

Greetings — Robert B. Browne, Director, Summer Session, University of Illinois

"Place of Audio-Visual Aids in Our Educational Program"—E. H. Reeder, College of Education, University of Illinois

"Utilization of Still Pictures"—W. M. Johnson, University High School, University of Illinois

General Discussion led by H. J. Rucker, College of Agriculture, University of Illinois

#### Tuesday Afternoon Session

Presiding—Lee M. Morris, Principal, Elementary School, Rantoul, Illinois

"Selection of Projection Equipment"—Joseph E. Dickman, Acting Director, Science and Visual Instruction, Chicago Public Schools

General Discussion led by A. J. Ebel, Radio Station, University of Illinois

General Workshop in Problems of Projection—Maurice B. Evans and Albert W. Ginzbourger, Physical Plant Department, University of Illinois

#### July 12 Morning Session

Presiding—Clark E. Youmans, Principal, Township High School, Cerro Gordo, Illinois

"Role of Films in Adult Education"—L. C. Larsen, Bureau of Audio-Visual Aids, University of Indiana

General Discussion led by H. M. Hamlin, Agricultural Education, University of Illinois

"Utilization of Motion Pictures"—E. C. Waggoner, Director of Science and Visual Education, Public Schools, Elgin, Illinois

General Discussion led by Dorothy McGlynn, East St. Louis Schools

#### Wednesday Afternoon Session

Presiding—A. L. Thomasson, Principal, Junior High School, Champaign, Illinois

"Arrangements of Physical Facilities in School Buildings for the Use of Audio-Visual Aids"—Richard Edmondson, Assistant to the Superintendent of Public Instruction, Springfield, Illinois

General Discussion led by L. C. Larsen, University of Indiana

General Workshop in Problems of Equipment Maintenance—Maurice B. Evans, Albert W. Ginzbourger

(Concluded on page 257)

BUY MORE WAR BONDS

## Hundreds of RCA School Sound Systems now in use!

**G**OOD SCHOOLS of the future, public or private, cannot afford to be without a modern sound system. Successful experience in thousands of schools has already proved the value of such systems—many of which have now been in successful operation over a period of several years.

RCA School Sound Systems provide a simple means for quick, easy distribution of radio programs, phonograph recordings and on-the-scene vocals to any or all rooms of a school.

An RCA Sound System also serves as a communication center from which the School Administrator, his assistants or members of the faculty can effect instant contact with any or every part of the school. Obviously, such a system is extremely valuable for broadcasting instructions—especially in case of an emergency.

LISTEN TO "The Music America Loves Best" on the RCA program every Saturday, 7:30 p.m., E.W.T., Blue Network

Educational Dept. 61-7H  
RCA Victor Division, Radio Corporation of America

Will you please send me a copy of your booklet "Planning Tomorrow's Schools."

## High School Course in Audio-Visual Aids

BY CARL H. GARVIN

Director of Audio-Visual Aids, East Haven, Conn.

**A**N innovation in the field of audio-visual education was made this year at East Haven High School when a course in audio-visual education was offered to students in that school. This course carries a point credit toward graduation and will be of special and permanent value to students planning educational careers. The course has been very popular with the students and has gone a long way in solving service problems of a director who is not on a full time basis. Outline of the course is given below:

**Objective:** (1) To familiarize pupils with all audio-visual aids, equipment and their applications. (2) To have available to the school system at any time, capable operators of our audio-visual equipment. (3) To develop an appreciation of school equipment and its care, cost, and up-keep. (4) To develop responsibility, promptness and ability in arranging and carrying out programs for teachers and organizations in this town.

### Outline of Course

#### 1. Types of Audio-Visual Aids equipment and their use.

- (a) Class discussions on what comprises field of audio-visual aids.

#### 2. Motion Picture Projection (Sound and Silent)

- (a) Study of different makes of machines.  
(b) Types of films—(1) size, (2) sound and silent films, advantages and disadvantages, (3) technicolor and black-and-white films.  
(c) Construction of school machine, its operation and upkeep.  
(d) Care and repair of films.  
(e) Mechanics of how a film shows motion and sound.  
(f) Types of screens and lenses. (1) Working out distances on picture projection with different type lenses. (2) Study of light intensity.  
(g) Relationships of operator with audience.  
(h) Study of sources and availability of films.  
(i) How to order and arrange for programs.  
(j) Disposition and distribution of films for showing.  
(k) Keeping records. (1) Requisition sheets. (2) Summary of use of equipment, condition of equipment, title of films, running time, times shown, type of film, size of audience. (3) How to make an annual report covering year's work, what was done, future needs, plans and recommendations for following year.

- (l) The carrying through of a project for a teacher, school or department, involving the following:  
(1) Selecting film to correlate with a definite project in class. (2) Ordering film and setting up dates. (3) Running off program for teacher. (4) Making report on film and giving results to Visual-Aids class. (Any difficulties encountered as broken films, burned-out bulbs, poor sound, lighting, etc. are reported to class and discussed)

*Note*—After pupils are able to run the machines and arrange for programs, all requisition forms sent in by teachers are shown to class. All correspondence, film bulletins and new film releases are currently presented to class. A chart showing all films on order and who

is responsible for projection is posted on bulletin board. Also, as occasion demands, previews are made of films in class before they are shown to various groups.

#### 3. Film Strip Projection

- (a) Construction of machine, its care and up-keep. (b) Mechanics of operation. (c) Types of film strips and how they may be used. (d) Study of sources of material and of characteristic film strips on hand. (e) The carrying through of a project for a teacher, school or department (same as for the motion picture) (f) Discussion of value of this type of projection.

#### 4. Slide Projection

- (a) Construction of machine, its care and up-keep. (b) Mechanics of operation. (c) The making of glass slides for projection, in ink, crayon, colors, silhouette, carbon. (d) Slides available in school and outside sources. (e) The making of a series of slides for a teacher, e. g. silhouettes of planes for aviation course.

#### 5. The Recordio

- (a) Value of this machine and how it may be used. (1) Recording radio programs. (2) Recording school and class projects. (3) Uses as a public address system in speech classes.  
(b) Operation of this machine for all its uses.  
(c) Cutting a record of some school project (music organization, English Department, speech classes, etc.) and playing before class. (Class to rate clarity of record and value of project as a teaching device)

#### 6. Dioramas

- (a) Discussion of dioramas and how they are constructed. (b) Discussion of possible topics and how they could be used. (c) The making of a diorama for a teacher or department.

#### 7. Bulletin Boards

- (a) Value of bulletin boards and how they may be used for instruction. (b) Study of bulletin boards in our system, how they are used, and possibilities of improvement. (c) If arrangements can be made with a typical bulletin board as a teaching device.

#### 8. Additional Instruction on various types of well known movie projectors, instruction to be given on each to familiarize pupils with all types of machines.

If any teacher or department wishes projection material, pupils are assigned to work with the teacher. The pupils know the catalogued material and can present this to the teacher for selection. The class also handles all previews of films which are to be shown in the school system. Many of the films are recalls to be used for review work. If it is a new release, with which the instructor is not familiar, a preview is made in class. This is interesting work to the class and they try to determine where it could be used for a project in another group. It is up to the class to contact the department head and give a summary of the contents of film. If suitable the pupil makes arrangements with the instructor for a future showing.

The Recordio is delicate to operate in cutting records of good clarity. It would be difficult to find time to train enough teachers for an extensive use of this machine. The class works with any teacher or department in the making of any record pertaining to school work. Occasionally the Recordio is asked

**"WHICH SCREEN MOUNTING Should We Buy?"**

*Ask Your DA-LITE Visual Education DEALER!*

**DA-LITE MODEL B**  
hanging screen with case

**DA-LITE CHALLENGER**  
is the only screen that can be adjusted in height without separate adjustments of the case or fabric. Its exclusive inner-lifting device raises the case, roller and fully opened screen as one unit.

**Quality Screens for 34 Years**

He is an authority on good projection. He can help you choose quickly the right Da-Lite screen surface, style of mounting, and size for any projection requirement. Da-Lite Screens have been used by schools since they first began to teach with visual aids.

Reg. U.S. Pat. Off.

for by Civic organizations to be used as a public address system. This is also handled by the class.

This group has solved many of the problems confronting an Audio-Visual Aids director in a small school system where he is a full time teacher, devoting only part of his free time to a department of this kind. By having a trained group meeting regularly every day, many of the problems can be discussed, solved and assignments made, thus saving time and extra work on the director's part.

This class has solved our school problem of machine operation. The teacher has a schedule of all their classes and free periods so he can arrange for operators at any time during the day. As requests come in, the teacher discusses what is needed, pupils are scheduled for the project, and it is up to them to see that it is carried out. It has been very successful. All minor repairs are made by members of the class, such as cleaning and oiling machines, repairing cords, repairing films, and keeping the equipment in good running order.

They are all anxious to operate these machines, so they do their best. The machines are used in the town for civic organizations such as Red Cross, Churches, Air Wardens, etc. and the pupils do all the work of setting up and operating the machines. In this case the teacher asks for volunteers and sees to it that the equipment is transported to the desired location. There are always plenty of volunteers, and all members of the class may earn a chance to participate.

Projects of this kind make for a good relationship between the townspeople and the school, develops responsibility in the operator, and is good for the pupils in a social way in that he meets various types of people and has to overcome difficulties on his own.

▲ ▲  
A program demonstrating the potentialities of radio as a supplement to regular classroom studies was presented to principals and superintendents of Connecticut schools by the Connecticut Audio-Visual Education Association at New Britain State Teachers College on April 19. The meeting was held in the college auditorium and the stage was divided into two sec-

tions. On one half of the stage a demonstration of an education broadcast, dealing with the problems of the American Negro, was staged by Station WTIC. A classroom of 16 high school students was in session on the other half of the stage. The students could not see the performers but heard the demonstration as though it were an actual broadcast. Following the broadcast demonstration, the students carried on a discussion under the direction of their teacher Miss Dorothy Shapleigh.

Juano Hernandez, a well-known Negro actor, came to New Britain to play the leading role of Sam, a freed Negro.

Sterling Fisher, director of the NBC Inter-American University of the Air, and Assistant Public Service Counselor, spoke at the meeting. After the demonstration he conferred with a committee appointed by Dr. Alonzo G. Grace, commissioner of education, to discuss the possibilities of utilizing the NBC University of the Air's program as credit toward certification procedure or for teacher's improvement in the state.

## Film Story of Boston University

ONE of the outstanding public relations films available at the present time is *Thirty Minutes of University Life*, the scenes of which are laid in the six undergraduate colleges and the six graduate schools that comprise Boston University. The film, in 16mm kodachrome, consumes about forty minutes of running time.

President Marsh of Boston University, the narrator of the film, introduces the university to the film audience in the opening sequence. In the College of Business Administration the journalism students are seen in the *Boston University News* office. This is followed by shots of the university radio studio, advertising and merchandising classes; accounting groups; and industrial management courses. After a visit to the library and the student employment office, the war-time personnel department is inspected.

Students are shown in the officers' training program: first, enrolling in the program by means of interviews and examinations; and secondly, receiving instruction in the use of military equipment.

Boston University's physical education program is shown in one section of the film which includes shots of special classes for physical education teachers; gymnasium work; boxing classes; wrestling; rowing; tennis; canoeing; swimming; diving; and speed ball.

After the presentation of scenes of dormitory life, the film shows nurses in training. Representing the educational department of the university by scenes of students doing practice teaching and having interviews with a superintendent of schools, the production gives a comprehensive picture of the College of Music with its classroom activities, its orchestra, its choruses, and its seminary singers.

Several shots of the physics laboratories, including one of the testing of a motor; five shots of the chemistry laboratory; a demonstration and a visit to the observatory of the astronomy department; demonstrations of illusions, a color blind test, and a mechanical aptitude test in the psychology classes; and the study of the frog in biology, all illustrate the scientific facilities of the institution.

The Boston University Medical School, the School of Law, and the Secretarial School are then presented briefly. The Arts and Crafts division of the University follows with its life classes, clothing and sewing instruction, and nutrition study.

The concluding section of the film shows a number of events of especial interest to alumni of the school. The May Day celebration with its colorful procession, its pageant, and its folk dancing; the football games; the Student Council dinner at the President's home; and Alumni Day will certainly revive the memories of former graduates and students.

The film was produced by Floyd Ramsdell, president of the Worcester Film Corporation, under the super-

*With a question box on the making of school film productions, conducted by*

 Evander Childs High School, New York City

vision of the Director of School and College Relations. Professors of the university acted as technical advisors. For musical background, sound recordings of the University Orchestra, directed by Arthur Fielder, the chorus, glee club, and the University Band were used.

Judson Rea Butler, Director of School and College Relations, provided the material upon which the above film description was based. To secure the film for showing, address him at The Committee on School and Public Relations Office, Boston University, 20 Beacon Street, Boston, Massachusetts.

## QUESTION BOX ON SCHOOL FILM PRODUCTION

**Question:** Upon examining some of my recently returned films I find quite a few scenes covered with a kind of haze. Offhand I don't recall having filmed any of these pictures in hazy weather. Please explain.

**Answer:** Judging from your description, many of your hazy scenes are probably distant shots of landscapes, hills or valleys. You will recall from your elementary science experiments the one in which a pitcher of ice was placed on the table, and a minute or two later you observed the outside of the pitcher beginning to "sweat." This "sweat," you remember, did not come from the ice or water in the pitcher, but rather from the air surrounding the container. This experiment—the condensation of moisture of the air—made visible the water vapor always present in the air, but which we could not see unless we cooled the air, as in this demonstration.

Whenever minute droplets of water vapor settle on particles of dust or ions of gases present in air, they begin to scatter light—especially the bluish part. This phenomenon is called haze. (Mist or fog is not haze. Mist and fog are white; they are composed of larger water droplets.) The reason we don't often see haze is because our eyes are not very sensitive to the bluish-violet rays. The film in your camera, on the other hand, being very sensitive to blue light, registers it to the detriment of your picture.

To avoid the appearance of haze you must use a haze-cutting filter, one that will bring out the sharp, crisp picture in your distant scenes. If you are filming in black and white, you must get a strong, clear yellow filter, such as the G filter. When you slip that yellow filter on to your regular lens, you must keep one thing in mind—and that is that the addition of any colored filter usually means diminution of light. Your yellow filter will absorb the blue-violet light, rendering it darker in the finished picture. To compensate for this loss of light you must, therefore, do one of two things—either increase the diaphragm opening one full stop (depending upon filter factor, supplied by the manufacturer) or decrease the speed of your motion picture camera. The latter is permissible only in shooting landscapes or slowly moving objects. Either of the two steps outlined brings more light to your film.

If you are filming with regular outdoor Kodachrome, you must use the special Kodachrome haze filter. This filter, being colorless, does not require any adjustment in light. In other words its filter factor is zero. Finally, if you are using Kodachrome A (the type used for indoor filming with artificial light) outdoors, you must remember to add that salmon-pink filter called the Type A Kodachrome filter for Daylight. With this filter on, your emulsion speed rating is Weston 8, the same as the regular Kodachrome. This filter serves a double purpose. It absorbs some of the blue from daylight and acts as a haze filter.

## A Monthly Digest

ETTA SCHNEIDER RESS, Editor  
New York University Film Library

### POSTWAR VISUAL EDUCATION

**A Map of Forces**—Donald Slesinger—*Film News* 5:4 April, 1944.

An examination of the objective, direction and magnitude of forces which must be taken into consideration, and the allocation of power, with respect to the use of films in education—a thought-provoking discussion of possible future developments in this field.

"The objective of the film in education must be the same as that of education in general, since the film is a method, not a goal." Current interest in extending the use of films in education, stimulated greatly by their successful use by the armed forces, is setting in motion forces, not all of which, the writer finds, are educational in direction.

One of these forces is the entertainment film industry, which scents a billion dollar market for educational film production. In addition to finance and equipment, the industry will contribute certain skills and habits. But the tendency of the entertainment-trained technician is to dramatize and glamourize. Another tendency the entertainment film industry may bring to education is that of censorship, and all that it implies. To make the most money, films must be seen by the largest possible audience, must be on a certain level, and must offend no one. It thus denies the uniqueness of each individual, which education does its best to preserve.

The industrial film industry, the small but growing educational film industry, and government production, are other forces surveyed. Many textbook publishers even are considering branching out into film production. However, the writer sees the documentary producer as education's greatest ally. "For he has an artistic integrity, . . . and accepts the psychology of individual difference. He has always tailor-made his films for very small audiences."

"Fortunately, education has the power it needs to make educational film production serve its ends. Besides integrity and experience it has enormous purchasing power, and can go into educational production, as well as distribution, on a large scale whenever industry fails it. There is nothing about the making of a film that educators cannot learn."

The article concludes with this statement as to the allocation of power—"Since the responsibility of developing the educational use of films lies with education, there must also lie the power. To keep it educators must be willing to cooperate, but prepared to fight."

**What Is the Objective?**—Floyd E. Brooker, U. S. Office of Education—*Film News* 5: 7 April, 1944.

The vast visual aid production, distribution, and utilization programs of the government since 1940 constitute one of the most amazing educational developments of the war but, in Mr. Brooker's opinion, the full implication of this war expansion has been too little explored and understood. Schools have not made the same progress in acceptance and application as have the Armed Forces and industrial plants. He warns educators that, although great progress has been made, the continued growth of visual education will be their responsibility, and they should start now to plan for the future. He indicates a few areas where planning is needed, in the form of questions, many of which require further research. He believes that we cannot hope for further progress in the acceptance and application of visual aids by schools until the objectives of visual education are better clarified than they are at present, and some action is taken to achieve those objectives. Another responsibility of visual educators, he affirms, is experimentation. The success of any visual aid depends upon effective utilization. This can be learned and shown quickest by objective reports from instructors in different teaching situations.

**Impact of GI Methods on Civilian Instruction**—D. S. Brainard, President, St. Cloud State Teachers College—*Minnesota Journal of Education* 24: 351 May, 1944.

Although full recognition is given to the success of the military training program and the marvelous educational job it has done, the conclusion reached by Mr. Brainard is that similar methods cannot be used permanently for the education of civilians. This fact becomes apparent from a study of the environment surrounding the educational courses offered by the army and by the navy. Furthermore, the military authorities possess almost unlimited funds. For example, few educational institutions possess the funds with which to carry on a visual education program on the scale employed by the armed forces. Another distinction between the military program and civilian education is to be found in the objectives. In the armed forces men are trained intensively in specific techniques in order to prepare them for special duties. "Education is more than the accumulation of knowledge, the mastering of techniques. It is a process of growth and development . . . is in itself a part of life. It is probably impossible to speed it up very much and perhaps undesirable as well."

**Motion Pictures in the Schools of Tomorrow**—Frances Norene Ahl, Glendale (Calif.) High School—*The Social Studies* 35: 166 April, 1944.

The author foresees a tremendous increase in the use and availability of educational films in the schools of tomorrow as a by-product of the use of films in the training program of our armed services and industry. Not only does she anticipate better films more suited to classroom needs, at reduced rentals, but better methods of utilizing them in order to obtain the maximum instructional values from them. Administrators and teachers are urged to be prepared for the greatly expanded program to come. Provision should be made for adequate financial support, trained leadership, and time for research to keep abreast of materials and methods.

### UTILIZATION

**Visual Education Number**—F. Dean McClusky, Editor—*Education* 64: 401-446 March, 1944. 50c per copy.

This special issue provides a wealth of ideas for the enrichment and increased effectiveness of geography teaching. In his introductory editorial on "Visual Instruction and the Teaching of Geography," Mr. McClusky states that the issue has been designed to emphasize the contribution which visual instruction is making to the teaching of geography. It also points to the future by indicating how visual techniques can implement the extension of our geographical knowledge. The contributors of the articles were selected with a view to showing how the several types of visual aids may be effectively employed.

"The Motion Picture in Teaching World Geography" is discussed by Wallace W. Atwood, Director of the Clark University Graduate School of Geography. He points out that no subject in the entire curriculum needs the modern sound-motion picture as does geography, which deals with the world at work and the adjustments people make to their environments. The motion picture brings a vivid picture of far-away lands and peoples by reproducing the motion, changes, actions and natural sounds that characterize the various scenes.

"The Motion Picture and World Understanding," by Herbert S. Houston, formerly publisher of *The World's Work*, refers to the David Starr Jordan plan for using educational films in the schools of the world to promote peace, which was adopted in 1937 by the World Federation of Education Associations and stands ready to be put into action after the war.

In the intervening seven years, the writer declares that remarkable progress has been made in all countries in the field of visual education, much of which is due to the present training program of governments. The visual aids program of our own government agencies indicates that visual education is coming into its rightful place as a great agency of instruction. Various movements are now taking form for the production and distribution of educational motion pictures after the war as the most effective means of building understanding and peace in the world.

Other articles in this issue which offer further valuable teaching suggestions are: "Air World Geography," by N. L. Engelhardt, Jr.; "Today's Geography in a Museum," by Grace Fisher Ramsey; "Visual Materials Vitalize Geography," by Kathryn Schmorrenberg; "The Use of Visual Aids in Teaching Elementary Geography," by Lucile Allard; "Pictures as Laboratory Material in Geography," by Edith P. Parker; "Pictures in Geography Teaching," by E. Winifred Crawford; and a "Symposium of Visualized Geography Lessons," by Adelbert K. Botts, Margaret S. Chew and Viola Cassidy.

**Visually Speaking**—Del Shelley, Director Audio-Visual Instruction, Mesa Public Schools—*Arizona Teacher-Parent* 32:16 Spring Issue, 1944.

One of the educational problems in Arizona is to develop a program of instruction that makes learning experiences easier and more meaningful for Spanish-American children, many of whom are without the simplest English vocabulary. Audio-visual aids bring to these handicapped children carefully planned and directed hearing and seeing experiences which influence the setting of standards, development of individual initiative and self-confidence and establish a background for language, reading, spelling and number work. Best results in visual-sensory methods are had when the teacher varies her procedure to meet the problems and needs of the class.

**How to Use Audio-Visual Aids—Part 4. Competent Operators Are Made, Not Born**—Elizabeth Goudy and Lt. Francis W. Noel, USNR—*The Business Education World* 24: 384 March, 1944.

Women teachers should not doubt their ability to master the mechanical aspects of audio-visual equipment. Wartime experience belies the traditional supremacy of men in things mechanical. The article suggests some procedures in learning to operate projectors, which will definitely make for teacher ease in handling the equipment and help develop assurance. Besides acquiring skill in the operation of equipment, other factors must be carefully considered, such as darkening, ventilation, proper placing of screen and seating of students. Even though the writers recommend that teachers know how to operate and care for equipment, they feel that students should be trained to do this work, the teacher only taking over in an emergency.

### TELEVISION AND RADIO

**Television, Challenge to Education**—Leonard Power—(paper copyrighted by The Grolier Society)—*Virginia Journal of Education* 37:257 March, 1944.

The educational effectiveness of television has already been demonstrated by its use in the training of air-raid wardens and Red Cross workers. A few children also have been given the opportunity to enjoy television field trips to museums, zoos and parks. "In the post-war classroom, television is destined to exert a far greater influence in widening the sphere of human knowledge than either radio or the motion picture. The unique and distinguishing feature of television is its power to combine the best of both of these mediums plus the addition of a completely new thing in the world: the ability to bring the whole world, eventually, within the short focus of the human eye." Technically, television is ready to go into action after the war, and educators should get ready to meet this latest challenge. Already a few universities have established experimental stations. Mr. Power foresees the production of television programs, geared to school needs, by local boards of education operating their own stations, as some cities are now doing with radio.

# FILMATIC

## TRIPLE-PURPOSE FILM-SLIDE PROJECTOR

**GoldE**

MOTOR DRIVEN  
FORCED AIR-COOLED

NO REWINDING  
NECESSARY

FINEST LENS  
OF ITS TYPE

**3-WAY USE**

- 2 x 2 Paper or Glass Slides
- Single Frame Slidefilm
- Double Frame Slidefilm

**Instantly Set up**

**Corrected Lens—Can Be Cleaned Easily**

**Film Loops Naturally ... Will Not Scratch**

**Conveniently Portable —Yet Very Stable**

It's easier, more economical to use this versatile 3-in-1 projector. Gives more illumination per watt—assures perfect clarity of image. Can be changed from film to slide showing—in a jiffy! Modern design. Has Manumatic slide carrier—Kwik-Lok spiral focusing—smooth tilting—fingertip control—accurately centered optical system. 300 watt lamp capacity. Complete with custom-built carrying case.

# AIR-FLO STEREOPTON

**GoldE**

FOR LONGER DISTANCES

FOR COOLER OPERATION

LAMP CAPACITY UP TO 1000 WATTS

**Forced-Air Cooled**

**Adjustable Bellows**

**Built-in Tilting Device**

**All-Steel-Welded Construction**

Another GoldE advancement in stereopticon design! This modern, trouble-free Stereopton withstands constant operation—heat absorption filter gives slides added protection from heat damage. Precision optical system uses the finest ground and polished lens. (Choice of 3, from wide range). Shows standard 3 1/4" x 4" slides. Compact—conveniently portable.

**GoldE Manufacturing Co.**  
 1220 W. MADISON ST., DEPT. C., CHICAGO 7, U.S.A.  
 Designers and Manufacturers of Light Projection Equipment

**Audio Aids Are Essential**—Wallace L. Garneau, Western Michigan College, Kalamazoo—*Michigan Education Journal* 21: 410 April, 1944.

"Radio and recordings are just as essential as other aids," declares the writer, "and educational administrators are becoming more and more aware of the fact." He expects recordings to make a tremendous advance as an educational tool after the war. Teachers offer many reasons for neglecting the use of radio and recordings—lack of equipment, objection to advertising in programs, the ironclad time schedule of both commercial radio stations and educational institutions, and lack of training in the use of radio as a teaching aid. The article meets these objections with helpful suggestions, and recommends more teaching demonstrations of the use of these tools on educational programs.

#### SCHOOL EXCURSIONS

**Science Excursions into the Community**—A Handbook for Teachers of Grades Four through Eight, by George E. Pitluga. New York, Bureau of Publications, Teachers College, Columbia University, 1943. 154 p. \$1.75.

Offers guidance in the use of the field trip as a teaching technique and includes information and suggestions on how some excursions may be carried out. It is primarily concerned with the science aspects of community experience, but it may also be used in the social studies to enrich group activities.

#### Motion Pictures in a Modern High School

(Concluded from page 242)

Perhaps the vehicle that has stimulated the greatest utilization of motion pictures is our film card catalog. Each department head has available in a special film file a 4 x 6 card of all films for each subject in his department. Each card gives full data on the film, including a short synopsis and a teacher evaluation. These files are continually being added to so that at all times they are nearly up to date. The use made of this card catalog is reflected in the constantly increasing demand for film. Department heads appoint teacher committees to draw up schedules for each subject. These are then sent to the director of visual aids. The director arranges for all booking with distributors, arranges for payment, receives and returns all shipments, arranges for rooms in which the program is to be shown, cares for all equipment, and provides operators; in fact, he leaves to the class teachers only the problem of providing the class and teaching it. This coordination between class teacher, department head and the director of visual aids has led to a harmonious relationship, and a wider use of film programs at the time when class teachers can best utilize the films.

At John Hay High School, the motion picture film has become undoubtedly the most effective tool in education to convey human experiences, create attitudes, and tell its story in the most convincing and lifelike manner. When properly projected, the motion picture gives every member of the audience a front seat from which to view an event. The recent development of sound motion pictures, with their carefully edited and prepared lecture, are preferred over silent films because they give the student a simultaneous reception of multi-sensations which tend to increase his illusion of reality and stimulate his emotional responses. When one considers, then, the triple role motion pictures must fulfill in our school program, and the fact that our motion picture program plays such a vital part at John Hay, one realizes what efforts are put forth each semester to secure the hundreds of films needed, and why no expense can be spared.

## Experimental Research in Audio-Visual Education

DAVID GOODMAN, Ph.D. Editor

### SOUND PATHS TO LEARNING

A Comparison of Three Classroom Methods of Using Educational Sound Films

Investigator: WALTER ARNO WITTICH

Abstract of Doctor's Thesis, University of Wisconsin, 1943.  
Purpose

This study compared three methods of classroom use of educational sound films to discover:

1. Which of three teaching methods used in showing 27 educational sound moving pictures results in the greatest acquisition of factual knowledge and social understanding.
2. To what extent intelligence and reading ability influence the child's ability to gain information from educational sound films.

#### Procedure

The three sound-film teaching procedures followed were:

1. A situation in which the child viewed the film after having anticipated the showing of the film only in the course of casual and unorganized classroom work, and immediately responded to a 50-item test.
2. A situation in which the child read a brief story-like "setting" of the general nature of the film, studied words and phrases necessary to understand the sound track of the film, read questions which anticipated the large areas of information in the film, viewed the film, and immediately responded to a 50-item test.
3. A situation which included all of "2" above and added, 24 hours later; oral discussion of a pre-arranged set of discussion questions based on the film, re-screening the film, and immediate response to the same test a second time.

The above are referred to as Experimental Factors 1, 2, and 3. Twenty-seven educational sound pictures were used. Nine Erpi films were used at each of grade-levels 4, 5, and 6. The films were selected on the basis of the social studies and natural science units being studied in the course of normal work in Grades 4, 5, and 6. Every effort was made to have children retain normal class work. The introduction of the audio-visual materials was treated as an added supplement of information to normal classroom routine.

The experiment began the first week in October, 1942, and continued until the first week in June, 1943. Representing Grades 4, 5, and 6 quite equally, 264 children participated. In intelligence, the distribution was skewed slightly to the right. Reading ability was typical. The rotating group method was used so as to remove influences other than those brought about by the application of the Experimental Factors 1, 2, and 3.

The average time spent by groups working under Experimental Factor 1 was 35 minutes per film; under Experimental Factor 2, 45 minutes; and under Experimental Factor 3, 90 minutes. Groups came by classes to the auditorium to discuss and view the films. They returned immediately to their classrooms to take the tests. Nine class groups of children, three groups per grade, viewed nine films at each grade-level. Each group rotated itself through the three experimental factors three times while viewing nine films. Four-page Learning Guides were constructed so that the Experiment Factors 1, 2, and 3 could be held more constant. The format of all learning guides was uniform.

Final results were based on test scores earned on the 27 film tests. Differences between class averages made on Experimental Factors 1, 2 and 3 were computed. Standard units of error or critical ratios were also computed, and correlation between test scores and reading grade and between intelligence and read-

ing grade were computed. Subjective records of student comment and reactions were kept during the course of the experiment.

### Conclusions

The conclusions based on statistical analysis and subjective pupil comment are as follows:

1. In almost every case and for each of the three grades, the level of performance attained through the method of presentation indicated as Experimental Factor 3 during Rotation 3 reveals improvements in performance which are virtually double those attained through the classroom use described in Experimental Factor 1.

2. In every case, substantial gains are shown in the levels of performance attained through the use of Experimental Factors 1, 2, and 3, and in every case, these gains are statistically significant. However, even during the closing weeks of the experiment, levels of achievement were not gained which indicated complete mastery of the content of the educational sound films used.

3. In the third rotation for all grades, Experimental Factor 2, which may be called 50% anticipation, shows gains which are very close to 50% of improvement. Likewise Experimental Factor 3, which may be called more complete or 100% anticipation of the film, causes gains to occur which represent virtually 100% improvement over the levels achieved in Experimental Factor 1.

4. Through the use of Experimental Factors 2 and 3, children become increasingly able observers; that is, as evidenced by test results, they increase their ability to observe factual information and they increase their ability to use this factual information in answering test questions which probe ability to make social judgments not specifically identified with the film itself or with the sound track.

5. The more difficult the film, the more effective becomes anticipation as provided for under Experimental Factors 2 and 3.

6. Children of low I.Q. and high I.Q. seem to be motivated similarly and learn comparable increasing amounts of information from educational sound films.

7. Correlation does exist between reading grade and level of performance as measured by the pupils' reactions to the experimental factor tests. The correlations vary widely from 1% to 79%. Correlations between reading grade and performance on film tests tend to decrease as the grade increases. As the difficulty of the film increases, the correlation tends to decrease.

8. Experimental Factors 2 and 3 tend to produce an increased homogeneity of performance among the nine classes participating.

9. An analysis of pupil responses shows that children's interest in films concerns how other people live, their dress, and social customs; how other people work; and how children of other lands work, play and get an education.

10. Pupil comment reveals satisfaction at the clarity, vividness, and speed with which the film portrayed other lands, other periods in history, wild life, vocational pursuits, etc.

11. Children were of the opinion that they not only like to learn through the motion picture but that learning with the assistance of the film is made more interesting, easier, and more lasting when the Learning Guides are used.

12. Subjective evidence in the form of pupil response and objective evidence in the form of the statistical analysis of the scores earned under learning conditions set by Experimental Factors 1, 2, and 3, all attest to the worth of using adequate anticipatory teaching techniques with educational sound motion pictures.

Indiana University, Bloomington

### The Slide Rule (The "C" and "D" Scales)

(Castle Films Inc., R. C. A. Building, New York) 24 minutes, 16mm. sound. Purchase price \$30.67. (Coordinated filmstrip \$1). Produced by U. S. Office of Education, Division of Visual Aids, and Loucks and Norling Studios, New York. Apply to distributor for rental sources.

Explains in detail the C and D scales of the slide rule, the parts and markings of the rule, and shows how to use these scales for multiplication, division, and combinations of multiplication and division.

In the introduction an engineer is shown using a slide rule to solve mathematical problems quickly. The commentator explains that the accuracy with which the slide rule solves problems is adequate for most engineering problems. The lines of marks and numbers known as the C and D scales are shown, and it is explained that these two scales are used principally for multiplication and division. The C scale slides back and forth on the D scale which is the body of the rule. The extremity to the right of the user is known as the right index and the extremity to the left is known as the left index. The hair line or runner which is called the indicator assists in reading the rule.

To introduce the process of multiplication the rule is simplified by removing the indicator and small lines; only the ten main divisions are left on each scale. Several multiplication problems are worked demonstrating that the index on the C scale is set opposite the multiplier on the D scale and that the answer may be read on the D scale under the multiplicand. Animated charts demonstrate that ciphers and decimal points may be read in mentally. At this point the secondary and tertiary subdivisions are added, and there are demonstrations in reading numbers. The sequence ends with demonstrations of multiplication problems using the full scale.

The second sequence shows that division by means of the slide rule is a matter of locating the dividend on the D scale and moving it to the division on the C scale, then moving the indicator to the index and reading the answer under it on the D scale. Just as in multiplication, it is also shown here that ciphers and decimal points may be added mentally.

The final sequence demonstrates that a problem involving both multiplication and division may be solved by one

setting of the rule and that it is not necessary to read the intermediate answer. The commentator concludes by stating that even though the rule is ordinarily used for solving more complicated problems than those demonstrated in the film, nevertheless the principles are the same and that speed in using the rule will come with practice.

**Committee Appraisal:** The film should be a useful tool in introducing the slide rule to a beginner. It is an advantage to have the subdivisions removed and only the ten main divisions of the two scales left; then later the subdivisions added to the scales. Close-up photography and animations contribute much to an explanation of the use of the slide rule. The film should be helpful to instructors teaching the use of the C and D scales to math classes in school or to adult groups in industry. The committee emphasized the importance of supplementing the film with handling and using actual slide rules.

### Psychiatry in Action

(British Information Services, 30 Rockefeller Plaza, New York, and Educational Film Library Association, 45 Rockefeller Plaza, New York). 60 minutes, 16mm. sound. Purchase price \$67.50. Produced by the British Ministry of Information. Apply to distributors for rental sources.

Depicts the wartime organization and psychiatric techniques employed in one of Britain's seven large neurosis centers. Its aim is the rapid rehabilitation of neurotics who have broken down under the stress of war conditions.

Opening scenes show the extensive hospital buildings and facilities. Upon arrival, all patients spend the first twenty-four hours in the Admission House. They fill out questionnaires on hobbies and interests, undergo physical examinations and are interviewed as to their educational, employment, and service records. After performing psychological tests, each patient is transferred to the hospital unit and physician especially suited to his needs.

Doctor-patient interviews provide the foundation for treatment. Additional information is secured through psychometric testing, in which doctors and psychologists work in close rapport. Patients are shown taking Wechsler-Bellevue and Rorschach tests and a new type of suggestion test developed at the center. They are also scored with Koh's Blocks, the Minnesota Form Board, the Karl Hollow Square, and the Triple Tester. The special treatments employed at the hospital are pictured in detail. The camera records therapy by continuous narcosis, the modified insulin treatment, and electric convulsions. The use of narco-analysis is demonstrated as it relieves hysterical muscular tremors.

Carefully planned and supervised remedial training both—recreational and occupational—forms an important part of the general treatment and rehabilitation of patients. Scenes of an army officer and a physician discussing the disposal of military personnel and an interview between a Ministry of Labour official and a discharged veteran illustrate the extreme care taken in this matter. The film closes with reference to the valuable role of the neurosis centers both in rehabilitating men and women and in enabling them to play a more constructive part in the national war effort.

This monthly page of reviews is conducted for the benefit of educational film producers and users alike. The comments and criticisms of both are cordially invited.

Producers wishing to have new films reviewed on this page should write L. C. Larson, Indiana University, Bloomington, Indiana, giving details as to length, content, date on which the film was issued, basis of availability, prices, producer and distributor. They will be informed of the first open date when the Teacher Committee will review the films. The only cost to producers for the service is the cost of transporting the prints to and from Bloomington. *This Cost Must Be Borne By The Producers.*

**Committee Appraisal:** Although this is a technical film, the subject is presented in such a lucid manner that it can easily be followed and understood even by a beginner in any of the many professions shown at work in the film—medicine, psychology, psychiatric nursing, neuropsychiatry, social work, occupational therapy, and administration of hospitals. The film will be useful to show staffs organizing similar hospital units in the United States for the purpose of giving each staff member a picture of his particular responsibility as it relates to those of other members. Also useful for showing to the civilian population to prepare them for the return of war casualties and to give them confidence in the ability of hospitals to rehabilitate war veterans.

### The Invaluable Ingredient

(Leslie Salt Co., 2116 Sacramento Street, Los Angeles, California). 22 minutes, 16mm. sound. Produced by Photo and Sound Incorporated. Apply to distributor for free rental.

The turning of illuminated pages of a fable show an impoverished aged man being received as guest by a king who orders for him a sumptuous, but saltless, feast. The old man, hungry as he is, cannot relish the food. He relates to the king the story of how he, as a king, years ago, divided his kingdom between his two astute and flattering sons and denied a share to his third son who had said, "I love my king, Sire, as much as I love salt." Salt is then handed to the old man by the king—and the scene shifts from the subjects of the fable of salt to scenes of the ocean beating on rocks.

The salt water is shown impounded in large ponds where the sun shines and the wind blows on it. In smaller ponds the evaporation is shown by the formation of crystals. The crystals are harvested and sent by train to the refinery. The method of handling salt from the crude crystals to the finished package, is pictured with diagrams with conveyor belts, washers, dryers, grinders, magnets, screeners and packagers.

As the commentator stresses the absolute necessity for salt in both human and animal diet the scene shifts back to the old man and the king on the pages of the fable showing that when salt was added the food was palatable. The mendicant now realizes that this benign king is his youngest son who now offers to share his throne and kingdom with his father.

**Committee Appraisal:** Even though directed primarily to school children the film should be interesting to adults who enjoy the touch of fantasy. The use of the fable concerning salt and its importance to life contributes to the romantic treatment of a trip through a factory where the majority of the operations are carried on inside closed machines. Will correlate with work in art, costume designing, creative dramatics, and industrial geography.

### Gaspe Cod Fishermen

(National Film Board of Canada, 84 East Randolph Street, Chicago). 11 minutes, 16mm. sound. Purchase price, \$15. Apply to distributor for rental.

To orientate the audience geographically a black and white map of Canada designating the peninsula of Gaspe is presented. While the map and scenes of the shore line, fishing boats in harbors, and men at work on nets are shown, the commentator summarizes the history of the peninsula which was originally settled by the Irish and the French. Since the first, cod fishing has been the chief industry.

The film portrays the usual day in the lives of these cod fishermen; men are shown hauling in the filled nets before dawn, cutting bait, and setting sail for the day's work. Close-ups of the men managing the sail boats, letting out the nets, and hauling in the fish highlight the chief phases of the actual catch.

The less romantic aspects of cod fishing are shown as the men remove the fish from the boats and clean and prepare them for the market. All these operations—fishing, dressing, and marketing—are done on a cooperative basis as explained by the commentator. At the end of the season each man receives his share of the profits.

Following the cleaning and weighing of the fish, the film briefs the four methods commonly used in the preparation of the fish for market. Women are shown packing the fresh filets in boxes which are shipped by modern refrigeration methods. Other scenes illustrate the methods by which the cod is smoked, salted, or dried. Much of the work is done in the open along the shore.

The closing sequence of the film stresses the cooperative effort of the fishermen. Men are shown settling their accounts and receiving their share of the profits, purchasing new equipment for the coming season, and investing surplus money in other interests. The democratic features of the cooperative plan are depicted as the men are pictured in a community meeting, each giving his opinion regarding plans for their common industry. The film ends with scenes of the harbor at twilight.

**Committee Appraisal:** Interestingly presented, clearly photographed, and sincerely presented, the film presents a realistic picture of the life and work of Gaspe cod fishermen. Should be useful to groups discussing cooperatives, the geography of Gaspe, ways of making a living, or means of preserving meats.

### Student Participation in a Guidance Program

(Concluded from page 247)

speakers because it gives them a sense of belonging to the school and a feeling of doing something worthwhile for their school.

English and social living classes have had the opportunity to explore and report their findings of interesting material within the junior high school itself. Some of the chosen topics include the boiler room, the kitchen, the public address system, the machinery about the school, and the electric clock and bell system. The students choose appropriate slides to illustrate their oral reports.

**What equipment is used to show these slides?** Dana Junior High School in addition to fine radio and motion picture equipment, has two 300 watt S.V.E. 35mm projectors that accommodate both filmstrips and slides. We have three portable beaded screens with boxed hoods that work very well in a semi-darkened classroom. We also have a few individual 35mm film viewers that are used by students who have been absent or tardy. This eliminates repeating material to the whole class just to accommodate a few.

**What value is there in student participation in a visual education project?** Students are given a chance to express themselves in action or voice to their own kind. The camera, the picture, and the microphone all have a definite challenge and appeal and actually invite participation. The student gains confidence and poise from his projected partner when delivering his illustrated talk.

This program proved conclusively that student interest is aroused and held and retention of subject matter enhanced by the use of the slide. Not only was it a teaching aid but it became an integral part of Dana Junior High School's educational program.

## 16mm Films to Aid Fifth War Loan Drive

The U. S. Treasury Department for the first time has agreed to use the 16mm film media officially. All 16mm film workers are asked to take an active part in the Fifth War Loan Drive, June 12-July 8, in accordance with the recommendations of the OWI Advisory and Policy Committee. The Treasury has supplied OWI distributors with 250 prints each of three new one-reel War Department combat films, never before released, for the widest possible circulation. These are:

*Report from the Beachhead* (10 min.)—a stirring film showing the established beachhead at Anzio, and the hardships endured.

*What Makes a Battle* (14 min.)—proving that it takes a masterpiece of strategy to get supplies and human power coordinated when forces of land, sea, and air unite in striking for victory.

*Reports from the AAF* (9 min.)—includes a report from Britain showing the RAF and the 8th Air Force on a hedgehopping bomber flight over France and Germany, and the 5th Air Force report from New Guinea.

A war bond trailer on the part all Americans must play in backing the attack, will also be supplied to attach to war films during the drive. After July 8 these trailers will be removed and the three films will be regular OWI subjects. These special War Department films will be supplied free for War Bond Rallies through July 8, after which they will be listed at the regular OWI service charge.

Every national association interested in 16mm film distribution, and all national civic organizations are requested to urge their local organizations to give the Treasury their full support in this great financial effort.

## Filmstrips for Latin American Schools

The American Council on Education, 744 Jackson Place, Washington, D. C., is the sponsor of a filmstrip project on aspects of life in the United States, which is to be distributed to Latin America for use in schools. Thirty-five filmstrips have been completed in this project, which is under the direction of Milton R. Tinsley, and the program has been extended to include forty additional subjects. The first seven subjects are general, dealing with the country as a whole or large regions. The others present narrower fields of interest, such as nutrition, soil conservation, rural public health, one-teacher school, railroad transportation, etc.

There are approximately fifty pictures under each title. Each filmstrip is accompanied by a narration to be read aloud with the pictures, and a pamphlet of suggestions and additional information for teachers. A great deal of care has gone into the selection of the pictures and the writing of the narrations. The aim has been to make them intimate and authentic pictures of everyday life and problems.

Although this material was prepared specifically for use in the other American republics, the American Council has made plans for distribution in this country also, in response to the widespread demand for them.

# NOTES

## Donald Bean Appointed NAVED Consultant

The National Association of Visual Education Dealers announces the appointment of Donald Bean as Educational Consultant. Mr. Bean has been connected with various visual education projects in the past. He was Manager of the University of Chicago Press when the first Erpi-Chicago pictures were produced and planned their original distribution program. Eastman's Kodachrome film, "Eighteenth Century Life in Colonial Williamsburg" was made under his direction.

The Postwar Platform for Educational Dealers adopted at the March meeting of the Board of Directors, was prepared in consultation with Mr. Bean. Its ten forward-looking planks include a code of ethics for the industry, training of men now in service for employment in the industry after the war, emphasis on mechanical service, teacher training, and recognition of superior teaching procedures through NAVED Visual Education Awards. The Membership of Naved has more than doubled since the first of the year when the Board of Directors undertook a program of expansion in anticipation of the new emphasis on visual education in the post-war period. The members now total more than 200 prominent visual education dealers, individuals, and firms producing equipment and films for educational uses.

The New Educational Consultant will confer with dealers and educators on their visual educational problems and will assist in initiating the new post-war program, planning the annual convention, and editing NAVED News. His appointment is for six months. His office is located at 1219 Madison Avenue, Toledo 2, Ohio.

The Annual Meeting of NAVED announced for August 13 and 14 at the Palmer House in Chicago will be devoted entirely to the consideration of the important plans for the postwar period.

## C. A. Lindstrom Named USDA Motion Picture Chief

Appointment of Chester A. Lindstrom as chief of its Motion Picture Service is announced by the Department of Agriculture. Mr. Lindstrom, who has been associate chief of the Service, succeeds Raymond Evans, who retired recently.

Mr. Lindstrom, a native of Manchester, N. H., has been in motion picture work in the Department for more than 30 years. He began his motion picture career in connection with a travelogue made by Burton Holmes in the Philippines in 1912. He entered the service of the Department in 1913, serving successively in the Forest Service, the Office of Exhibits, and the Office of Motion Pictures. The new chief of the Motion Picture Service has been active in the field of visual education. He has contributed liberally to publications in the field, and has written, directed, and produced some fifty motion pictures in addition to supervising scores of others.

## ANFA WAR FILM CONFERENCE

A two-day conference on the use of 16mm. films in war and postwar service, held by the Allied Non-Theatrical Film Association, in New York April 28-29 marks a new high in the history of the ANFA organization, and in war time trade meetings generally. The organization now enrolls over 90 of the leading film sources, distributors, equipment manufacturers, service and publicity agencies. Each of these groups has an equal "say" in formulating and executing policies. Under the by-laws, industry, film sources and libraries are each represented on the Board of Directors. The new board consists of Horace Jones (Pres.), Samuel Goldstein (Vice Pres.), E. E. Carter (2nd Vice Pres.), W. F. Kruse (Sec'y), Geo. H. Cole (Treas.) and Stanley C. Atkinson, Tom Brandon, Harry Kapit and Clem Williams, directors, with past-presidents Bertram Wiloughby and William K. Hedwig, ex-officio.

The first session was taken up with officers reports and nominations, the second with a series of three papers: "Library Problems," by Russell C. Roshon, "Equipment and Accessory Routine," by Richard F. O'Neil, and "Postwar Problems," by W. F. Kruse. It was unanimously decided that the latter address be published in full, serially, in forthcoming issues of the ANFA Bulletin. The third session was an open forum on "The 16mm Industry in the War," with a lively discussion led by C. R. Reagan (OWI) and L. C. Larson (University of Indiana).

The fourth session was devoted chiefly to the discussion and adoption of resolutions. The heroism and devotion of industry members in the armed forces, and the effective, win-the-war activities of the retiring officers of ANFA were lauded. The resolution on the armed forces stated that "we pledge our utmost effort in every field that their sacrifices shall bring forth a better world," and a pledge to "these fighters (of) every possible preference upon their return to civilian life." Discussion centered upon such moot resolutions as:

- (1) That films be "truly and objectively described as to contents, quality and audience suitability, bearing due regard for the higher standards that must necessarily be applied in the non-theatrical field."
- (2) That improved services will ultimately be assured film consumers only when "competition is based on superior services, rather than on price cuts and other short range concessions."
- (3) That published catalog prices should represent actual charges, without subterfuge.
- (4) That discounts should be extended only to bona fide channels of distribution.
- (5) That all efforts to subject film rental services to sales taxes be opposed, where such taxes do not apply to other services involving no change in ownership of the item taxed.
- (6) That adequate supplies of 16mm. raw stock be allocated to enable the industry to continue its war services, out of the portion set aside for civilian use, and that the film needs of all governmental agencies involved in the war effort be met from film stocks reserved for war purposes.
- (7) That educational institutions engaged in pre-induction training and vocational education "receive preference ratings of AA-1 or AA-2 as warranted by their degree of essentiality in the war effort," when seeking to purchase 16mm. sound projectors and accessories.

## The Adventures of Mark Twain

HERE is a theatrical production that should win not only high success at the boxoffice but enthusiastic approval and support from the whole educational field. It not only brings to life for the rising generation a great American writer who died a generation ago, but will set a host of young and old to reading, or re-reading, the works of the ever beloved Mark Twain.

The schools will have no excuse for failure to get maximum educational values from this theatrical achievement. Warner Brothers' Educational Bureau has taken care to provide teachers with everything needed: (1) Three mimeo sheets give full technical data on the film, the elaborate cast of 119 names, and a finely detailed and complete synopsis of the picture contents; (2) A Discussion Guide (described below); (3) A Pictorial Map, as colorful as Mark Twain's career, visualizing events where they occurred in this country and abroad, the sequence shown by serial numbers as bewildering in their unpredictable jumps as the performance of his famous Jumping Frog. This map is an irresistible feature for the school Bulletin Board.

The Discussion Guide deserves particular comment. This fine bit of work moved our old friend, William F. Kruse, Manager Films Division, Bell and Howell Company, to a pitch of enthusiasm quite equal to our own—and we quote: "Unquestionably the picture is one of the finest contributions of the industry, and this Guide is, in my opinion, one of the best teaching tools yet developed for the difficult task of making a theatrical feature of true educational value.

"Willard Givens, in an excellent introduction, points out that its purpose is 'to give the teacher a dignified and useful instrument for correlating a good motion picture that is intrinsically educational with the study in the classroom'. The organization of the Discussion Guide is sound. It begins 'Using this Brochure' and continues with biographical notes, an appreciation by George Ade, significant details on the making of the picture, the social background of Mark Twain's life, suggested projects, discussion topics, essay subjects, library activities, a list of Mark Twain's books, and another list of works about him. Two 5 x 8 stills are slipped into the brochure for use on the bulletin board. The only 'plug' that Warner gets, and it is entirely justifiable, is a list of other forthcoming films, definitely with 'school' possibilities.

"I would like to see this type of campaign put on for every educationally worthy theatrical film, in the hope that the welcome given to such pictures by the school population would encourage all producers to raise their sights as Warners have done and convince all that they are thus contributing permanent values to our national culture, the usefulness of which extends far beyond the last theatrical run. It is a pity that this film, like other outstanding Warner productions, is not to be available in 16mm for actual school use." The whole field will welcome such a move if and when it comes. N.L.G.

## Current Film News

WALTER O. GUTLOHN, INC., 25 W. 45th St., New York, is distributing a new series of 16mm. sound films, some in color, released by the Polish Information Center, which tell a realistic tale of Polish suffering, her cultural and industrial achievements and her heroic efforts against the Nazi invaders. The films are arranged in two separate programs, as follows:

**Program No. 1:** "Unfinished Journey"—1 reel—illustrating the life and death of General Wladyslaw Sikorski; "The Polish Sailor"—1 reel—thrilling story of a Polish sailor's escape by submarine to a Scottish port, thence to Russia aboard a Polish destroyer in a convoy to Murmansk; "Scottish Mazurka"—2 reels, color—soldiers training in Scotland find fun and relaxation in charming evenings spent with hospital Scots (highlights are Polish and Scottish folk dances); "Calling Mr. Smith"—1 reel, color—aims to awaken the world to the cruel Nazi persecution of Polish scientists and professors and their destruction of Polish culture.

**Program No. 2:** "Kitbag Songs"—1 reel—soldier choir sings popular songs of the Polish and English Armies; "The Price of Freedom"—2 reels—development of Gdynia from a small fishing village to the largest and most modern Polish Port on the Baltic; "Land of My Mother"—3 reels, color—trip around pre-war Poland, with narration by Eve Curie, who speaks with tenderness of the land of her famous mother, telling of the mellow charm of Poland before the war, her progress in industry, and her vitality and will-to-survive to forge new achievements. A Polish language short completes each of these programs.

THE COORDINATOR OF INTER-AMERICAN AFFAIRS, Motion Picture Division, 444 Madison Ave., New York, announce the release of several new films on South America, namely:

**Brazilian Quartz Goes to War** (10 min.)—a report of the mining of quartz in Brazil and the part it is playing in winning the war.

**Heart of the Inca Empire** (19 min.)—an educational study of the ruins of the famous Inca City of Machu Picchu near Cuzco, Peru; types of homes, temples, fortresses, roads and palaces.

**Housing in Chile** (19 min.)—one of the newest Julien Bryan subjects telling the story of the progressive steps now being taken by Chile in the housing problem.

**Wealth of the Andes** (19 min. color)—a strip to the Cerro de Pasco mining district in the Andes mountains of Peru, where copper and lead are mined.

**Young Uruguay** (19 min.)—A Julien Bryan production showing how the young people in this small republic, which has the highest degree of literacy in South America, live, work, play, and go to school.

BRANDON FILMS, INC., 1600 Broadway, New York, announce for June release a new film on experimental psychology, presenting:

**Experiments in the Revival of Organisms**—16mm. sound, 20 min.—narrated by Prof. J. B. S. Haldane, eminent British scientist, and endorsed by Prof. Walter B. Cannon. The film records the successful experiments in the resuscitation of life to dead animals, as conducted by Dr. S. S. Bryukhonenko at the Institute of Experimental Physiology and Therapy, Voronezh, U. S. S. R. According to the New York Times, the experiments are hailed by American biologists as promising a new epoch in medical science "bringing closer the day when operations now incompatible with life will be possible." These include repair to a damaged heart or brain and the restoration of persons who died of shock and hemorrhage.

The 1944 *Blue List*—Brandon's catalog of "Selected Motion Pictures, 16mm. Sound and Silent"—is now ready and may be obtained upon request. It is an extensive listing of 110 pages, combining the 1944 Blue List of Selected Films; Wartime Film Bulletin No. 1, No. 2; and Movies to Help Win the War. The films are grouped under the following main topics: Feature Length Films, United Nations, Newsreel History of the War, Our Enemies, Our Armed Services, The Home Front, Vital Areas, Foreign Language Shorts, Educational Shorts, Recreational Shorts, U. S. Government Films. Most of these large groups are further classified. For instance under Educational Shorts there are such sub-headings as Democracy, American History, Social Problems, Health, Home Economics, Literature, Aviation, Sciences, Art Techniques, etc. Suggestions are also given as to suitable films for Victory Programs and Film Forums.

PICTORIAL FILMS, INC., R. K. O. Building, New York, makes available this month another subject in the RKO series, *This Is America*, namely:

**Merchant Seaman**—a tribute to these tough sons of the sea on whom rests the burden of keeping the nation's life-lines open.

**Lieutenant Smith**—to be released in July—describes the special training course at Fort Benning Officer's Candidate School, showing how future Second Lieutenants live, eat and play.

DEVRY FILMS & LABORATORIES, 1111 Ave., Chicago, have just issued a new 72-page catalog of 16mm. sound and silent films for "Education, Inspiration, Recreation", which are available from them. Generously illustrated, the catalog offers educational material on a great variety of subjects. There are films for primary grades, biological and physical science, geography, history, agriculture, safety, health, music, literature, sports, vocational training and industry.

COMMONWEALTH PICTURES CORPORATION, 729 Seventh Avenue, New York 19, N. Y., has released in 16mm. sound, the feature:

**Jacare**—8 reels—a thrilling adventure of two intrepid hunters, photographed in the density and lush beauty of the Amazon wilderness. A gripping climax pictures a bare-handed struggle with a crawling and killing beast of the jungle. Narration is by Frank Buck.

OFFICE OF WAR INFORMATION, Bureau of Motion Pictures, Washington, D. C., has received prints of the following films for distribution to OWI depositories:

**Care of Children of Working Mothers**—20 min.—tells what a child care center is and how it operates.

**Food and Magic**—10 min.—points out the necessity for increased production, conservation, and sharing of food.

**The Negro Soldier**—45 min.—depicts the contribution of the Negro in all of the wars of the Republic from the War of Independence through the present war.

**All Out for Victory**—22 min.—shows the conversion of peace time industries to war industries. (Sponsored by Firestone).

**Challenge to Democracy**—11 min.—a report on the evacuation of the Japs from the West Coast and how resulting problems were met.

### Entertainment Releases in 16mm

BELL & HOWELL Co., 1801 Larchmont Ave., Chicago, have acquired two new Universal entertainment features, which may be rented for approved non-theatrical audiences. They are:

**The Great Impersonation**—7 reels—a streamlined version of E. Phillips Oppenheim's classic tale of counter-espionage. The cast includes Ralph Bellamy and Evelyn Ankers.

**When Johnny Comes Marching Home**—8 reels—featuring Donald O'Connor, Gloria Jean, Peggy Ryan and Allan Jones. Hero on furlough tries to avoid being lionized, and comes under the "protection" of live-wire group of teen-age youngsters.

POST PICTURES CORPORATION, 723 Seventh Ave., New York, reports the following Hal Roach feature picture now available on 16mm. sound:

**Broadway Limited**—an exciting comedy featuring Victor McLaglen, Dennis O'Keefe, Marjorie Woodworth, Patsy Kelly and Zasu Pitts. A baby "borrowed" for a publicity stunt by a temperamental motion picture director is the center of lively action.

**Correction:**—Two features announced in the "Current Film News" department, page 230 of the May issue were incorrectly listed. *Here We Go Again* was produced by RKO, instead of Universal, and *Get Hep to Love* is a Universal production, not RKO.

## Among the Producers

### New Keystone Projector and Slide Units

Keystone View Company of Meadville, Pennsylvania, has just put on the market a new slide projector—the Keystone Overhead Projector—designed particularly for classroom use. Their publicity calls attention to the following features: (1) short-focus lens brings instructor, projector and slide together at the front of the room; (2) slide is visible on the slide table, enabling instructor to discuss its contents while facing the class; (3) when one slide is pushed over the projector opening it pushes off the other slide; (4) as the slide table is not inclosed, instructor can point out on the slide, the items being discussed, and the pointer will be seen on the screen; (5) lamp house is air cooled by a motor-driven fan which prolongs the life of the lamp and prevents breaking of condensing lenses and slides; (6) instructor can write or draw on etched glass placed on the slide table and the development of writing or drawing is reproduced on the screen; (7) ideal for use of the Flashmeter, as it makes feasible, through use of a slotted-screen device, the showing of individual words, phrases or sentences from a slide consisting of several lines.

The Keystone View Company also announces the publication of two additions to a series of Geography Units—"Glimpses of the South Sea Islands" and "Glimpses of New Zealand and Australia." Each of these units is furnished either in stereographs for individual reference work or in standard lantern slides for use with the class or group. There are twenty-five subjects and an additional map slide for the lantern-slide series. As usual, a manual for the teacher prepared by Dr. Zoe Thralls of the University of Pittsburgh, is provided. Dr. Thralls has now edited fifty-six units in the Keystone Series of Geography Units covering the major proportion of the activities of peoples of the world.

### Argus, Incorporated

At a special meeting of the stockholders in May, it was voted to change the name of International Industries, Incorporated, of Ann Arbor, Michigan, to Argus, Incorporated, in order to eliminate the confusion that resulted between the corporate name and the product name, Argus. The name Argus on cameras and photographic accessories has been internationally established. In 1936 the company introduced the first popular priced "candid" or "miniature" camera. At present entirely devoted to war production of airborne radio equipment, and optical fire control instruments for the Armed Forces, Argus has postwar plans for a line of precision cameras and accessories as well as a number of other fine optical instruments.

### Radiant Screen Finder

A new "Screen Finder" to meet a long-felt need among all users of motion pictures, slide films, slides and opaque projectors has just been released by the Radiant Manufacturing Company of Chicago. This convenient slide pocket scale enables any user to obtain perfect projection results by answering important questions quickly and accurately. It shows at a glance:

(1) The proper screen size for each distance between screen and projector with a given lens. (2) The proper screen model to select. (3) The proper distance between screen and projector to obtain any desired size of picture. (4) The proper lens to use to obtain perfect results for each distance. (5) Correct show time for 8 mm. and 16 mm. silent and 16 mm. sound films.

The Radiant Screen Finder is easy to read, durable and compact. It answers all "movie" questions on one side—and all "still" questions on the other. The list price of this unique device is 50c but it is furnished without charge to all photographic and educational dealers and their personnel upon request on dealer's letterhead.

### Kodachromes on the Eye

Bausch & Lomb Optical Company of Rochester, New York, has prepared two sets of thirty-four Kodachrome slides each—one set in 2x2 slides, the other in 3¼x4—showing the anatomical construction of the human eye. The slides are accurate reproductions of the McHugh paintings in the new book on "The Human Eye in Anatomical Transparencies," which is available from Bausch & Lomb. By means of these slides, the composite layers of the eye are projected on the screen just as they appear in the transparent acetate views in the book. A helpful teachers manual accompanies each set of slides. The kodachromes may be purchased either individually, or in sets.

### DeVry Service Bulletins

DeVry School Service Bulletin No. 2, "Suggestions for Organizing Student Operators' Club for the Projected Teaching Aids Department," has been prepared by Mr. C. R. Crakes, Educational Consultant for the DeVry Corporation, to aid administrators of visual education programs in the training and organization of student operators. The suggestions offered are based on practical experience.

A series of similar bulletins will be issued from time to time as a service to schools. Bulletin No. 1, "Suggested Bibliography on The Use of Motion Pictures in Education During the Past Twenty Years," was noted in a preceding issue. These bulletins are free to all educators upon request to DeVry Corporation, 1111 Armitage Ave., Chicago.

### Spencer Model VA Now Available from Stock

The demands of the Army and Navy for the Spencer Model VA Combination Opaque and Lantern Slide Delineascope having been filled for the present, Spencer Lens Company now can supply these projectors for essential needs from stock. This model is equipped with a 500 watt, 115 volt prefocused base Mazda bulb, and standard slide carrier. (A slide carrier for 2x2 slides is also available).

Since the blanket priority rating assigned to educational institutions, etc., under CMP Regulation 5A prohibits the use of the rating for the purchase of items exceeding \$100.00, such a rating may not be used for obtaining a Model VA. A simple application, however, should be filed with the nearest WPB Office for permission to receive one of these instruments. The necessary application form with instructions, and complete specifications for requisitioning the items now available in their catalog, will be furnished upon request to Spencer Lens Company, Buffalo 1, New York.

### New Kodachromes on Latin America

The release of eight hundred 2x2 kodachromes on fifteen Latin American lands, is announced by Kime Kodachromes. The slides are organized around a trip through each country, showing principal cities, markets, foods, transportation, clothing, animals, and scenery. The material is thoroughly explained in manuals that represent months of research on the part of the two educators who photographed the series.

Visual education libraries and other interested institutions are invited to ask for an inspection set to screen and select the pictures that best fit their courses of study. Purchasers may copy from the ample manuals whatever materials may be useful with the pictures selected. For further details, address The Kime Kodachromes, 1823 East Morada Place, Altadena, California.

## Additional Valuable Literature —

### “1000 AND ONE”—The Blue Book of Films

“1000 and ONE” The Blue Book of Non-Theatrical Films, published annually is famous in the field of visual instruction as the standard film reference, indispensable to film users in the educational field. The **CURRENT, NINETEENTH EDITION** lists and describes **over 5,000 films**, classified into 176 different subject groups (including large groups of entertainment subjects). A valuable feature is a complete alphabetical list of every film title in the directory. Other information includes designation of whether a film is available in 16mm, or 35mm, silent or sound, number of reels and sources distributing the films, with range of prices charged.

136 pp. Paper. Price 75c. (25c to E. S. Subscribers)

### FILM EVALUATION SUPPLEMENTS TO “1000 and ONE” under The National Film Evaluation Project

A new and unique service to the teaching field. Film Evaluations made by nation-wide Judging Committee of over 500 teachers after actual use of the films with classes.

Each Supplement consists of 50 standard-size library cards carrying detailed evaluations of 50 films, based on combined scores of 15 or more teachers on each film. Three Supplements have appeared to date. Another appears as soon as 50 more films attain their quota of 15 or more scores.

Price per Supplement—50 cards in carton, serially numbered 1 to 50, 51 to 100, 101 to 150, etc., with full explanations accompanying, 50 cents (postpaid if cash with order.)

### THE AUDIO-VISUAL HANDBOOK (4th Edition) By Ellsworth C. Dent

Presents in convenient form, practical information for those interested in applying visual and audio-visual aids to instruction. The six chapters include discussions on “The Status of Visual Instruction,” “Types of Visual Aids and Their Use,” “Types of Audio-Visual Aids to Instruction,” “Types of Sound Aids for Schools,” “Organizing the Audio-Visual Service,” “Source List of Materials and Equipment.”

212 pp. Illus. Cloth. Price \$1.75

### AUDIO-VISUAL AIDS TO INSTRUCTION By Harry C McKown and Alvin B. Roberts

A practical volume which shows the teacher and administrator how to select, organize, and utilize audio-visual aids of all types, in all subjects, and at all levels, from kindergarten through the twelfth grade. Primary emphasis is on actual practice and every effort has been made to include specific information and advice which will be most helpful in the classroom.

384pp. Cloth. Illus. Price \$3.00

### PICTURE VALUES IN EDUCATION By Joseph J. Weber, Ph. D.

Presents in unusually interesting form the results of the extended investigations on the teaching values of the lantern slide and stereograph. 156 pp. Cloth. Illus. Price \$1.00

(67c to E. S. subscribers)

### AN ALTERNATIVE FOR REVOLUTION AND WAR By Albert E. Osborne.

A stimulating, wide-range view of the higher potentialities of visual instruction in promoting world harmony by a “more humanity-centered education.” A pertinent reply to H. G. Well’s dictum that the “future is a race between education and catastrophe.”

124 pp. Cloth. Price \$1.25.

### EVALUATION OF STILL PICTURES FOR INSTRUCTIONAL USE. By Lelia Trolinger

A full presentation of the latest piece of research on determination of teaching values of pictures. Development of the Score Card and elaborate experiment in use of same. Full documentation, tabulation of results, and appendices. The latest, most complete and scholarly investigation of a problem in the visual teaching field that has long needed such a solution.

48 pp. Paper. Illus. Price 50c.

### PRODUCING SCHOOL MOVIES By Eleanor Child and Hardy R. Finch

Based on first-hand experiences of the authors and those of many other teachers and movie enthusiasts. Chapters are “Organization (of a Club); Choosing the Idea; The Scenario; Buying Equipment; Using the Equipment; Filming the Picture; Advanced Techniques; Final Preparation and Showing. A welcome book to those who want movie-making explained in simple terms.

151 pp. Paper. Illus. Price \$1.50.

### SELECTED FILMS FOR AMERICAN HISTORY AND PROBLEMS. By William H. Hartley

Part I gives directions for obtaining, evaluating and utilizing films. Part II comprises a fully annotated catalog of the most useful films for illustrating various aspects of American Civilization. Title of film, length, whether sound or silent, production date, producer, sale and rental price and grade level suitability, are given. Also synopsis of film content. Suggestions are offered concerning most effective application of the film to the teaching situation.

275 pp. Cloth. Price \$2.25.

### THE USE OF VISUAL AIDS IN TEACHING By Ella Callista Clark, Ph. D.

Brief, clear, concise, authoritative. An attractively printed manual of procedure for all visual aids in teaching, with stimulating suggestions for the inexperienced teachers as well as for the veteran.

24 pp. Paper. Illus. Price 25c.

### HOW TO MAKE HAND-MADE LANTERN SLIDES By G. E. Hamilton

24 pp. Paper. Price 10c.

### THE STEREOGRAPH and LANTERN SLIDE IN EDUCATION. By G. E. Hamilton.

The most comprehensive discussion yet published.

47 pp. Paper. Price 15c.

# CASTLE FILMS PRESENTS MOVIES FOR

## INSTRUCTION—INSPIRATION—RECREATION

Instructive Entertainment:

Vivid Education:

Wholesome Recreation:

*"WING, CLAW and FANG"*

*"Belles of the South Seas"*

*"Puddy the Pup"*

A KITTEN, a raven, a penguin and a lion are the astonishing stars of this amazing movie. Your students will be astounded to see what man's patience can teach birds and beasts . . . fascinated by the droll antics of fur and feather clowns. They'll thrill at the drama of a lion in savage play with his trainer. A film that young people will enjoy now, and for years to come.

AN AUTHENTIC film study of Polynesian and Melanesian peoples. Let your students travel to the South Seas...observe the native women of Samoa, Tahiti, New Zealand, Fiji, Papua . . . their wondrous tribal dances...their odd, ancient customs. For scenic beauty... anthropological enlightenment . . . add this prize movie to your film library.

A DELIGHTFUL new cartoon character . . . Puddy . . . all little dogs wrapped up in one bundle of hilarious pup! Add some honest-to-goodness laughs to your film library. Give your students plenty of healthy fun...in these four different cartoon movies.

1. "Circus Copers"      3. "Dog Wanted"
2. "Down in the Deep"      4. "Puddy Picks A Bone"

# 16mm Industry Becomes of Age

**NOW TWENTY-ONE YEARS OLD . . .**

August 12, 1923, marked the birth of a new industry—an American industry that has now come of age.

Victor is proud to have played such an important part in the inception and development of the 16 millimeter industry in which vision, ingenuity and devoted adherence to the principle of the safety standard have brought about such outstanding achievements — accomplishments which penetrate to every corner of the globe.

The growth of the 16 millimeter industry, since Alexander F. Victor invented and produced the first 16 millimeter camera and projector and the Eastman Kodak Company produced the first 16 millimeter film, is a story typical of American ingenuity and enterprise. At first, like any human infant, 16 millimeter was confined entirely

within the home . . . then, in a few years it went to school, where it rapidly showed its great adaptability. As it emerged from adolescence it was called into the business world . . . and now, grown to manhood, it has matured to meet the severest test of all, training our soldiers and production workers, to speed and facilitate the defeat of our enemies. In the peaceful world of tomorrow, its horizons and possibilities are limitless—for entertainment, education, training and selling.

To Alexander F. Victor, champion of the 16 millimeter cause from the beginning, and to his contemporaries in the industry who shared his faith and have contributed much to the development and progress of 16 millimeter films and equipment, the Victor organization offers a salute on this, the 21st birthday of the 16 millimeter industry.

# Alexander F. Victor, designer and producer of the first 16mm movie equipment

ALEXANDER F. VICTOR, President of the Victor Animatograph Corporation, designed and produced the first 16mm camera and projector in 1923. As early as 1918 Victor sponsored the cause of a separate, distinct safety size for non-theatrical film and equipment. His many inventions have been a major factor in the progress and present high standing of the 16mm industry.

August 12, 1923, the advertisement of Victor 16mm Cameras and Projectors to the public was published in Davenport, Iowa.

SECOND SECTION THE DAVENPORT DEMOCRAT AND LEADER DAVENPORT, IOWA, SUNDAY MORNING, AUGUST 12, 1923. EDITORIAL THEATERS, SPORT CLASSIFIED ADS. PRICE FIVE CENTS

## Make Your Own Motion Pictures!

at very low cost and with guaranteed success

Through revolutionary changes of design and construction and the invention of a radically new and simplified mechanism performing work formerly done by many and complicated parts A. F. Victor has opened up to the amateur the marvelous field of motion-photography.

**THE VICTOR CINE-CAMERA**  
This camera is a masterpiece of design and construction... It is the only camera of its kind... The price is \$55. Tax Paid.

## The Victor Cine-Camera

with the new reversible 16 Millimeter film

Puts life into Your Pictures at a New Low Cost that Everyone Can Afford. Low Camera Cost and Low Film Expense Renders Motion Picture Photography as Inexpensive as Taking Ordinary Lifeless Stills

At Home, a life-motion history of the family will soon become your most cherished possession and a precious heirloom. Make only a few feet of film, two or three times each year, of all the members of the family and add the scenes together year by year—the modern "family album" in motion pictures. Every event of personal importance and interest is easily recorded with the Victor Cine-Camera.

If interested in Sports, make motion pictures at the games, races and fairs, giving you a realistic record in action and revealing many important features that escape the most observing eye in realistic form.

New Pictures of your own make may be taken from time to time, soon giving you an interesting and valuable collection of scores of historical public events.

In Business, the Victor Cine-Camera is used in various ways. This subject will be discussed in detail if you are interested.

Anyone over twelve years of age can make perfect motion pictures of professional quality with the Victor Cine-Camera

**EASTMAN CINE-KODAK 16 MILLIMETER DAYLIGHT LOADING FILM IS USED**  
After exposure in the camera the film is mailed to the Eastman Laboratories for development and reversal, and is quickly returned post paid, ready for showing. Each 100 foot spool permits the taking of a scene up to nearly five minutes duration, or several short scenes as desired, with one loading of the camera.

No "positive print" is required. The film exposed in the camera is developed and reversed to a positive—no printing of negative in positive—no duplication of expense—results invariably uniform and satisfactory. Any number of duplicates can be made.

Price per 100 foot spool (including all finishing charges) \$6.00

## The Victor Cine-Projector

Shows Your Pictures on the Screen with Truly Professional Perfection. The Image is Rock-Steady, Flickerless and Brilliant.

**THE VICTOR CINE-PROJECTOR**  
The size is 8 1/2 x 8 1/2 inches. Weight 12 pounds. The price is \$45 complete ready for service.

Place the Victor Cine-Projector on a stand or table about fifteen feet from the wall. In two minutes you have the film "threaded" ready for showing.

Attach the plug on the end of the eight-foot cord, to any convenient lamp socket and turn on the current.

Then everything is in readiness to show your family and your friends the pictures you have taken with the Victor Cine-Camera.

You will be proud of the results. There on the screen are the pictures you "shot" in all the realism of the original.

If someone says "Wait a minute—let's see that scene"—just stop the projector and let the picture stand still. Run slow or fast, as you wish, to get the best effect.

The Victor Cine-Projector is so simple that it takes only ten minutes for anyone to learn to run it.

The Victor Cine-Camera and Victor Cine-Projector are guaranteed for mechanical and optical perfection and to equal every claim for completely satisfactory service

Manufactured by the VICTOR ANIMATOGRAPH CO., INC., DAVENPORT, IOWA

**16mm. SILENT  
MOTION PICTURE  
CLASSROOM TEACHING FILMS**

**112-PAGE  
TEACHER'S LESSON GUIDE**

FILMSETS' value and utility are increased many-fold by the 112-page Teachers' Manual with its 672 carefully selected illustrations from the films—examples from which are reproduced in the illustration above. Each 2-page spread is a lesson outline for each of the 48 FILMSETS units—quick, convenient supplement to introduction and review of textbook or lesson subject. Manual does not dictate how lessons are to be taught.

To FILMSETS purchasers are available metal storage cabinets attractively designed and finished for desk-top use.

**NEW—600—KODACHROME COLOR SLIDES**  
Write for DeVRY LIBRARY of KODACHROME COLOR SLIDES—600 masterpieces of scenic points of interest in the United States, Canada, Mexico, Hawaii and Latin America. 2" x 2" in durable, protective ready-mounts—these beautiful slides are packed in interesting related groups of six each. These Visual Aids give students the opportunity to see first-hand many beautiful places of interest just as Nature intended. *Selected scenery! Superb photography! Vivid coloring! Excellent composition!*

**BUY ANOTHER WAR BOND!**

To Help the Teacher Vitalize the Subject of Geography in the Intermediate Elementary Grades—FILMSETS are DIFFERENT from the ordinary types of educational film. FILMSETS forty-eight, 200-ft. silent films—22 ECONOMIC subjects (Food, Shelter, Clothing), and 26 REGIONAL subjects (Place Geography)—were planned, photographed, edited and captioned by eminent educators to FIT THE COURSE OF STUDY IN GEOGRAPHY FOR THE AGE LEVEL OF THE INTERMEDIATE GRADES. • Like the great majority of training films produced for the Armed Forces—(films credited with helping trainees learn up to 35% faster, and retain subject matter 55% longer)—FILMSETS are SHORT, SIMPLE and DIRECT CLASSROOM TEACHING FILMS. • Every scene in all forty-eight films is authentic—photographed or taken in the exact locale of actual residents and activities. Every scene has real geographic and social significance. • With FILMSETS in each school, the lack of film available is eliminated, the teacher can use the particular Filmset subject at the precise time it becomes pertinent to the lesson. • Write today for FILMSETS THAT took more than five years to produce, at a cost of \$100,000.00—and that are NOW AVAILABLE at the surprisingly low price of \$12.00 per reel. Buy all 48 films, or as many as you wish. We suggest you order one Filmset Unit and beautifully illustrated 112-page Teachers' Manual for only \$14.50, and convince yourself of FILMSETS unequalled teaching value.

*You'll* **WANT DeVRY WAR-PERFECTED PROJECTORS WHEN AVAILABLE**

This fine prewar 16mm. Sound-on-Film Projector Model will have a finer successor on "V-DAY". Projected Training aids for use in School, Shop, and Community Auditorium, will reflect wartime improvement and refinement. Out of War's relentless proving ground is emerging a NEW, postwar DeVRY—a DeVRY worth waiting for by you who want the best in motion picture equipment, sound or silent.

**AN OUTSTANDING NAME IN VISUAL EDUCATION**

STARS awarded for continued excellence in the production of motion picture sound equipment.

## To Man the Convoys

Merchant ships—of critical importance in the logistics of war—must be competently manned to supply the far-flung war fronts of the United Nations with adequate tonnages of food, guns, tanks, planes and fuel. More than 1200 major ships and 50,000 men of the U. S. Merchant Marine are carrying on a task which has contributed mightily to the successes we are now achieving.

Each week, each month, sees more ships sliding down the ways. More

men—thousands of them—must be recruited and trained . . . *quickly*.

The visual methods pioneered in the schools and colleges of the country are playing an important part in expediting this training.

**I**T WAS a swell boat—a beautiful boat. There was only one thing wrong . . . it was too big to get out of the basement.

Take a lesson from the fellow who built the boat. Plan *now* to incorporate adequate motion picture facilities in that postwar school your community should have. Don't improvise makeshifts. They usually cost more and are never completely satisfactory.

Forward-looking educators have proved that motion pictures will play a *new* and *vital* part in tomorrow's educational systems because they help children learn *faster*, retain *longer*, *what* they've learned. They enable teachers to teach *more* without adding *extra* time to the curriculum.

In addition to their educational aspects, motion pictures are necessary in the bigger part tomorrow's school will play in the civic and social life of the community . . . both as entertainment and as a means of teaching our

children more about their civic duties.

Through research in Opti-onics, we've kept pace with new trends and techniques in visual education. Filmosound Projectors give a *new realism* never before obtained . . . clearer, sharper images than have heretofore been possible . . . a seeming *absence* of mechanical intervention . . . cooler, quieter operation with simplified controls.

**You Can Get a PRIORITY NOW**

It is possible for schools to obtain Bell & Howell Filmosound Projectors *now*. You may get a priority rating right away—and the sooner your order is entered, the sooner we can fill it.

So send the coupon below. We'll mail your Filmosound folder and the name of our Visual Education Specialist in your locality. You'll find him glad to advise you on the correct type of Bell & Howell equipment you need.

Bell & Howell Company, Chicago; New York; Hollywood; Washington, D. C.; London. *Established 1907.*

# FREE to School Administrators and Teachers . . .

*This exceptionally interesting and informative booklet to add to your library on Audio-Visual Training*

● Chances are you may have read the three articles reprinted in this booklet when they first appeared in "THE SCHOOL EXECUTIVE," but we believe you will be interested in reviewing them in this handy form because:

1. They will assist you in making post-war plans for your particular school
2. They emphasize the need for proper evaluation and use of audio-visual teaching aids
3. They illustrate in practicable forms the modern way in which audio-visual aids can contribute importantly to educational programs. Use the coupon below to order your copy or copies now!

## Good schools need better equipment for best teaching results

**RCA School Sound Systems** serve as nerve centers for instant communication with any and every part of the school building or buildings. Invaluable to school administrators. Already in successful use in thousands of schools. For complete information write The Educational Dept., RCA, Camden, N. J.

**The New RCA 16mm. Sound Projector** for Schools when available will include many important advances in projector design, such as even tension take-up; removable gate for easy projector aperture cleaning; centralized controls; rewind without changing reels; one-point oiling; etc. Because of military demands these new RCA projectors are not available now for civilian use. But be sure to see the new RCA projector at your RCA dealer's showroom before you purchase post-war equipment.

**VICTOR Records for Schools.** Already well established as an extremely useful teaching tool, Victor records are growing more and more popular in classroom work. Thousands of records are available to help teachers in music, speech, drama, foreign languages, history, literature and many other subjects.

## *Editorial*

# *The End Of Adolescence*

THE field of visual education has had eons of infancy, a century of childhood and adolescence, and may reach maturity in the next few years.

The period of infancy was incredibly long. The date of its beginning can be pushed back indefinitely to the dawn of human history itself. Many a writer in recent years has thought to impress his readers with the venerable antiquity of visual education by tracing its origins "clear back to Comenius and Pestalozzi". But why stop there? The Roman poet, Horace, writing when Christ was born, stated the foundation principles of visual learning with complete clarity and modernity. Christ himself gave a notable demonstration of visual teaching with those four memorable words, "Show me a penny", and the perfect pedagogical procedure that followed. First, the visual aid before the eyes of his hearers; then, the directive question as to whose image and superscription appeared thereon; then, response from the learners, "Caesar's"; and the splendid finality of that conclusion, "Render unto Caesar the things that are Caesar's, and unto God the things that are God's". The inductive method and visualization used by the master teacher nineteen hundred years ago! Perfect reasoning from the concrete to the abstract, from the visible to the invisible, the true and ultimate purpose of all teaching. Visual teaching is good when visual aids are used as Christ used that Roman sestertius. But three hundred years before Christ we find Aristotle basing his natural science solidly on visual experience with actual flora and fauna. And three thousand years still earlier, the Egyptians were telling their current history in hieroglyphic pictures that are still teaching us today. The Chinese, the Mesopotamian, the Yucatan peoples did the same. And for three times ten thousand years the painted walls of the Cro-Magnon caves told to eyes that looked upon them—from the neighbors that watched the artist paint to the tourists of today—the visualized experiences of pre-ancient man.

The infancy of visual education dated from the infancy of man. It lasted long, perhaps until the middle of the nineteenth century with the advent of photography, man's greatest achievement after printing. The childhood of visual education may be dated from Daguerre and Niepce. Its adolescence began when screen projection came, to multiply a picture's value precisely by the number of individuals viewing it simultaneously. And its maturity? It may be almost upon us.

For the last twenty-two years, come December, THE EDUCATIONAL SCREEN has been part and parcel of the adolescent period of visual education. It has been fully as adolescent as the period. It has shared the work and worry of both the scholastic and the commercial fields. It has watched many a dream glow and fade, many a well-intentioned enterprise rise and fall, many a school begin the struggle toward teaching and succumb to the handicaps besetting semi-ignorant adolescence. The handicaps have been many—for the schools, lack of resources, of equipment, of worthwhile visual materials, of teacher-training; for the commercial companies, scholastic lethargy,

listless market, lack of adequate revenues to cover their enormously costly experimentation, production and promotion. The magazine made common cause with all. In the early years it was often skirting the edges of oblivion, despite the loyal support and cooperation of a small proportion of the schools and a large proportion of the commercial firms.

The primary cause, however, underlying the fumbling progress and foggy thinking of the past two decades, can be traced undoubtedly to the power of academic tradition and the inertia of the learned. Formal education is a venerable institution, with attitudes and methods developed slowly through centuries and solidified by mere lapse of time. It is constitutionally averse to sudden change. It is congenitally suspicious of the "new" because it is not old. It is not the outstanding figures in the educational field who have brought visual education thus far on its road, but the rank and file of the teaching profession with sufficient vision and conviction to ignore precedent and resist tradition.

The end of our adolescence is near at hand. World War II may mark the beginning of maturity. Seemingly, and unfortunately, it took a world war to amass the necessary irresistible evidence. With such unparalleled incentives to progress, as the extraordinary achievements in the visual training of the Armed Forces, visual education should grow up, at last. In the face of such evidence the powers behind the educational throne may gradually align themselves with a movement now proven beyond the peradventure of a doubt. Thousands of hesitants in the rank and file will then be emboldened to act as they have long wanted to act. The national organization of the Department of Visual Instruction should find real growth possible at last and a wider opportunity to function importantly and effectively. But the most stalwart shoulders put to the wheel of visual progress will be those of the hundreds of thousands returning home from war service—who have *seen* visual teaching at work, who have *done* the actual teaching, who have *learned* by visual ways as they never learned before. This homecoming army will permeate the schools and communities of the land with new spirit and high enthusiasm that will set a new pace in the march of visual education to its rightful destiny. N. L. G.

### **Announcing an Announcement**

The visual field is on the eve of growth to far greater things. THE EDUCATIONAL SCREEN means to match that growth with higher values and fuller service.

New policies, plans, and personnel, long studied, are now completed. Announcement could be made now, did space permit. Instead we give our readers thirty days for pleasurable anticipation.

This, therefore, is to say that there will be an important announcement in the October issue.

# The Challenge of Television

*Some reasons why educators should give serious consideration now to the potentialities of television as a tool for visual instruction.*

**A**FTER an interruption caused by the War, resumption in New York City of live studio television programs on the part of both the National and Columbia Broadcasting Systems, coupled with a regular schedule of telecasts from the Dumont station, has renewed interest in the post-war prospects for this newest educational medium of such vast potentialities. New York University and The New School for Social Research are already offering courses in television programming and techniques.

There is little doubt that as soon as the war is over, a scramble will take place to build television stations and to set up regional and ultimately national networks. So far most applications for television transmitting licenses have been made by large and wealthy industrial groups. This brings up the question of who will control the medium. Those who read the provocative book, *Television—a Struggle for Power\** published several years ago, are finding that some of its predictions are even now proving true. Television has already become big business. The play is for high stakes and even the opening chips are more expensive than the little man can afford.

What will it cost to build a television station after the war? This question has been asked quite frequently of late by advertising sponsors and other groups interested in entering the commercial television field. The answer should be of interest to the educational world as well, for it portends a not entirely hopeful future.

Prices for a completely equipped studio are naturally still vague because post-war costs cannot be accurately gauged. Besides, there is considerable difference of opinion as to what constitutes the desirable minimum of equipment before a television station can be set up for adequate programs. Figures quoted so far seem to run from \$40,000 to \$250,000 for a modestly conceived station layout. A really ambitious design would run a million dollars or even several times that.

This cost factor has a definite bearing on the form which the art of television will take, as well as upon the social and educational use—or disuse—which may be made of the medium.

From a strictly theoretical viewpoint there is almost no end to the educational advantages which television affords. It is able to bring the entire world to the home or to the classroom in the twinkling of an eye. Its faculty for showing history as it actually occurs, its advantage over present radio of combining with sound the more powerful appeal of sight—these immediately suggest programs which will be of great edu-

**JOHN FLORY**  
Documentary Film Producer,  
Grant, Flory & Williams, New York

cational value. Truly the four walls of the classroom can be thrown open.

But will the educational aspects of this new art be subordinated by its commercial exploitation? There are grave dangers that this may be so. Will it be possible for educational institutions such as universities or large city school systems to afford to construct television stations for strictly educational use? Perhaps the growth of Frequency Modulation broadcasting for school purposes on a limited but promising scale is an index that this more complex medium will likewise develop. Perhaps with semi-mass production of television transmitters for the commercial industry after the war, the cost to educational groups can be somewhat reduced from the figures quoted above. Certainly it is not too early for educators to give serious consideration to television for school use, since peace will find another kind of struggle under way. This will be the fight to secure enough channels in the ether for television. For Frequency Modulation will be demanding a much larger allotment of wave bands than heretofore. Television broadcasting, meanwhile, requires a fair wider wave band than present sound broadcasting, so that there will be fierce competition for the limited number of channels which can be allocated in each city or region. Unless educators wake up to the situation and organize to do something about it, they are in grave danger of finding out in the not too distant future

Projection-room equipment in television studio of WRGB, Schenectady, showing motion picture and slide projectors.

\**Television: A Struggle For Power* by Frank C. Waldrop and Joseph Borkin; N. Y. 1938: W. Morrow & Company 299 p.

Two television programs in the making: (left) A puppet play; (right) "Alice in Wonderland."  
(Photos courtesy of General Electric Company)

that commercial interests have staked out claims to all the desirable channels, and that television for educational use has become an orphan over night.

Admittedly it is hard at this time to say where funds for educational television can be raised, and unless tangible evidence is presented that educational institutions actually intend to construct and operate stations after the war, their applications for transmitting licenses and preferential wavelengths will not receive the consideration which they deserve. Here is a situation which deserves prompt and energetic action on the part of all those who are interested in safeguarding for educational use what promises to become one of the most effective tools for visual instruction yet developed.

So far no mention has been made here of the educational programs which might be presented by ordinary commercial television stations, much as certain sustaining programs of a "public interest" type are now carried by the regular commercial radio industry. Experts seem agreed that the problems of securing satisfactory television programs will be more important after the war than purely technical problems of an engineering nature. It will cost no more to produce video entertainment than today's radio show. This may result in programs of a documentary and somewhat educational type receiving greater acceptance in television—certainly in the earlier stages of its development—than they do in present-day commercial radio.

In any case, it is not too soon for educators and visual aids experts to begin to acquaint themselves with the limitations and potentialities of television. Just as the sound motion picture has required constant experimentation to determine its most effective use in the classroom, so its new cousin, television will require a period of probation while intensive efforts

are made to explore its probable utilization.

Television receiving equipment will be considerably improved as a result of war developments, many of them stemming from radar. Screens 18 inches by 24 inches are generally expected to be available for homes. Larger sizes suitable for classroom installation can undoubtedly be developed. The use of protective hoods and other devices may mean that the classroom need not be darkened to the extent now considered necessary for film showings. Cost of receivers should be less than that of present 16mm. sound film projectors.

It may be of interest to mention at this point a few conclusions which have been reached by television broadcasters who have so far experimented with the presentation of material of an educational nature. It has been found that the subject matter best suited for television has an "urgency" appeal. That is to say, a sense of immediacy—a knowledge by the spectator that he is seeing events as they actually happen—is television's greatest program asset. Presidential conventions, international meetings, the eruption of volcanoes, the opening of a great new hydro-electric project, or the every-day doings on a typical farm could all be brought to the children with added significance because they are seen at the very moment they occur.

Television's strong point in educational use is likely to be based on the single showing of a program. Where repetition is required, other visual media such as motion pictures or the film strip or slides would be preferable. It is in the field of curriculum enrichment that television promises to be especially helpful. Background material of a nature too expensive or ephemeral for treatment in films can be handled by television.

# Student Made Kodachrome Slides for History Class

*A splendid classroom project which should inspire other history teachers to similar achievements.*

EARL W. DIBLE, LT. A. C.\*  
High School, Sacramento, California

(Above) A small gold dredger working on the soil on the American River at Coloma. This is the exact site of the famous "Sutter's Mill."  
(Left) Marshall's monument. The figure points to the American River.

"I WANT to take my class on an excursion, but how can I leave my other classes . . . or, how can I arrange transportation for such a large group . . . or, how can I spare the time?" Questions like these and others soon raise such a barrier that a much desired trip is never taken.

However, a resourceful teacher can overcome this impossible situation by bringing the excursion to the class through the use of a very small classroom committee, a 35mm camera and light meter, and roll of kodachrome film. This was done in a beginning United States history class at Sacramento High in Sacramento, California.

The instructor was faced with the problem of bringing to his class a realistic story of the "Western Expansion" by making use of the historical findings in and around Sacramento. It would be wasteful not to make use of the student interest in his own local history and relate its importance to the history of the country as a whole. This is particularly true of a location like Sacramento.

A brief search of student interest found two members interested in photography and in doing historical research which would make their pictorial findings and records absolutely correct.

The two students under the guidance of the instructor spent several weeks in gathering the material on historical sites within a radius of sixty miles

of Sacramento. A thorough search was made of the local library's historical records, of old family albums, and of the local newspaper files, while the Chamber of Commerce was visited and old residents interviewed for additional material.

With an abundance of historical data on hand a list was made of some twenty possible picture locations. The committee then set up the best automobile route and waited for the first Saturday with favorable slide-taking weather conditions. Kodachrome benefits greatly by good sunny weather for recording the bright colors found out-of-doors.

The sixty-mile circle tour started at Sacramento, went through Folsom, Placerville, Ed Dorado, Gold Hill, Coloma and ended at Sacramento. The area covered is one of the richest in gold and historical lore. It covers the heart of the "gold rush" country, which played such an important role in our "Western Expansion" movement.

With the large amount of pre-planning it was not difficult to find the picture locations recommended by the committee. Since this was gold country and since the gold discovery aided the "Western Expansion", the theme of the pictures was to contrast the old with the new. The first kodachrome was taken some ten miles out of Sacramento and showed the results of modern gold dredging. Here good land and dredged land were shown side by side in one picture. In the far distance was a dredger hard at work churning up boulders in search of gold. The second slide was a closeup of a dredger working.

\* Lieutenant Dible is now on leave from Sacramento High School and serving with the Army Air Corps.

These two pictures were to link the present with the past. The third kodachrome was taken at Folsom showing the old Wells Fargo office of 1860. An important link in the transportation system of early California.

The fourth slide was also taken in Folsom and revealed the structure of an early Chinese store with its clumsy iron shutters. From here the road led to El Dorado and a shot was taken of the old burned-out dance hall and hotel. This turned out to be one of the best for showing early California building construction.

The sixth was a general view of Placerville (old Hangtown). This was followed by a picture of the remains of two stores, which represented the once big town of Gold Hill. A few markers gave information which was used later in the classroom. The next stop was Coloma, location of Sutter's original mill. Pictures eight to thirteen were taken here. The views included were: cemetery and markings on old graves, Marshall's monument on top the hill, a general view of the American River from Marshall's monument, two closeups of the marker in the American River which bears the inscription "Sutter's Mill," and a departing shot of a vine-covered jail with the doors wide open.

The return trip added four more views of gold

dredgers to make the transition from the past back to the present. The eighteenth and final slide was a fiery sunset on the Sacramento River.

Since a light meter had been used and the instructor had been careful to check each exposure, not one slide was lost. Although returned in cardboard mounts, the slides were immediately remounted in glass so they could be handled without danger of scratching or finger printing.

The committee previewed the slides and assembled all the data on each scene. A few practice presentations were made under the direction of the instructor and the committee was prepared to make its report to the class.

On the day of the pictorial report, a large map was prepared to show the exact route taken. A short introductory talk prepared the group for the slides to follow. The kodachromes were shown in travelogue style while a student gave the research material. The report was further enriched by a display of old papers and pictures found while on the trip.

The instructor in United States History now has an excellent set of eighteen kodachromes which can be used not only in other classes, but also in classes to come. He further hopes to make more units of classroom slides based on his successful experience with this project.

## The Army Training Film Library

*Description of the Army's set-up for the distribution and utilization of its training films and filmstrips.*

THE visual training aids program of the United States Army is the most comprehensive application of the educational screen as a weapon in fighting the war. A truly tremendous range of subjects has been covered by training films and film strips bearing the insignia of the Signal Corps, official producer of the Army's visual aids. For the Cavalry and the Engineers . . . for the Coast Artillery and the Tank Destroyer Command . . . a steady flow of visual aids has been released to help meet their training needs. First aid for combat casualties, characteristics and nomenclature of the rifle, care of pigeons, principles of electricity, house-to-house fighting; such is a sampling of the titles available to the training officer. Not only is the Army pushing the production of visual aids to teaching areas heretofore undeveloped, but is also giving the educational screen an audience the size of which has never been equaled.

The work of the Signal Corps Army Pictorial Service—the branch specifically charged with photographic activity—constitutes a new and significant frontier in visual education! In the important sphere of distribution and utilization, the Army's large-scale experiences will inevitably influence the trend of post-war administration of the educational film industry.

By SGT. LEWIS SAKS

Technician 4th Grade Central Training Film Library  
Fifth Service Command, Fort Hayes, Columbus, Ohio

War and the need for rapid, efficient training has caused the film to break through in many new directions with the Army charting much of the way. The Army is producing visual aids on a vast scale, and its efforts to get the training film to its men are just as significant.

Integral part of the Army film program is a system of film libraries strategically located to serve troops in training. Although an examination of the film libraries of one particular area may not hold precisely for the entire far-flung system of Army libraries, still a look at one, such as the Fifth Service Command, should provide an interesting chapter in the story of visual aids to training. It is at the film libraries that the training film and film strip meet a crucial test. Here they either move on to their intended soldier audience and make their important contribution to training—or they rest amiably but ineffectually on the shelf.

One fundamental principle can be drawn from the great amount of energy and activity expended by Signal Corps film library personnel in getting visual aids to the training officer and on to the ultimate soldier audience. *The practical worth of every training film and film strip depends upon the extent of its distribution and upon the subsequent use made*

Photos by U. S. Army Signal Corps

(Top) Training officers attend preview of new Signal Corps release in library theatre.  
 (Center) Lt. J. V. LeClair, Fifth Service Command Visual Aids Co-ordinator, tests student in the library projection school.  
 (Bottom) Sgt. Saks preparing filmstrip reviews for publication to inform officers of releases.

of it by training officers and instructors once prints are in their hands.

### The Task of the Film Library

War means playing for keeps, and every factor must be directed toward that end. The job of the Army film library is to see that the vital message and technical information put down on film reach the soldier. In the Fifth Service Command—a sub-division of the Army Service Forces—Central Library headquarters are maintained at Fort Hayes, with sub-libraries located at key camps and posts throughout the area over which the Fifth Service Command has jurisdiction. The libraries receive the many prints of training films and film strips and must meet the booking, handling and co-ordinating problems inherent in so big an "enterprise."

Under leadership of the Central Library, the libraries must see to it that visual aids are put to use by training officers instructing in the thousand-and-one subjects in which the soldier must be skilled. Moreover, the film library must see to it that the film and film strip are used properly, for the difference between "showing" a visual aid and utilizing it properly is a difference often measured in life-and-death terms. To meet these problems, Signal Corps visual aids coordinators run the film libraries and maintain continual field supervision of the visual education program at their camps. The chief coordinator in charge of the Central Library works to expedite the movement of films and projection equipment from his headquarters library to the sub-libraries and the coordinator on duty at the sub-libraries works with the instructor, the last link in getting the film to the soldier.

Aside from a small group of basic films required to be shown to all military personnel, the use of the main body of the excellent productions of the Army Pictorial Service is contingent upon the requests of the individual training officer. The film library must publicise its "wares" and keep the training office informed of latest releases and new methods of utilizing visual aids. The libraries of the Fifth Service Command issue a monthly bulletin of the Central Library and constantly growing catalogs put out by the Central and sub-libraries.

Once the training officer is aware of the assistance he can draw upon from his film library, the library must meet his request for such and such film and film strip at such and such time. To successfully work with a multitude of officers, carrying on different programs at the same installation, requires an efficient, flexible library system. Master booking ledgers are kept by the Central Library to govern the movement of its own prints to the small training units having no sub-library. The Central Library in each command must also serve as a depot to replenish the stock of any of its sub-libraries and be able to speed prints to given points as new training needs arise in the field. Circuit bookings—the automatic scheduling of a film for every camp—are used when an important orientation release is earmarked for Army-wide attendance. Visual aids move fast this way but individual bookings are the order with

training films which must be studied repeatedly over a period of time.

### Film Utilization

The coordinator and his assistants frequently must convince a particular officer of the value of visual aids to his training program. The other extreme is the instructor who must be restrained from overworking films, from using visual aids indiscriminately and destroying their effectiveness. Between these two situations is the majority of training officers, anxious to employ visual aids wisely.

A great deal of the time of the library staff must be spent in seeing that training films and film strips are used properly. Though the educational psychology used by the Army Pictorial Service in its visual aids productions is becoming increasingly effective, the worth of that production is still much greater when the proper functions of the visual aid is understood asked to give short "true-false" quizzes after show-Training officers are encouraged to preview all films before they show them to their men. They are also by the training officer and he uses it accordingly, ing the film in order to promote discussion and make sure the men are getting what they need. A recent development has been the incorporation of such questions right on the last frames of the film strips, although in the main the instructor is expected to prepare his own questions.

### Training of 16mm. Operators

Equipment and projection is another factor in bringing the training contributions of visual aids to bear on the battlefield. Soldiers trained in the operation of 16mm projectors have this fact driven home to them time and time again: *"Remember—All the technique of the motion picture industry . . . All the skill of the director and actors . . . and the total Value of Every Training Film is Dependent Upon the Ability of the Projectionist."*

The Fifth Service Command libraries continually train men to handle projectors skillfully and to screen film smoothly. Short courses in projection at the libraries give a speedy but thorough introduction to the various make projectors used by the Army. There must be no "shutter jump" on the screen if soldiers are to give their undivided attention to a film which may well contain life-saving information. By training numerous men in the accurate use of 16mm. equipment the coordinator not only meets the need of the training officer but he is exposing many soldiers to a new skill which will remain with them after they leave the Army.

### And Tomorrow . . .

So quick and sketchy a survey of the Army Film Library can but suggest some of the fields of Army film distribution and utilization, to be thoroughly studied for the post-war educational screen. The Signal Corps libraries, as they meet their military assignments, are also testing laboratories for new methods in distributing and utilizing visual aids. The size and scope of their activity gives them a significant importance for the growth of the educational film after the war.

# No Story Was Ever Told, Until---

The motion picture recorded and retold the story exactly as it happened

DOES this poem tell you a story?

## When Icicles Hang by the Wall

When icicles hang by the wall  
 And Dick the shepherd blows his nail  
 And Tom bears logs into the hall  
 And milk comes frozen home in pail,  
 When blood is nipp'd and ways be foul,  
 Then nightly sings the staring owl,  
 "Tu-whit, tu-who!" —  
 A merry note,  
 While greasy Joan doth keel the pot.  
 When all aloud the wind doth blow  
 And conghing drowns the parson's saw  
 And birds sit brooding in the snow  
 And Marian's nose looks red and raw,  
 When roasted crabs hiss in the bowl,  
 Then nightly sings the staring owl,  
 "Tu-whit, tu-who!" —  
 A merry note,  
 While greasy Joan doth keel the pot.

William Shakespeare

In parts yes—"icicles by the wall;" "bearing logs into the hall;" "milk frozen in a pail;" Marian's red rose—these all conjure mental pictures within the scope of our experience. But how about "the shepherd blows his nail;" "ways be foul;" "the parson's saw;" and "greasy Joan doth keel the pot?" A little hazy, spotty, or no previous experience upon which to build a mental picture and complete the story?

Again, in prose —

A single strong pull. With a little *bang* the front door had swung to and latched itself. Not only the front door. The other door, leading to the rear, had closed too and latched itself with a little *bang*. And leaning forward from his chair, Boaz blew out the light.

There was not a sound in the shop. Outside, feet continued to go by, ringing on the frozen road; voices were lifted; the wind hustled about the corners of the wooden shell with a continuous, shrill note of whistling. All of this outside, as on another planet. Within the blackness of the shop the complete silence persisted.

"Footfalls" — Wilbur D. Steele

The effectiveness of communicating via the vehicle of semantics is wholly dependent upon previously developed concepts on the part of the reader or listener. If the word symbol is in a familiar language, or code, each word or chain of associated words gives rise to an image or images in the mind. Our imagination is quite dependent upon previous concepts and/or experiences. A word without meaning or outside of previous experience leaves a void in the re-created imagery or story. A story may be very real, but it is real only according to one's own "ideas", "opinions", "sensations", "emotions", and "empathy". It is never the same, true story, but varies according to the individual.

JOHN F. SCHENK

Superintendent of Schools, Corvallis, Oregon

Actually then, no story was ever told—exactly as it happened—until the film and sound film movie recorded and retold the story! Truth, accuracy, exactness, and every psychological emotion or factor can be preserved or transmitted. For example, the colored sound film "The Marines Victory at Tarawa" will tell the story accurately and completely, always the same story, unto eternity for all generations to come.

When one pauses to reflect upon this new invention in the field of communication, the vision of its possibilities transcends anything previously devised or used in the field of language arts. The vision encompasses all that the spoken and written word has done for mankind—and more.

The application of this modern extension to language arts opens a post war frontier in the field of education quite beyond the scope of present oral and written means. Today it is used as a supplementary device to the oral and written words. Tomorrow the oral and written words may be supplementary to this newcomer in language arts. Its application and development will eventually parallel nearly all the textbooks that are used. It will bring the world, the scene, the job, the technique into the classroom at the exact time the academic should be correlated with the experiential.

The magnitude of overhauling and extending the educative processes through visual aids and the film sound track offers startling possibilities for the post war era. When one considers the personnel required to meet fully this new need of use, the employment of manpower may well run to a minimum of a million.

Renovating present facilities for conversion to use of visual aids is a "first" in the post war educational program. The replacement of classroom window shades for projection is relatively simple and inexpensive, easily within the reach of any school district. The purchase of sufficient projectors offers some financial and mechanical difficulties. Schools need a simple, inexpensive projector, so simple that a child can operate the machine. So inexpensive that each classroom teacher will consider it equally essential with a two hundred dollar investment in blackboards, bulletin boards or a room library.

Research in existing state courses of study and the commonly used textbooks would be both a desirable and necessary preparation prior to the actual production of film correlated with the lessons or units in the course of study or textbook. In larger school systems having their own courses of study and units of work "tailor made" films could supplement the standard films for state courses of study. A more complete utilization of films will come about with the production of such "tailor made" films. Instead of

(Concluded on page 315)

# Miscellany of the Month

THE comprehensive photographic record of men, places and events in France since D-Day is an achievement of all time. Never before has "history in the making" been so completely preserved. The pictorial record pours into the Pentagon Building at the rate of over 60,000 feet of film per week from France alone. (Receipts from all theaters are more than twice that footage).

It is the product of 400 cameramen organized under Supreme Headquarters of the Allied Expeditionary Forces. It may surprise some to know that nearly half (190) of the 400 cameramen take still pictures while the rest (210) make movies. But minute details, often vitally important to the General Staff, are either undetectable in the movie or are far better seen and studied in the still picture.

The system for returning films from the French fronts involves (1) message centers at selected points along the entire beachhead, to which (2) couriers from every camera crew bring the exposed negatives, while (3) a fleet of 40-foot crash boats cruise back and forth along the beachhead to pick up films at the message centers and rush them across the channel to England, where (4) official couriers are waiting at all docks to receive the shipments wherever and whenever the boats land and speed them to London, where (5) they are developed, printed in duplicate, projected for clearance by censors on 24-hour-a-day duty, and (6) shipped intact, with censored parts indicated, by plane to Washington, one copy remaining safely in London.

Beside the expert, incessant and perilous work of the individual cameraman—shooting from beach, hill, tree or foxhole, regardless of enemy fire—some fifty landing barges and many tanks were equipped with stationary cameras that push-button into action in crucial situations. These add extraordinary and unique footage, otherwise unobtainable, to the remarkable pictorial record of World War II.

● The past summer, at the request of the Mexican Minister of Education, an elaborate exhibition of radio education in the United States was given at the Palacio de Bellas Artes in Mexico City by the Radio Service of the U. S. Office of Education. It showed the educational radio achievement of American schools and universities, of city school systems, of the Office of the Coordinator of Inter-American Affairs, of radio manufacturers, and of the national broadcasting networks, in school and community enlightenment.

● That educational radio is moving steadily forward is evidenced from all sides, for example: The Texas School of the Air begins this fall a state-wide radio series for Inter-American Educa-

tion, a program sponsored by the State Department of Education and Radio House of the University of Texas, and directed by J. W. Gunstream. It is aimed at Latin-American children and adults throughout Texas to foster understanding, friendship, and cooperation toward solution of Inter-American problems. CIAA funds made the series possible . . . The Radio Commission of the Philadelphia Board of Education broadcasts five programs weekly, entitled, "The Magic of Books" to stimulate reading, "Music in the Air" to teach rhythm, melody, harmony, etc., and for other cultural values "Our Philadelphia Schools", "Junior Town Meeting", and "Once Upon a Time" . . . The National Broadcasting Company and the Board of Education of New York City are cooperating importantly in (1) wide experimentation on student broadcasts and supplementary programs for the classroom, and (2) training students with special talent for later professional radio work, under ideal conditions and with full facilities available.

● World War II will live in motion pictures, according to Captain J. B. Bradley, head of the motion picture division of the National Archives and of the Film Preservation Committee of the Society of Motion Picture Engineers. The countless war shots taken by forces of the United States, Great Britain, Russia and China will be permanently preserved, with a negative, a master positive, and a reference projection print. More than 80% of all motion pictures made in World War I have been destroyed by deterioration of the film.

● The fourteenth annual meeting of the Biological Photographic Association was held at Binghamton, N. Y. on September 7 to 9 last. Some motion picture material was shown but the dominant feature for Biology teachers was a salon of still pictures and microphotographs made by leading biological photographers throughout the country. A second feature of the meeting was a complete demonstration of the new Ansco Color Process, showing the simplicity of the development of the color negative in the amateur's own darkroom, and the new color-printing method which yields color prints from color transparencies in one exposure step. Visits to the Ansco plant were a part of the program.

● The 56th semi-annual Conference of the Society of Motion Picture Engineers will be held at the Hotel Pennsylvania in New York City on October 16 to 18 next. It is expected to surpass even the record success of the 55th Conference in New York last spring, for it may be possible to offer special social attractions, necessarily missing at previous wartime sessions, which will step up attendance and interest still further.

● The OWI war film schedule is entering its third phase of production. The first phase concerned the home front—support of the war, stressing need for gas rationing, fat salvage, scrap metal saving, etc.—the second phase covered actualities of the fighting fronts—the third phase, already under way, will treat the problems of peace, treatment of wounded soldiers returning to civilian life, the functioning of Lend-Lease and the UNRRA, and steps in setting up international post-war plans.

● The business world long since realized the appeal and stimulus of the picture that moves. Far earlier than the schools, business recognized the "educational" potentialities of the movies and acted upon it. The school field followed, but from afar. Another example of swift progress by business—in the use of commercial short subjects for sales, training, advertising and promotion—is cited from a Film Daily survey. In 1940 only fifty (50) companies were using commercial shorts; in 1944 five thousand (5000) companies are using them, and with many production orders refused by producers for lack of raw materials and manpower. The school field could do well with only a fraction of such growth.

● Few fields of human activity are as prolific in statistics as the motion picture industry. Aside from the astronomical character of the figures evolved—e.g. the number of individual frames of film shown around the world in a year—they have endless capacity for change. They vary with each individual, firm or bureau doing the estimating; they can change not only from year to year and from week to week, but even within the same day; they are priceless subject-matter for the professional statistician for they can become obsolete before they can get into print. The U. S. Bureau of Foreign and Domestic Commerce has recently released its own careful compilations for 1943. The figures differ more or less widely from others previously reported on this page, but a few samplings may be given here on "the biggest business in history despite raw material restrictions, manpower shortages, and wartime loss of audience."

Total Investment, over \$2,000,000,000 (\$1,900,000,000 in theatres, \$126,000,000 in studios, and \$23,000,000 in distribution). Salaries, Production Costs, Advertising, Insurance totaled, in round numbers, \$360,000,000, \$247,000,000, \$65,000,000, and \$55,000,000 respectively. Personnel employed, 204,000. Theatres operating, 18,000, with seating capacity of 12,000,000 or "more than the combined populations of Sweden and Norway, etc., etc."

William F. Kruse

V. C. Arnspiger

Lt. Comdr. Francis W. Noel

## Sixth Midwestern Forum on Visual Teaching Aids

THE opening session of the Midwestern Forum was called to order on Friday evening, July 21st, at Belfield Hall, University of Chicago, by William F. Kruse, manager of the Films Division of the Bell & Howell Company. To initiate the program three Navy films were shown: "Principles of the Cathode Ray Tube", "Making a Sea Bag", "December 7th". Then followed a spirited panel discussion\* on "What can the Schools Learn from Wartime Uses of Visual Aids?" Mr. Kruse, as chairman, presented members of the panel: Lt. Comdr. Francis W. Noel, USNR, Officer in Charge, Utilization & Evaluation Section, Training Aids; Lt. Orville Goldner, USNR, Head Training Films Branch, Photographic Division; Wm. J. Hamilton, Superintendent of Schools, Oak Park, Illinois; Dr. V. C. Arnspiger, Vice-President of Encyclopaedia Britannica Films, Inc.; Floyd E. Brooker, Director of Visual Aids for War Training, USOE, C. R. Reagan, Head of Non-Theatrical Division, Bureau of Motion Pictures, OWI, Washington.

The chairman explained the informal procedure under which the discussion was to be conducted, and offered as "bait", several selected quotations from a much-discussed article, "Can Our Schools Teach the G. I. Way?" (*Better Homes and Garden*, Feb. 1944). The article lauded the "whirlwind techniques for impaling

ideas in the human mind", claimed that "bluejackets now learn more . . . from a 15-minute film than they had previously absorbed from a 2-hour lecture," maintained that "films have cut 40 per cent from 1917 training time" and indicated other phenomenal gains from the use of audio-visual aids on a large scale. The question was then put to the panel members in uniform, as to whether the article represented a true picture of the training program of the armed forces.

**Lt. Commander Noel:** On a number of instances where I have gone out to speak on occasions of this kind, I have tried to emphasize that the Navy is a *fighting* organization, and that its one job is to win—or help win—the war. We do training work because of the specialized nature of the tasks that must be done. If, in the course of our training millions of men, we evolve techniques of instruction that are different (regardless of whether they have any implications at all to American education) it is for the educators alone, of their own free will, to look into those developments, and for them to determine possible applications to American schools. . . . This article attempts to "popularize" some of the things that have been done in the armed forces, and the writer seems to have made fullest use of an author's privilege of not sticking too closely to the facts. For example, the claim that sailors learned so much in 15 minutes is at best a random shot. . .

**The Chairman:** Perhaps you can give us some data on actual gains?

**Noel:** There are certainly definite gains: increase in interest, greater clarity of thinking, better developed concepts, greater understanding, accelerated learning.

**Brooker:** While you have in mind no specific instances in support of the article, its purport is essentially correct?

**Arnspiger:** Would you say it is essentially correct or incorrect?

**Noel:** Essentially incorrect. This so-called "16mm. G. I. Way" is guided chiefly by people from American education. . . . As far as I know there have been no startling new discoveries in how to use these materials. We work under somewhat different conditions—adequate funds, terrific pressure for time, and the most powerful incentive known to man: self-preservation. With us the student has no margin for failure. You either know the right answer, or you are dead. Practically all of the Navy men and women in Utilization are people from your crowd. . . . We are using films by millions of feet, and other non-photographic visual aids, too, all the way from a little two-cent code blinker to highly complicated and expensive secret devices. We have training films on practically every conceivable subject that enters into Navy training. There is not a classroom in the Navy that is without a liberal supply of these devices—and they do pay dividends.

**The Chairman:** That is certainly positive enough. But the absent author tells us things our Navy men seem too.

\*The summary of the panel discussion given here is a condensed verbatim transcript.

Floyd E. Brooker

C. R. Reagan

William J. Hamilton

modest to go into. He maintains that, in the armed forces, "of all teaching aids the movie film is most versatile". He writes that "ninety per cent of all our learning comes through the eyes", that the Army is progressive enough to use cartoon strips for teaching, whereas schools shun them as "low-brow and moronic". He maintains, furthermore, that war training is more efficient than civilian education because it is based on aptitude tests, screening 11,000,000 men to find those best able to absorb education, grouping the faster-learning students so they will not be held back by the dullards. He admits that "the methods are not in themselves new", but that "the intensity of application to teaching is". Here are some questions that might suggest themselves to us: Should so much credit be given to the audio-visual methods *per se*? If so, would similar gains be scored in civilian education, if lavish funds and aptitude tests as a sole entrance requirement prevailed there as in the armed forces? What effect has the factor that uniform teaching prevails throughout the armed forces, whereas there are so many sectional and local differences in civilian education?

**Arnsperger:** I think the Army and Navy will agree that audio-visual aids have contributed more than any other factor to speed up the training program. But it is ridiculous to quote percentages and figures—like 90%—that is an assumption. This talk of 90% through the eyes and 5% through the ears seems pretty low on the ears—one might almost as well be deaf. . . . But if we go out to the Army and Navy where this training is done you will find men and women you

have known for 20 years, doing a good job of teaching. The better the job they did in civilian life, the better they do in the armed forces. I believe we *have* been teaching in the schools—for 25 years—much as the army is now teaching. The men in charge of the army program deserve great credit, but even their "great mobilization", bringing in millions of men in so short a time, is not without precedent in the schools. This is an annual event—the schools do that every year between Sept. 1st and 6th.

**Brooker:** Let's get this straight. Maybe I'm confused, but are we saying here that the writer of this article "exaggerated", and that really the army and navy are doing nothing that the schools have not been doing for years? That the armed forces are not doing it so very well, not nearly so well as they think they are doing it, or any better than the schools are doing—in fact the schools are doing all right and if education keeps on doing as it has been, then this is the best of all possible worlds, and we need not be disturbed by this magazine writer? Is that what we are saying?

**The Chairman:** Allowing you, too, just a little room for "exaggeration", by way of author's license, that is almost the way the discussion seems to be going.

**Noel:** No, we recognize that this is a challenge to American education. The Army and Navy have put into wide circulation, and into general adoption, the things we have long been talking about, whereas American education has been able to do these things only in isolated spots, on a few fronts. I think this is one of the biggest

Lt. Orville Goldner

challenges to American education.

**Chairman:** Do you think it is only a question of unlimited funds?

**Noel:** No.

**Chairman:** Do you think it is only a question of "Either you learn it or die"?

**Noel:** No.

**Chairman:** What is it, then? Where does the difference come in?

**Supt. Hamilton:** When I read this much discussed article, I was not particularly disturbed by it. When, later, a school journal held it up as a terrible attack on American education I could not help wondering if perhaps we were not taking ourselves too seriously. If we give some serious consideration to the possibilities of real improvement that can be made in practically all fields of learning as a result of our war experiences, we will find

something in the article that is worthy of thought by all men and women in education. There is one strong factor—that of motivation—that dominates in the educational processes employed in the army and navy. Education depends on the motivating ability of the individual teacher and of the administrators responsible for the educational program. We attempt some things in school work that we have not been able to do, despite our efforts to motivate them. For instance, in teaching arithmetic, there is a tendency to give credit on two bases—first, the ability to get the right answer, second, to recognize a pupil's use of the right process, even if he does not get the right answer. But in navigation as it is taught in the navy, there is only one acceptable answer, the right answer. If we could get that motivation into our arithmetic teaching, the factor of self-preservation that has almost gone out of teaching in the American schools, we would come closer to teaching "the G. I. way". This factor has gone out with the passing of the woodshed.

**The Chairman:** You mean, perhaps, when the boys *failed* to pass the woodshed?

**Hamilton:** When we decided to turn the woodshed into a garage, a great motivation was removed from American education. I wish we could bring in that element of self-preservation. Another element that should be given more consideration is that of competition. Still another motivating factor in the G. I. way which we do not have in the schools, is the element of pay. If we could pay even only 50 cents an hour for every child in the school, we would have more effort put into education. I am not so sure that on the question of instruction they are able to do so much better in the armed forces than we do in the schools. Many of those instructors were formerly in the service of the schools, and after the war is won a great many will return to the schools. If our school administrators are smart they will take full advantage of the training these people have received while working in the armed forces. There is also the matter of improved apparatus. Projectors we are using now are superior to what we had at the beginning of the war. Aptitude tests are important. We do use them in our schools, to a certain extent. They are not fool-proof but they do constitute a scientific approach that should be carried over from the G. I. way to our educational institutions. We can teach the so-called "G. I.

way", and I believe we are going to do it. Rather than criticize the writer of the article, we ought to be grateful for the stimulation he provided. And he did do that! (Laughter) We should watch out that we do not become impervious to stimulation.

**Brooker:** I am here as just another educator. For 13 years I taught school, starting in a one-room schoolhouse with 57 kids—and I got \$25 a year extra for chopping the wood and firing the stove in the winter. My last teaching job was in a high school with 4,500 students. As educators we may be doing a good job, but I am not so much concerned with just having the right methods as I am with getting the right answer. I wonder if, as educators, we have not been too satisfied just with having the right methods, and this raises the question of whether educators recognize December 7th in their own field. Were, perhaps, the establishment of the CCC and of the NYA admissions of defeat in public education? The Army and Navy men could give some very disquieting figures about the illiteracy and educational level of certain groups of trainees who came to them from our schools.

**The Chairman:** That seems to sound a different note. Closer to that of the much abused absent author—let's hear from him for the last time. He was not nearly as gentle with the schoolmen as Supt. Hamilton was with him. He charges that "With American schools, education is a two-billion-a-year job. Often it's just passing tests and playing safe and under-paying teachers and not letting the school board catch you drinking beer". He claims the Army can "teach unusually bright boys in one month all the important mathematics they get in the high school. The same is true of history and physics". He calls loudly for "something to breathe suspense and life into the cadaver of history teaching". He lauds the Army courses, where they have "no interest-killing drill on grammar, (nor) puzzling with rules on irregular verbs and past participles". He tells us that "The pre-war liberal-arts-college education was a leisurely way of killing four good years of a young man's life" with the result that "in the end you have nothing but sleek, well-tubbed animals with money in their pockets and nothing in their heads". He makes the claim that "With movies you can teach the first grade biological subjects which otherwise must be held off until the tenth—until the children have the vocabulary to understand". He re-

peats that "Edison predicted twenty-years ago that teaching films would supplant textbooks", and, just so that the school film makers would not get too cocky, he admonishes: "Don't compare teaching films with the still-born reels of your day . . . as the Army uses them they're full of slam-bang action and tremendous explosions and the crunch of the bone." And, this final compliment to the teacher—"It's tough on old Professor James, history 204, three credits, take a back seat and catch up on your sleep. It's tough, but there's enough evidence to hang him from the yard-arm of any school".

That should be enough from the author. The school people have been far more charitable toward him, and more generous in their praise of the fine job done in the armed forces too. Those teachers in uniform have done a fine job, and we can all be proud of them. They have done the same fine job that they previously did in their civilian classrooms, only on a bigger scale and under the different conditions that have already been pointed out. Theirs has been the job of inculcating individual skills and attitudes on the greatest mass scale our land has ever seen. But we have on our panel another man who has been concerned with a mass education program to develop and clarify attitudes on a truly vast scale: Mr. Reagan, of the OWI.

**Reagan:** Have we not really agreed that there is no such thing as the "G.I. way"? There was a rush war job to do, and the Army and Navy proceeded to use the most effective way to do it—the visual way. Educators have long agreed that visual aids, well made and properly used, accelerate learning and help get improved results. There is nothing new or revolutionary here except the urgency of the situation. Yet, able as our educators are, there are some problems that have not yet been solved. One of them is illiteracy. We have three million adults in this country who cannot read or write. We have four million between the ages of 19 and 37 who were not qualified to enter the armed forces. And what about the 85 to 90 million adults who admittedly know nothing about the meaning of reciprocal treaties, or the fifty percent of our adult population who do not know that we did not join the League of Nations? And what about the people who never vote? These are vital and pertinent problems that you and I have to face and solve in education, if we are to win this war and the peace that follows.

Some one has figured out that only

two per cent of the lifetime of an average person in this country is spent in formal schoolroom education. As a rule study stops when we leave school. From then on most of us learn only from what we hear on the radio, or what we read in the headlines, or the funny-papers. If democracy is to work we just have to stir up our people some way to keep on learning about the problems that face us, locally, nationally and internationally. As I see it, the one medium that will help most in this direction is the visual aids program, and particularly the adult motion picture.

We cannot depend on just teaching the children what to know to be good citizens. By the time they are old enough to vote much of what they have learned may already be no longer so. This is a fast moving world. When war came we had to get vital information to the adult population of our country, and we had to do it in a hurry. The multitude of problems raised by the war could best be presented to the whole people, it seemed to us, by means of 16mm motion pictures. Through this medium, long tested and proved in our schools, we could show the masses of our people why we fight—and how we fight.

We could show home problems and world problems, the nature of our foes, the war role of every civilian and of every soldier, and the relations between all these various fronts and factors. Many motion pictures were produced, some suitable, and some mighty poor, but we took them and began to use them all over this country. Wherever people met for serious community purposes, motion picture projectors were put to work, films were shown. Films of the type and purpose of the last one shown here—and if you observed the rapt attention here you can visualize the way the films did their job throughout the country. Where we want to impart information—and be sure of understanding of that information—in our adult population, in a hurry, the motion picture will do it.

**The Chairman:** The purpose of community showing of inspirational films is to stimulate thinking. It can be a diversity of thinking, if need be, just so it stimulates public-spirited interest and co-operative action for the winning of the war. This is not so in strict Army indoctrination films. But in the British forces, on the other hand, this same type of free-and-easy discussion of controversial current events is purposefully encouraged, on the old Cromwellian theory that the best soldier is he who knows and loves that for which he fights. To the best

of my knowledge that has not yet been done in the American armed forces.

**The Chairman:** On the matter of civilian training for war work, we have on our panel a real authority. Probably the world's best skill-training program by means of visual aids has been conducted under his direct charge, by the War Training Aids Division of the United States Office of Education.

**Noel:** Before Mr. Brooker speaks, I just want to observe that we are all out to see what can be accomplished with skill-training films.

**Arnsperger:** Another thing I would like to say is that we have learned very definitely from the Army and Navy how to integrate the various types of visual aids—films, slides, printed materials. It seems we have a better insight as a result of the war training experience.

**Brooker:** In April, 1941, the U. S. Office of Education started to make training films. In June of that year I was kicked out of one of the biggest shipyards, and the cameras came out with us; they would not allow us to take any pictures. In September of that year the head of one of the divisions of a major government agency said that this was one of the craziest things he ever heard of in the realm of education. I could go on and on with stories of this kind.

But by November of that year, a month before Pearl Harbor, we had 18 films on the market and now, as of today, we have 147 films out in use and 350 more in production. They range all the way from how to paint a mower to taking apart stabilizers, from the operation of large smelters to the use of a drill bar—in fact, they cover the whole gamut of the use of tools and materials essential to the winning of the war. There are 30,000 prints out now, and they will continue at the rate of 10,000 a year. We have used enough film, 16mm and 35mm, to go from here to Hawaii. We have made millions of slides, many of good quality and many not so good. But when you consider that there are 20,000 school districts in this country, with about 87,000 school buildings and that we have supplied 7,000 or 8,000 with our materials, you will agree we have so far supplied only a drop in the bucket. We were kicked out of one shipyard. But I have a letter from another yard which tells us that our 10 films on shipbuilding alone are the equivalent of 400 men. Maybe this is exaggerating a little, but one of the training directors faced with the job of building ships with men still green from the corn and cotton fields, said that "In January 1941 we had 40,000

men in the whole country employed in shipbuilding, whereas two years later we had a count of 685,000." Where do you suppose these 645,000 additional men came from? They had never seen a shipyard before, yet here they were building ships.

Every month about 70,000 men are being released by our armed forces. They are not released because the war is over; they are out because it is over so far as they are concerned. They are handicapped. I wonder if that has any implication at all for public education. A second point—I am sure that we are all amazed at how much geography you have to learn from the war communiques. I once taught geography, but I am learning all sorts of things that I had never seen in the books I had at school. I can tell you all about Bucephales, the horse that Alexander the Great rode, and about the temple designs of Carthage and Luxor. But I cannot tell you much about the history of China, of Burma, or India, the 18th century trend of history in Germany, or the tendencies of the Iraq government. Could our education, I wonder, be at fault? The war itself is a wonderful challenge to education—and we face still bigger problems at the end of the war. Education is going to have to change—in some direction—and we will have to learn which and how, somehow.

**Noel:** I stand squarely behind my earlier statement that there was very little new in what Army and Navy have done in developing films that American educators have not done before. Specifically, for instance, the USOE proceeded in the development of the training films that Mr. Brooker heads up, by translation of information into forms that facilitate the development of skills. And they did this before the army-navy training program came into being. Here and there across the far reaches of our continent there were educational people of vision who, in their small way, were doing some of these things. Some of these people at least are in the armed forces. The Army and Navy had a job for these educators to do, but even so, results had to demonstrate value. But now it has been begun, and has been put into effect on a broad scale.

In civilian education, too, we are challenged by a job to do. What is American education going to do about it? We are not spending even one cent per pupil per year in using these aids. Does American education have the leadership, the courage to go back to its patrons, the taxpayers, the

Boards of Education and other control bodies, to say, "Look, here is what has been done with visual aids in the winning of the war. We can do a comparable job if we get even one-hundredth the support that industry has had, to say nothing of what the armed forces have had. Just back us up!

**The Chairman:** This has been a lively and fruitful discussion, and we owe a vote of thanks not only to our vigorous panel members, and to our stimulating and co-operative audience, but also to the unseen author whose heckling has contributed no little to our program. Perhaps we can summarize our findings and come to general agreement on the following five points:

- 1) That the armed forces have done a fine educational job;
- 2) That they have made an intelligent and effective use of audio-visual materials and techniques on a scale and under conditions never before equalled;
- 3) That Society as a whole will profit, first, because this has helped shorten the road to victory, and second, that it has raised the educational level of a great mass of our citizen soldiery;
- 4) That civilian education especially will profit, from the extensive material (and the better trained and experienced personnel) it will inherit, and from an unprecedented universal acceptance of the whole idea of visual education.
- 5) That the "G. I. way" presents a healthy challenge to which every educator worthy of the name will respond with vigor.

**Reagan:** There is one question that bothers me. The visual instructionists have made an extraordinary effort under the urge of the war—but how can we find an equivalent stimulus to carry us over into peacetime? How can we accelerate the use of the present visual aids, and get the school boards to appropriate money with which to continue to do the job?

**The Chairman:** Has anybody the answer, or perhaps part of the answer?

**Brooker:** Perhaps you will have to go to your school boards through your civic organizations or your business interests. The story of visual education can be more strongly presented now by showing what our military services have done in this field. Many school administrators hesitate to ask their board for money. Maybe they need you to tell them how to do it, or perhaps you will have to go to John Q. Public himself to get your support. These teachers who have gone into

the army (and many of them are coming back) can go to their superintendents and say, "Mr. Jones, we did so and so in the service with visual aids. What can we do here?" If the superintendent is not impressed, the teacher may have to keep his mouth closed, if I may use that expression, to retain his job. In such a situation the only solution is to go to the public, to the man on the street, to get him to understand what visual aids will do for him and his youngsters, he in turn can convey it to the school board, or the superintendent.

**L. C. Larson:** I wonder if there are not three distinct points with respect to finances. One question that can be raised is whether we have resources to provide this aid to the schools. Another question is, do we have the personnel to do the job for the schools. If the answers are "yes", the third question we must ask is, "How about the postwar period, will we have closing down of factories and millions of men unemployed?" I think the answer there is "No." By virtue of this urgent need we face, to disseminate information, we will need to use all our resources. If organized education in this country doesn't do it, during the post-war period, we will have to do it on a government basis, along lines similar to the CCC and NYA. A question of this kind should provide a sharp stimulus as far as education is concerned, where we want to have local initiative with state supervision.

**Noel:** I would like to know what American education can do to make this visual idea spark like it did in the armed forces. Naturally, we had to prove its value, but the thing somehow took hold and it really sparked. What can we do? What are the set of circumstances that perhaps the school people might help to develop which in the next few years would make this thing click intelligently and with proper direction on the part of educators?

**The Chairman:** Perhaps part of the answer is to be found in Reagan's suggestion for a broad community discussion program based on motion pictures. This embodies also the thought that the school must build the social bridges of the community it serves. One of the best methods to do this is by free discussion meetings based on motion pictures that summarize the thing or action under discussion. Too many schools have fallen into the habit of looking upon the use of their plant and other facilities as sort of a business enterprise confined strictly to teacher, and pupil, whereas the school, historically, in this country is really a vital

social center. As soon as it assumes or resumes that function its appeal for community funds will be greatly strengthened.

**Donald Bean:** I would like to ask Lt.-Comdr. Noel how many men in the navy are engaged in training aid work.

**Noel:** You would have to include most of the instructors. I really don't know their number. Also the production people. In "utilization" alone we have a staff of over a hundred top-notch men and women most of whom have been connected with visual aids in American education in years gone by.

**Bean:** I am asking how we could use all this experience. I wonder if there is some way those men could be transferred to responsible positions in education, after the war.

**Noel:** We hope those men will be available for school jobs in years to come. Most of them are now on leave from educational jobs. If John Jones has been a Navy teacher actively using these visual aids, and he comes back to civilian school work and finds those aids aren't there, and funds aren't there, he will say, "Why can not we do that?" I think there are millions of service men who have been trained with these aids and who are going back into American life to say to the school board members and other leading citizens, "Look, in the armed forces we learned to do our job better and faster through the use of training aids such as motion pictures, and now we want the benefit of those films for our youngsters. We don't want them to sit through all this talking about history, we want them to see it." I have a feeling that some of the school people will find it necessary to anticipate the determination the returning service man will have for the use of advanced techniques in education.

**Audience Member:** In trying to develop a visual aids program, I find it pretty general among the older teachers that they are scared to death of using motion pictures for fear their class will get away from them. They don't know how to use these aids and feel lost when confronted by them. I think we face a real job in training particularly the older teachers, who lack the mechanical skill and experience necessary to operate projectors and handle films.

Secondly, I think there is a dearth of film in certain areas of our general education that has to be taken care of somehow.

**Elizabeth Goudy:** What about the large number of teachers in our

(Continued on page 308)

(Left) Transportation Corps men, in training at Fort Sam Houston, Texas, assemble to view a training film on the Radiant Daytime Shadow Box Screen, which makes it possible to use films out-of-doors.

(U. S. Signal Corps Photo)

(Below) An Air Forces mechanic consults photographic "exploded views" contained in his service manual before tackling a maintenance job. These illustrations, which show photographically the exact relationship of parts in vital war equipment, are used in instruction manuals of the armed forces to eliminate guesswork and "tinkering". Using this type of visual aid, Jack Butler, 11-year-old Chicago "Whiz Kid", assembled an aircraft carburetor in less than two hours in a test conducted by Bendix Aviation Corporation.

(Below) Sunday dinner at the Venards with service men and two soldier-brides as special week-end guests. For their hospitality to service men, Mr. and Mrs. C. L. Venard of Peoria, Illinois, distributors of Victor 16mm equipment and producers of rural education films, have been awarded "the orchid" by the national radio program, "Breakfast at Sardi's." Living near Camp Ellis, the Venards have converted their home into a free week-end "hotel" for soldiers.

# The Film and International Understanding

## Films for Understanding in the Invasion

DR. JOHN E. DUGAN, Editor  
Haddon Heights, New Jersey, Schools

NOT only were films used to prepare our troops for the job of invasion, but they also were used to build up confidence and understanding in the civilian populations of liberated areas.

### Movies Help Airborne Troops in Invasion

Chester Wilmont, correspondent for the British Broadcasting Corporation, tells how motion pictures were used to help prepare our airborne troops. "From aerial photographs the army cartographers constructed the most detailed and accurate models of the sector where the airborne attack was to be made, from the coast inland. It was an exact model, even to the height of trees.

"The Royal Air Force borrowed this and used it to make a film. I have seen this film. It gives you the impression of flying over the very coast of France. But in fact the movie camera is merely traveling over the model along the exact route the aircraft will fly.

"It is far better than studying ordinary aerial photographs. Through this film you saw features and landmarks as they came into view. You learned what to look for and when. After the crews had seen the film twice with normal light, it was screened again through a blue filter which gave a faithful representation of moonlight conditions.

### Films for Understanding

At the same time that this training activity was being followed, a reserve of appropriate motion pictures was being built up in England to be moved across the Channel with the other materials of war. In cooperation with the motion picture industry, the OWI had ready forty Hollywood features with superimposed French titles, a complement of short subjects and twenty OWI documentaries for showing in France. In addition, there was a seven-reel news review, narrated in French and designed to bring the French people up to date on world happenings since the Germans marched in.

Among the first films to be shown was *Salute to France*, written and produced by OWI. In it the liberated people see their own story enacted on the screen. An English version of the picture was available for showing to American and British soldiers.

Col. E. L. Mumson, Chief of the Army Pictorial Service, has reported that the first film was shown on the Continent on June 16, ten days after D-Day. The first movie convinced the French peasants that the Yanks were there to stay, according to Catherine Coyne's dispatch to the Boston Herald:

"It took them a couple of days and a few demonstrations like the movie show to make up their minds we weren't being shoved out of France", commented Lt. M. J. Anderson, Jr., of Santa Ana, Cal. "At first

the people in the cafes kept reminding us of Dieppe as though cautioning us not to be too cocky and perhaps reminding themselves that it wouldn't go so well with Jerry if he were to come back and find them with our francs. Then the special services officers came in with the movie equipment," and confidence and entertainment were re-established at the same time.

### Penn State Latin-American Students Make Film for Home Folks

Three Latin-American students at the Pennsylvania State College, State College, Pa., have made a short film which they plan to circulate in their own countries to help bring about a better understanding of the United States.

The film, which is in color, shows the Fourth of July community parade in the town of State College. Included among the marchers are boy scouts and girl scouts, Legionnaires and Veterans of Foreign Wars, some in the uniforms of this war, drum and bugle corps, high school band, uniformed volunteer fire companies with their apparatus, etc. It is a colorful presentation of the parade and the community groups which take part in such a celebration.

The students explained that people in their countries would be interested to see the colorful pageantry of one of our national holiday celebrations, just as we would be interested to see one of theirs. At the same time, the film will bring to them more than just a picture of a holiday celebration; for it will call attention to the groups which take part in such an event and will help to give an idea of this phase of community life in a town of this size in the United States. Even the shots of the main street with its buildings and the crowds of people lining the sidewalks to watch the parade will be of interest and help to fill in the picture of the community.

The picture was pre-viewed and approved by one of the college classes in visual education. The film was financed and photographed by the Latin-American students themselves. They also have made supplementary shots showing scenes of the campus and college life in color.

### Films Follow U. S. Troops in France

Motion pictures are keeping pace with our troops in France despite difficulties, reports Lt. Colonel Sidney Lund, who has just returned to the United States from a tour of the French invasion coast. In one instance, a courier with a shipment of films spent three days trying to catch up with General Patton's headquarters. Frequently the films are shown within a few miles of the enemy lines. There are 700 projectors in use in France, according to Colonel Lund, and audiences range from 80 to 500.

# Decentralization of Cities --- In Hand-Made Lantern Slides

By ANN GALE

Roosevelt High School, Chicago

THE congestion in our large cities and the need for rebuilding bombed European cities has started a movement toward decentralization of urban areas. The following slides may introduce six aspects of this for civics, home economics or art classes.

1.) The growth of the commercial area in the heart of the city has encroached on living quarters and created a slum section.

2.) The unplanned response to this crowding in most cities is the development of suburbs or dormitory areas outside of the city. The slide shows Chicago suburban areas.

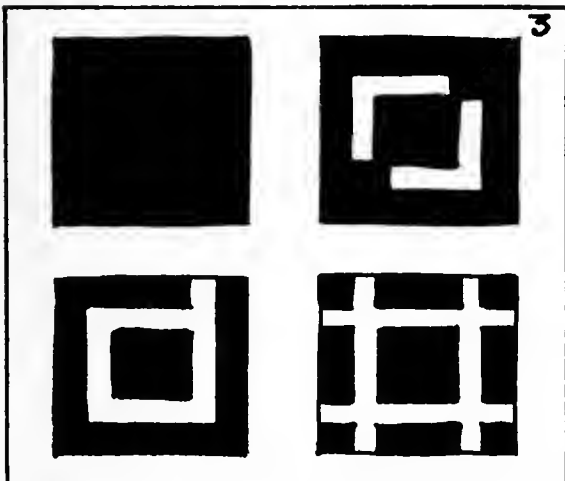

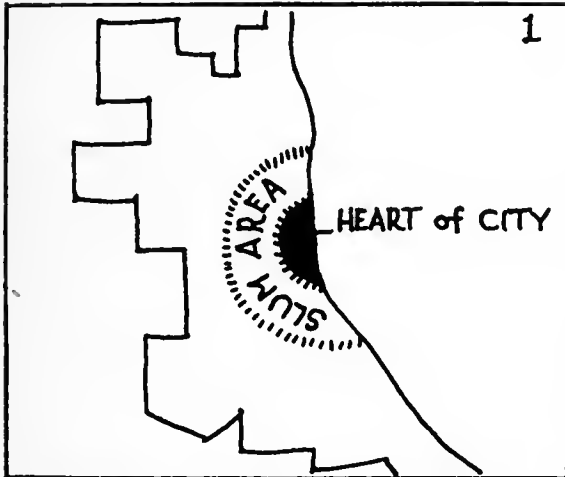

3.) Competent town designers think that the decayed slum area may be revitalized by rebuilding well planned units with large areas of space around them. They feel that industry should be removed if necessary and localized into

communities with the workers living in the neighborhood. Each part of the metropolitan area should be separated by park land. This slide shows the way such a development may start by showing first a congested block, then two areas of building surrounded by space and finally the nine buildings free-standing.

4.) The old gridiron plan of city streets has been abandoned by modern designers because the most beautiful old towns grew naturally—like cell growth. This slide shows the plan of a medieval town.

5.) Informal balance rather than formal is now used. The arrangement of the temples on the acropolis at Athens is informal.

6.) Modern city designers plan to relate the whole group of buildings and the space created by their arrangement.

The simplest type of hand-made slide is made by drawing or tracing on finely finished etched glass with ordinary medium lead pencil. Color, by special crayons or inks, enhances the slides greatly. Fine effects are obtained by blending with crayons. About one-third inch margin should be left all around the slide. The slide is readily cleaned with soap or washing powder to receive a new picture.

# Twenty-five Years of Film

Twenty-five years is a long time—a quarter of a century—and on January 1, 1945 Bertram Willoughby, President of Ideal Pictures Corporation, will celebrate his 25th year of service to the school field with the best in motion pictures. From one small office and a modest library of films in 1919—of course they were solely 35mm silent films then—the company has grown to be the largest 16mm film rental library in the world, with a total of twelve offices and exchanges strategically located throughout the country.

As we approach this 25th Birthday, and at the beginning of this new school year, we pledge our continued all-out efforts to maintain our service at the same high standards which have characterized it and with which our thousands of customers have become familiar, during this past quarter century.

## SILVER ANNIVERSARY CATALOG Now Available!

If you have not yet received your copy of this big, new Silver Anniversary Catalog, be sure to send for it at once. It is yours for the asking. Here are four catalogs in one, consisting of four distinct sections as follows: General Catalog of 16mm Sound Subjects; Religious 16mm Sound Subjects; Educational 16mm Sound Subjects; 16mm and 8mm Classified Subjects. The educational short subjects alone occupy 20 pages, grouped under the following headings:

Recess Programs  
Adventure  
Agriculture  
Animal and Marine Life  
Art and Architecture  
Astronomy  
Athletics and Sports  
Aviation  
Bird Life

Current Events  
Electricity  
Famous Personalities  
Geography and Travel  
Handicraft Teaching  
Historical  
Human Relations  
Industries & Industrial  
Education

Insect Life  
Juvenile  
Law Film Lectures  
Literary  
Musical  
Plant Life  
Physical, Popular, Natural  
Science & Chemistry  
Safety and Health

U. S. Government Films  
British Films  
Canada at War  
Our Fighting Navy  
War Incentive Films  
War Featurettes  
Civilian Protection &  
War Shorts  
Free Industrial Films

# Service to Schools

Our extensive film rental library contains the latest and best Major Studio productions made available in 16mm sound. Those listed below are but a few of the many subjects increasingly used by schools for curriculum enrichment in the study of Literature, History, Biography, Human Geography, Science, etc.

## ADVENTURES OF TOM SAWYER

A thoroughly delightful screen version of Mark Twain's immortal and unforgettable story. With Tom Kelly, May Robson and Walter Brennan.

## AS YOU LIKE IT

Two of the screen's foremost artists—Elizabeth Bergner and Laurence Olivier—play the leading roles in this notably fine production of Shakespeare's comedy.

## BECKY SHARP

"Vanity Fair", Thackeray's famous classic about a thoroughly selfish woman, brought to the screen in Technicolor. Miriam Hopkins in the title role.

## EDGE OF THE WORLD

A stirring, human document on the struggle for existence by a strong, hardy people, living on a desolate island off the northern-most tip of Scotland.

## EXPLORERS OF THE WORLD

A thrilling travel and adventure film in Asia, Africa, South Seas, the Antarctic and Amazon region.

## JACARE

Produced by Frank Buck. His authentic, exciting adventures in the wilds of the Amazon jungle.

## LIFE OF ROBERT BURNS

The poetic genius and life of the great Scottish bard depicted in a telling and entertaining manner. Andrew Cruikshanks as Burns.

## LITTLE LORD FAUNTLEROY

Frances Hodgson Burnett's warmly human child story masterfully produced. Freddie Bartholomew in title role.

## THE MELODY MASTER

An appealing film based on the life of the great Austrian composer, Franz Schubert, with many of his best known and loved compositions played and sung. With Alan Curtis and Ilona Massey.

## PRISONER OF ZENDA

Anthony Hope's romantic tale of a by-gone century, beautifully produced, excellently acted by Ronald Colman, Madeleine Carroll, and fine supporting cast.

# The Literature in Visual Instruction

## A Monthly Digest

ETTA SCHNEIDER RESS, Editor  
New York University Film Library

### POSTWAR PLANNING

- **Postwar Changes in the Curriculum and in Instructional Materials**—William C. Reavis and Dan H. Cooper, University of Chicago—*Elementary School Journal*, 44:583 June, 1944.

A group of school superintendents in the Chicago area was polled to find out what changes are needed in the curriculum to meet new objectives. There were 17 superintendents involved. Included in materials of instruction were: textbook and workbook materials, several reference books, supplementary reading materials, visual aids, better trained teachers with greater background on the various subjects under consideration, etc.

Almost general agreement was given to the statement that visual aids should be consigned as essential materials of instruction; that teachers need special instruction in their use; and that they are especially needed where the subject is abstract and difficult of comprehension.

- **Films for Tomorrow**—J. Margaret Carter, National Film Board of Canada—*Church Property Administration*, 8: no. 4 p. 26-29 July-August, 1944.

Closely allied to the great educational task which confronts us after the war is the motion picture, which is a masterful means of solution in the class room and the community group. The increased use of the 16mm. sound projector, with the hundreds of men and women who have been trained in its use in the services, and a skilled corps of educators will inevitably bring about the production of pictures of greater technical excellence built around themes of fundamental significance.

There will need to be careful selection of films in terms of the specific need and the group to be served. The life of people in other lands, for example, is not adequately seen through travel films of public buildings. Instructional films for the classroom must be carefully planned, presented and reviewed. Films will become available in new and unexplored areas, as vocational guidance, especially for the education of returned servicemen.

Most of our people, too, will want films that keep them informed on current problems. The documentary film must serve this need. It cuts through to the core of realism in clean sharp strokes. All the drama, the pathos, the tragedy, the fear, the triumph of life itself are unveiled on the screen.

Producers of the films of tomorrow will be: those who are interested only in instructional films, government agencies that will produce significant documentary films, and sponsored films on scientific subjects. Distribution will be through the school systems, through regular film libraries, or through the public library.

### LIBRARY AND FILMS

- **An Educational Film Service Is the Library's Responsibility**—Hoyt R. Galvin, Director, Charlotte, N. C. Public Library—*Library Journal*, 69:637 August, 1944.

The film program in Charlotte began with the distribution of the Civilian Defense Training Films. Film circulation has since grown to two-thirds of the book circulation.

Although the library has an auditorium where films are sometimes projected, the most successful feature of the service has been lending films and projectors for use in churches, schools, clubs, etc. Hundreds of borrowers have been taught how to use the library's projectors and the result has been satisfactory.

To start a film program simply buy a few films and begin lending them. The rest will be learned by experience.

As soon as it was learned that films are available without charge, circulation grew rapidly and a surprising number of projectors began to be put to use in the city. Most loans are for films alone, without the projector. Equipment must be booked in advance, usually by phone. A monthly mimeograph lists new films available.

The films are purchased from the book budget. The collection includes OWI, CIAA and high-quality commercially sponsored films that have been placed without charge. Where necessary, the inter-library loan service is extended to include rental of films that are only needed for one use. Rental cost is paid by the borrower.

The only publicity used was a trailer attached to each film, telling of the Library's free film service. The library will splice together a program of short films for a continuous showing.

- **The Library's Place in Film Distribution**—Eva Rahbek-Smith—*Wilson Library Bulletin*, 18: 743 June, 1944.

Film distribution should naturally accompany book distribution in providing information for the public. Public libraries that now handle the circulation of films are Cleveland, Dallas, Beaumont (Tex.), Kalamazoo and Ventura County (Cal.).

### FILM DISTRIBUTION

- **Freedom for News Films**—L. C. Larson—*The Christian Science Monitor*, July 27, 1944

An abstract of an address on "War Department Abridges Freedom of the Non-Theatrical Screen," given at the Allied Non-Theatrical Film Association, was reprinted on the editorial page of this Boston newspaper, probably because any restriction of freedom of the screen is regarded as closely akin to limiting freedom of speech through the newspaper.

The address is a protest against the continued policy of the War Department in distributing the war films under its jurisdiction. Whereas the OWI and the CIAA have arranged for the maximum distribution of their films by placing them in about two hundred depositories throughout the nation, the War Department has limited distribution to three commercial companies.

Under the terms of the War Department's agreement with these companies, a State War Council, university, public library or school with a film library could be denied the opportunity to serve as a depository unless the agency agreed to pay to the distributor holding exclusive rights to the territory up to \$1.00 for each booking of three reels or less. This interferes with the right of the user to select films from the film library that he has been dealing with satisfactorily. Instead, he is compelled to go to the nearest sub-dealer of the distributor holding exclusive rights.

This arrangement for the distribution of official war films, (which include the orientation, incentive and news communiques) thus abridges the freedom of the non-theatrical screen.

### PHOTOPLAY APPRECIATION

- **The Theater-Shown Film**—Charles S. Steinberg, New York—*School Executive* 63:49 May, 1944.

The school child's "Saturday afternoon at the movies" has unrealized educational possibilities. The schools should select relevant theater-shown films and develop interesting units of work based on these pictures.

The current feature film "Adventures of Mark Twain" is an illustration of such a motion picture. There are teachers' guides available to help in applying the film to the curriculum.

**another helpful series of  
CORONET  
"PICTURE STORY"  
SLIDEFILMS**

Scene from the first Picture Story  
"China's Home Front"

**8 SLIDEFILMS** (About 200 Pictures) **\$2<sup>00</sup>**

The non-profit visual aid service offered by Coronet Magazine last year received such enthusiastic acclaim that it will be continued through the coming school year.

This service makes available, on slidefilms and in reprints, selected subjects from the "Picture Story" section of Coronet Magazine—ideal for schools, clubs and churches.

The slidefilms, produced by the Society for Visual Education, Inc., can be shown with any standard 35 mm slidefilm projector. (S. V. E. Projectors are again available.) Titles of three of the eight subjects are given below. Succeeding subjects will be announced later. The eight slidefilms will cost only \$2.00. Reprints of the "Picture Story" cost 1c each with a minimum order of 25.

**THREE OF THE EIGHT SUBJECTS**

"China's Home Front"—vividly presents the agriculture, commerce, industry and home life of our courageous far-eastern ally. To be released in October.

"Miracle of Moscow"—presents the inside story of the organization that has given the Soviet armies their morale and tremendous driving power. To be released in November.

"Glass"—(In glorious technicolor)—portrays the history of glass-making from the earliest days. Release date to be announced later.

### FILM FORUMS

- **San Diego Community Film Forums, 1944**—Harold B. Allen, Asst. Director—USO Industrial, 1115-8th Ave., San Diego, California. 25 p. mimeo.

A report of a USO-YMCA venture into the field of informal adult education in San Diego. From Feb. 6, 1944 through June 11, 1944 the USO Industrial sponsored nine rounds of film forums in fourteen different neighborhoods. The attendance of war workers and their relatives and friends at the 97 forum meetings during 18 weeks totaled 3066, an average of more than 31 at each meeting.

Before the start of these 97 forum meetings, considerable planning and preparation was necessary. There was a training course for discussion leaders, and a trial forum series of seven meetings under the chairmanship of Mr. Allen at the community church. The audience averaged 97 persons at these meetings. They expressed themselves as in hearty agreement with the use of films as one of the methods of stimulating discussion. Symposiums, panels and combination film panels or film symposium were used.

The Film Forums which followed this experimental period were administered through a central committee, the Informal Educational Council, and local committees.

The report gives an interesting account of the nine film forum "rounds" that made the circuit of 14 neighborhoods. The problem of pressure groups and how to cope with them arose in connection with the forum on cooperatives but the forum on the Negro problem met with enthusiastic response by mixed audiences.

The author concludes that documentary films can do much to promote discussion, but that there is still a dearth of such films. He also recommends the integrated film forum program whereby several meetings are held in contiguous neighborhoods to bring down the cost and improve planning. He found the use of a local committee very valuable to the success of the program, even where the school system assumes leadership.

A similar series of film forums will be given during the coming year in new locations.

### MAPS

- **World Maps and Their Contribution to Global Understandings**—Ella Callista Clark, Winona (Minn.) State Teachers College—*Minnesota Journal of Education* 24: 365 May, 1944.

The globe gives the only true picture of the earth, portraying global relationships as they actually exist. It is an essential piece of equipment in the schoolroom. Maps are also a necessary supplement to teaching, even though no flat map of a large area of the world is accurate in all respects; each is necessarily distorted, yet at the same time each presents accurately some fundamental facts. If correct interpretations of world maps is to be achieved, it is necessary to consider that maps are tools made for specific purposes, and the appropriate map should be selected to convey certain specific information, keeping in mind the limitations of that particular map. The advantages and limitations of the various map projections—Mercator, equal area maps, Aximuthal or Polar equidistant maps—are explained. The use of maps can lift what otherwise might be a dull lesson to the plane of living reality. They are especially important aids today in following the significant major happenings in the world conflict.

### EVALUATION

- **Evaluating Audio-Visual Aids**—Elizabeth Goudy and Lt. Francis W. Noel, USNR—*The Business Education World* 24: 438 April, 1944.

Evaluation of audio-visual aids may be as simple and immediate, as judging whether the sound is too loud, or it may be complex and intangible such as judging whether students' attitudes changed or their skill improved as a result of using a particular film. It is the aim of this article, the concluding installment of a series, to present some ideas to help teachers think through the matter of evaluation and to systematize the evaluating they do.

Previewing should be the basis upon which the teacher determines whether to use any audio-visual learning aid. After selection has been made, the next step is to consider the effectiveness of utilization. A few questions are given to help in this evaluation. Suggestions are also presented for determining what the students learned as a result of the utilization of audio-visual aids. Evaluating is an essential element of the teaching-learning situation. It assists a teacher in analyzing the job just done so that he may do the next one better.

### RACIAL UNDERSTANDING

- **Educational Programs for the Improvement of Race Relations; Motion Pictures, Radio, the Press and Libraries**—L. D. Reddick—*Journal of Negro Education*—13:367 Summer Number, 1944

The most comprehensive and significant summary ever written on the influence of current motion pictures and radio on our attitudes toward the Negro. The article is part of the Yearbook Issue, "Education for Racial Understanding", published at Howard University, Washington, D. C., for \$2.00.

The author made a check list of important films shown in the U. S. which included Negro themes or characters. There were 100 such films, of which 75 must be classified as anti-Negro; 13 as neutral, with equally favorable and unfavorable scenes; only 12 as definitely pro-negro. The story of the film industry's point of view about negroes is told chronologically. There is an extended and authoritative discussion of the "Birth of a Nation" and its portrayal of the Negro. Other important films in terms of racial understanding—or misunderstanding—were "Imitation of Life," "Gone With the Wind" and "Tales of Manhattan."

The author makes an appeal for good educational films about Negroes, and the production of more and better films by Negroes.

### HANDBOOKS

- **How to Use Training Films**—Training Aids Division, Office of the Assistant Chief of the Air Staff, Training, Headquarters Army Air Forces, One Park Avenue, New York 16. April, 1944.

A brief outline of the techniques involved in using training films. The bulletin is well designed and uses photographs, diagrams as well as concise phrases to convey facts. Utilization is defined as involving preparation (of the lesson, of the classroom, and of the class); presentation; and application.

Points to remember include:

1. The instructor and not the training film is the dominant influence in the lesson.
2. Plan the entire lesson carefully before showing the film.
3. Show only one film per lesson.
4. Films of a highly technical nature often require that they be screened in short sections in order for the trainees to understand the facts and operations shown.

- **Non-Theatrical Films: a Handbook for OWI Outpost Officers**—Non-Theatrical Division, Motion Picture Bureau, Overseas Branch, OWI. Limited distribution.

Although this handbook was intended for a limited audience, namely, persons in charge of showing informational films to the people of liberated countries, it has great interest value to film enthusiasts. The handbook gives in an interesting style some of the important items of information that a neophyte in the field would need to know: who the possible audience might be, how to plan programs for specific groups, how to arrange a film meeting. Practical considerations are taken up in the section which tells how to arrange a film distribution center for the maintenance of films and projectors, and in the one dealing with the actual film projection.

An annotated catalogue of some 300 film titles now available to overseas administrators supplements this handbook.

An unusual innovation in teaching methods

**THE NEW KEYSTONE**

# Overhead Projector

- A short-focus lens brings the instructor, the projector and the slide together at the front of the room.
- The slide is visible on the slide table before the teacher, which enables her to discuss its content while facing the class. When one slide is pushed over the projection opening, it pushes the previous slide off.
- The teacher can write or draw on the etched glass placed on the slide table and the development of the lines of writing or drawing is reproduced on the screen.
- Ideal for the use of the Flashmeter, as it makes feasible, through the use of a slotted screen device, the showing of individual words, phrases, or sentences from a slide consisting of several lines.
- The lamp house is air-cooled by a motor-driven fan, which prolongs the life of the lamp and prevents the breaking of condensing lenses and slides.

school film productions, conducted by*  
**DAVID SCHNEIDER**  
Evander Childs High School, New York City

## Flight Training Depicted in Film

**T**HE U. S. Navy V5 Flight Preparatory Training Program is the subject of an effective 16mm. documentary film produced recently at Wesleyan University, Middletown, Connecticut. The 400-foot color production depicts the experiences of an aviation cadet from the day of his matriculation until the completion of the course three months later, H. L. Connelly, Director of the Wesleyan University News Bureau, reports.

The film story opens with the arrival of the men at the university. It shows the neophytes being interviewed and examined. Following some shots of inoculations, the conditioning program is presented. Group exercises, sports, obstacle course practice and swimming are pictured. In swimming instruction, some interesting shots of drill in abandoning ship show the men learning to leap from the springboard and the high tower in the university pool.

A trip to the kitchen and the dining hall is followed by shots of classes, including mathematics, aerology, and physics. In physics, the teacher explains the gyroscope and principles of flight.

The recreational activities of the school are depicted by a series of shots of the recreational center with games, dancing and reading.

Concluding sequences of the film show the lowering of the flag, the graduation of the V5 class, and a regimental review.

Titles for the film were in the form of portions of letters written by a V5 student. Lester R. Bradbury, B. B. Doolittle, Lt. Donald A. Eldridge (former *Question Box* editor), R. J. Lillara, USNR, and R. T. Limbach made the film.

## Positions Held by Film Course Graduates

A recent survey of the graduates of the Department of Motion Pictures of New York University reveals that most of the graduates of the Department are engaged in unusual jobs in connection with motion picture production or promotion. In Astoria, New York City, seven former students are working at the Photographic Center of the Signal Corps. In the West, two students are in the Photographic Division of the Air Corps; another is a film editor in the Navy. In the Far East, one graduate is a combat cameraman. Five others are in photographic work in the Army.

Two students are working for foreign nations: one, for the Belgian Government, and another, for Russia. Other graduates are working for industrial and educational film producing and distributing firms in such positions as production chief, technician, production assistant, script clerk, script writer, and technical assistant. Still other former students are employed by MGM, Paramount, Universal, Twentieth Century Fox, Columbia Pictures, RKO, and Trans-Lux.

Congratulations are in order for Robert Gessner head of the Department of Motion Pictures, for his pioneering in establishing the department two year ago and for the success of his students. Educators who wish to learn film techniques should make use of the facilities of Dr. Gessner's school.

## QUESTION BOX ON SCHOOL FILM PRODUCTION

**QUESTION:** I am only a beginner in the field of motion picture photography. Would you be patient enough to give me some pointers in the proper use of Kodachrome film which I am planning to try.

**ANSWER:** The most important thing to know about Kodachrome film is exposure. In black and white film an under- or overexposure of two or three stops is often corrected by the manufacturer in the reversal processing. In Kodachrome film an overexposure of more than half a stop will destroy color values and result in washed out scenes. Similarly an underexposure will result in dark, almost black pictures, instead of the bright natural colors as they appeared to the eye at the time the scenes were shot.

If you have an exposure meter that's reliable, make use of it with every change of scene. If you have no meter follow the directions that you will find with your carton of film. As a simple experiment, before shooting any footage, watch the effect of sunlight at various times of the day on a certain landscape. If you observe carefully, you will become aware of the unusual amount of redness early in the morning or very late in the afternoon. You will be wasting precious film if you shoot at either end of the day. It's a curious trait of Kodachrome, perhaps psychological, that a projected unpleasant image is more annoying to the esthetic sense than the real scene itself. The only explanation I can offer is that in the real scene the eyes don't stop long enough to view the bad spot, but sweep across wider horizons—a trick the camera hasn't learned to do yet. Another explanation is based on the ability of the mind to adjust itself to color disturbances.

To go back to the landscape, shoot, if you must, in full sunlight. Avoid too many shadows. The colors in themselves will bring out the pleasing contrasts called for in good photography. A word of advice in connection with color film is to shoot the entire roll within as short a period of time as possible—two or three weeks at most. Do not fail to send the film for processing right after you have exposed the last foot. A long delay in either case will result in a collection of slightly yellowed scenes.

The most pleasing scenes in Kodachrome are those having blue as a background, therefore if you shoot with the sky as a background make sure the sky is a clear blue. In making a close-up of some one's hands or face avoid backgrounds that are flesh or red colored. Too much red, or for that matter, too much of one color occupying the entire frame soon becomes monotonous. Red and green form excellent contrasts, if red does not dominate the picture. Violet and purple are hard on Kodachrome—they darken the pictures. Be sure to use other brighter colors to light up the scene. Avoid photographing green with blue, since both are too near each other in the color scale. Red brightens up a picture, if used sparingly—

(Concluded on page 315)

• Dorothy asks her good friend, Dr. Benson, to also give her doll "before" medicine for protection against smallpox, diphtheria and whooping cough.

• A recent nation-wide survey by Elmo Roper showed a widespread failure by American mothers to have their children immunized against preventable contagious diseases.

Sharp & Dohme  
*presents*

## "A Passport to Health"

A dramatic new sound film showing how to free America's children from preventable diseases

HERE is a film which meets one of today's most crucial needs—the education of parents on the benefits of immunization.

"A Passport to Health" warns parents against the idea that it is better for children to "catch a disease and get it over with." It points out that the death rate from children's diseases is high; and after-effects are often more lasting than the disease. Whooping cough, for example, which many parents think is "no cause for worry," has a death rate nearly twenty times as high as diphtheria among infants under one year.

The movie weaves the information about immunization into the human story of a typical American family.

### Cast of Leading Broadway Players

Philip Ober, the father in "Junior Miss"—Frances Reid, Alexander Hamilton's wife in "The Patriot"—and 5-year-old Patricia Brady, delightful little radio favorite—head the sparkling professional cast of "A Passport to Health."

This splendid educational film, reviewed by The United States Public Health Service, is creating widespread attention and interest among health and educational authorities.

You, as an educator, have a special obligation to your community to help bring about more general immunization.

Right now—as school opens—is the psychological opportunity to interest parents in immunization.

Show "A Passport to Health" at your school. Ideal for P.T.A. meetings. But booking dates are in great demand—so be sure to mail the coupon three weeks in advance for *your* date.

*Available to schools at no charge except regular transportation costs*

## Midwestern Forum

(Continued from page 296)

schools who have no training in the use of visual material? What about the students who are going through teacher training institutions now who are not getting any experience in the use of visual materials? You teach most readily the things you are most sure of, you use methods with which you have had personal experience. Now, if you have had no experience with visual aids, if you have not been trained how to use them, it is quite natural that you will shy away from them. Teachers correctly trained by and in the use of visual aids will look upon visual aid material as an entirely customary part of their teaching.

**Arnsperger:** I don't think we should hold that the teachers coming in now should be excused for lack of training skill, after all they have come in after the thing has been established. I think we have to look to the civilian population for help because when the citizens begin to demand the kind of education they want, they will get it. I wish you could get the teachers' colleges to procure proper aids. Only when training in visual aids is demanded by our schools, will it become part and parcel of teacher training. There is really a lot more being done in teaching in the school today than is generally recognized.

**O. T. Bright:** I believe we have been asleep at the switch on this whole business of motion pictures and other visual training aids. Up to very recently there had not been very extensive buying for schools, the schools wanted film and projectors but couldn't get them. The statement was made that the schools are to blame for the lack of motion pictures, but I wonder if you have any conception of how many schools right here around Chicago are closing? They cannot get teachers because they cannot pay more than a thousand dollars a year. Where we ought to have at least \$2,000 or \$3,000 per classroom they get along on next to nothing. That is why we have not got those things in the very places they are needed most. We have had bills before the Federal Congress for almost my whole lifetime asking for a little help to broaden the educational opportunities here, but even if we had all the money the bill asked for I don't believe we would have enough to build half a dozen decent ships. If we could get even part of it we might offer the teachers ten bucks more and then maybe we could get a little more intelligent service at the end of the line.

**The Chairman:** What percentage of teachers and administrators favor that federal aid legislation? Are not some educational organizations on record against it, on ground of state's rights or local autonomy?

**Bright:** I think you will find that a great majority of the teachers are in favor.

**Reagan:** I did not mean to condemn the school people for either the status of ignorance or the status of wealth in this country. But I think that as a whole people we must do something about it. We should get our people to see how wasteful and mistaken it is to deny help to educationally underprivileged people, and then have to spend millions of dollars to cure the evils we could have prevented by spending a few thousand dollars on education.

As to motion picture projectors, if we could just make full use of those projectors that are in our schools, if we could lend-lease them, as it were, to our communities, and let the "Minute Men" do a little home front fighting by taking those projectors around to the men's and women's clubs to help sell war bonds and mobilize for other war activities, then we would at the same time help convince our whole community that this thing is valuable, and that we simply must have it and get moving right now.

**Noel:** Just because we put films into the schools, and because they are somehow shown on the screen, does not mean education will take place. If there is any one thing that has been proven by the armed forces, it is that these materials must be chosen in terms of curriculum needs—they must serve definite and legitimate educational objectives, must be used in terms of good instruction techniques, or you are liable to come out definitely with a negative product. Research work that we have been doing in the navy shows that there are definite losses if the material is not properly used.

**Bright:** According to a national resources survey for 1941 we spent around 3 billion on education in 1940, whereas to perform effective educational services we ought to have been spending six billion. But it also points out that on the basis of present day wealth taxable for school purposes we have reached our maximum. There is no use kidding ourselves, unless we can get more out of the taxes for school purposes we cannot get a program of a film a week for each class, because it will mean \$10 or \$12 per pupil and there are many places where this can not be done.

**J. S. McIntosh:** By way of supplementing Commander Noel's thought on the relationship of this field of visual aids to the curriculum as a whole, I just wonder how many educational meetings this fall, all over the country, will see visual aids playing any part at all in the general meetings. I definitely feel they should have a part.

**The Chairman:** We made one step forward in connection with this Midwestern Forum, when we joined our sessions to those of the very fine annual meeting of school administrators. Many have remained over for this conference. In due time we hope to do the same in various subject matter areas and among their supervisory forces. When we have visual aid sessions as part of those meetings we will all be much further along.

**L. L. Reed:** I can not believe that we are going to have any trouble in selling visual materials of the kind we have seen on the program, for we will be contributing to the enrichment of the knowledge and understanding with which teachers will want to acquaint their pupils. It seems to me that the school administrator will be interested in getting his teachers to equip themselves to supply the answers to all questions that the pupils will raise. The entire curriculum may have to be changed in many respects as a result of the changes that have taken place in this world, and our teachers will be alert to these changes and will want new material. It will take time to revise the textbooks. Any kind of aid that can be produced in a short time, to supplement instruction and enable the teacher to use newer material and to teach better, will be in demand. You will not have to "sell" that sort of thing at all, the schools will want to get it.

**Hamilton:** I would like to come back to the utilization of teaching aids in the classrooms. We can talk a lot about production of films and projectors, and teaching the GI way and so forth, but after all, the crucial thing is whether or not we provide for their actual use in a classroom situation. Probably our teachers are not as well trained as they might be. School administrators have some responsibility in setting up this movement, and if we all agree that in-service training is best, are not those of us who are principals and supervisors somewhat responsible for the proper motivation of teaching in the classroom? And, isn't it up to us to see to it that our teachers get in-service training, and have films in the school for ready use, and get

(Continued on page 310)

# DISPOSAL SALE

## of 16mm Silent Film Library!

We are discontinuing our film circuit operation and offer at a very special sale price our entire library of 16mm silent films, consisting of the titles listed below. With the few 2-reel exceptions noted, all are single reel subjects. All prints guaranteed to be in good condition, none having ever been out for rental. They include productions of such well-known producers as Bray, Castle, Bell and Howell, Eastman Teaching Films, Films of Commerce, General Electric, Frith Films, Gutlohn, etc.

## Midwestern Forum

(Continued from page 308)

direct personal supervision on the use of projectors? Most of our average 15-year old boys can use these new projectors and I think the teachers have the same intelligence.

**The Chairman:** The spirit of self-criticism shown by all the speakers has contributed much to our discussion. So has the audience in listening so patiently and in participating so actively. As the agreed adjournment time, already once extended by unanimous consent, has again been reached, the meeting stands adjourned.

## Visual Aids in Developing Inter-Group Understandings

THE addresses on the Forum's Saturday morning program were concerned with the theme: "The Unique Contribution of Visual Aids in Developing Intergroup Understandings."

Joseph E. Dickman, Director of Visual Instruction, Chicago Public Schools, opened the discussion with some brief remarks on the present importance of such problems of human living as social and economic relations, racial tolerance, and international understandings. The power of visual aids to speak a universal language, to reinforce words with reality, to use animation in demonstrating the abstract, to overcome limitations of time and space, plus their many other abilities so clearly demonstrated in the teaching of information and skills indicate possibilities for their use in the difficult field of human relations.

Mrs. Esther L. Berg, Assistant Principal, Junior High School 99, New York, described the use made by her and by other teachers in the New York Schools of the Human Relations Series of films. She indicated their value in motivating new attitudes by presenting problems in life situations, and in stimulating lively and meaningful discussion among the students. The Taylor Sequence from the film *Black Legion* was shown as an illustration of a visual aid useful in the field of labor relations.

Allison Davis, Assistant Professor of Education at the University of Chicago, spoke on the topic, "Understanding between Races." He dealt especially with the improvement of relations between whites and negroes. Pointing out the liberal attitude of most teachers in our public schools toward racial minorities and the underprivileged, he recommended that we use the school as a training ground for educating children in proper emo-

tional attitudes and racial understandings. The OWI film, *Henry Browne, Farmer*, was screened and its usefulness as well as its shortcomings, discussed.

In the field of international understanding, Wesley Greene, Director of Distribution of the National Film Board of Canada, followed the showing of the film UNRRA with a description of the effective use made by Canada of the film medium to improve its internal as well as its external relations. He urged the interchange of films between Nations and the post-war establishment of an independent international central film organization, equipped with a qualified staff, to act as producer and as a center for coordinating information. The use of films and other visual aids to present information to the people will bring home knowledge of groups' objectives in other parts of the world and will have great weight in reaching important decisions in the future. Such a movement, he stated, would speed up the educational program of all people.

In the general discussion which followed it was agreed that visual aids can make an important contribution in developing intergroup understandings. It was agreed, further, that teacher selection, evaluation, and interpretation of films were beset with greater difficulties and, hence, much more important in this area than in the field of standard instructional film.

## Visual Aids in Postwar Period Who Will Make Them?

MR. STEPHEN M. COREY, Professor of Educational Psychology, University of Chicago, presided over Saturday afternoon's program on "Visual Aids in the Postwar Period." In discussing the question, "Who Will Make Them?," Don C. Rogers, Assistant Superintendent of Schools, Chicago, pointed out that because of the specialized nature of classroom films, their production involves subject-matter specialists, educational experts, motion picture technicians, and business men. The most likely producers of instructional films in the future are Hollywood-type companies, the government, special interest groups, and private classroom film companies. He concludes that of all of these, the ones having the best chance to survive and win the confidence of the teaching field are the specialized private firms who will produce films solely for classroom use.\*

\* Mr. Rogers' address will appear in full in a subsequent issue of EDUCATIONAL SCREEN.

## Who Will Distribute Them?

Mr. L. C. Larson, Indiana University, outlined some important trends in the distribution of films in his talk on "Who Will Distribute Them?" He called attention to the need for special marketing organizations to fill the gap between the producers and distributors. Among the educational agencies who will provide a general film distribution service, he stated that schools, colleges and universities will play an important role. There are approximately 400 cities with a population of over 25,000, most of which he expects will have their own film libraries after the war. Even though schools in cities with a population as low as 10,000 purchased prints of a limited number of films, approximately 50% of our population will still need to obtain their films from nearby educational or commercial film-lending libraries. During the past seven years approximately 100 colleges and universities have organized film libraries, and he believes this trend will continue. In order to acquaint teachers with films available on the elementary and secondary levels, he recommended that teacher-training institutions own films on those levels. These institutions, in order to maintain film libraries adequate for training and research purposes, will initiate the lending of films on a service charge basis to schools and adult groups in the immediate area, in addition to meeting campus demands for films.

Public Libraries, Mr. Larson predicted, will also play an important part in film distribution, particularly in the larger cities. They will make films owned by the school available to adult groups and, as their service develops, will rent from educational and commercial libraries.

There will also be a greater development in the organization of commercial film libraries. In addition to serving the schools, he remarked, they will be interested also in servicing extra-school and adult groups, organizing film societies for showings of specialized films, and exploiting the home market. Because of costs involved in operating a film library, it is likely that there will be commercial film libraries in only the larger cities, and that dealers in the smaller communities will serve as their booking agents.

Specialized distributors will be another source of films. In this class Mr. Larson named federal and state agencies; consular offices and tourist bureaus of other nations; special interest groups such as the National Tuberculosis Association, religious,

professional, labor, farm and youth groups; and business enterprises. Such organizations will organize their own regional libraries and, in many instances, will initiate the production of films which contribute to the achievement of their purposes. He expects big business to continue using films in merchandising, consumer education and public relations. There is a recent movement on the part of corporations to organize their own distributing organization in order to reach selected audiences and to control conditions under which films are used.

In summing up his remarks, Mr. Larson concluded that as this field develops, an increasing number of schools, colleges and public libraries will find it cheaper to buy prints of the more widely used films than to continue to rent them. The rate at which the film libraries will be organized depends upon the demand for films from school and adult groups.

**Who Will Pay for Them?**

This topic was handled also by Mr. Larson in the absence of Mr. John Guy Fowlkes, University of Wisconsin, to whom it had been assigned.

According to available evidence, schools between 1935 and 1940 purchased approximately 15,000 16mm sound projectors at an average annual expenditure of one million dollars, and spent less than one-half a million on films per year during the same period. These figures, Mr. Larson pointed out, would indicate that the annual budget for those five years was less than 5c per student, or about \$1.50 per teacher.

Some leaders in the field are suggesting a minimum of \$1 per student, or approximately \$30 per teacher per year. While this would be substantial progress, Mr. Larson expressed the doubt whether such a budget would support an adequate program of audio-visual aids, and gave some figures to substantiate his opinion. For instance, if we accept a minimum standard of one film per course per week, the number of projectors owned by schools must be increased to 200,000 and approximately 16,000 film subjects will be needed instead of the 1,000 subjects now suitable for instructional use, with a corresponding increase in prints. On the basis of a rough analysis of the cost of a well-rounded audio-visual program, he advised planning for an annual budget of approximately \$150 per elementary teacher, \$225 per secondary and over \$300 per college teacher.

However, it was his opinion that as

## West Indies (Caribbean Region I)

(Encyclopedia Britannica Films, 1841 Broadway, New York City) 11 minutes, 16mm. sound. Sale price \$50.00 less 10% discount. Apply to producer for rental sources. Discussion Guide available.

A filmic treatment of the West Indies that traces historical development and economic geography of the Islands.

Beginning with a map locating the West Indies in the tropical waters between North and South America, the film first locates and names each individual island and then indicates date of discovery, the period of Spanish conquest and practical annihilation, and assumption of control of Cuba, Puerto Rico, and Virgin Islands by the United States. The commentator states that the islands are prized because of their strategic position, and their natural wealth and beauty. Scenes show that the mountain ranges which run from east to west cause the rain to fall in such a way as to form dense tropical jungles. Following scenes show that the natives through industry and cooperation have transformed jungles into arable tracts where sugar cane, tropical fruits and vegetables, cacao trees, coffee, and tobacco are grown. In addition to large tracts considerable farming is done in small patches. These farmers carry their produce to nearby markets and exchange it for merchandise. Even though, as pointed out in the film, agriculture is the principal occupation, cattle raising is important and shots show great herds of cattle grazing.

Animated diagrams and actual photographs show the products that are exported and imported by the various islands. Among the chief exports are tobacco and sugar. Imports include manufactured and processed items such as farm equipment, automobiles, paper, chemicals, clothing, and prepared food stuffs.

The steps involved in raising and processing sugar show that hard labor is used to plant, cut and load the sugar cane. From there machinery is employed in transporting, crushing, refining and sacking.

The film closes with scenes which reveal that students are learning habits of health, handicrafts, and practical farming involving rather advanced scientific agriculture. Scenes of cities and central communities with their schools, stores and cafes evidence recent developments. The commentator concludes with the statement that such advances indicate that the West Indies will play a role in the modern world.

**Committee Appraisal:** The committee felt that the film was very good for presenting historical background of the Island, giving their exports and imports, the agricultural methods, con-

trasting hand labor with machine, and suggesting future importance. Skillful use of animation adds to the value. The usefulness of the film could have been improved through greater emphasis on human geography. Teachers of geography and social studies on the elementary and secondary levels will find this a valuable film.

## Baby Care—Feeding

(Educational Film Library Association, 45 Rockefeller Plaza, New York City, 20) 24 minutes, 16mm. sound. Sale price—\$65 less 10% educ. disc. Produced by Pennsylvania State College. Apply to distributor for rental sources. Discussion guide available.

Divided into two major sequences—correct feeding of the baby and baby's food—the film depicts the more accepted procedures at present in the science and art of infant feeding.

Introductory scenes show a mother gently awakening the baby for his feeding. She smiles and speaks softly in order to avoid frightening the baby as she gets him comfortable and ready for his bottle. She wears a clean wash dress and is following the time schedule and formula prescribed by the doctor. As she nestles the baby in her arms after having lifted him in the correct manner, she tests the heat of his formula and tips the bottle correctly to keep him from swallowing air. Air bubbles he may have swallowed are relieved by holding him upright against her shoulder while she gently pats his back. This procedure, known as bubbling, takes place half way through and at the end of his unhurried feeding.

The procedure to be followed in breast feeding is next shown and then again the mother and the bottle-fed infant are shown as the child is made ready for sleeping. It is recommended that the baby be put to sleep in differing positions in order to assure a well-shaped head. The window which was closed for the feeding is again opened.

The second half of the film is devoted to a step-by-step picture of the preparation of a day's supply of the infant's formula. The utensils needed for the procedure are shown and their care demonstrated. While the use of powdered milk, goat's milk, and cow's milk is treated briefly, the formula followed is based on the use of evaporated milk. Washing and sterilizing the equipment, precautions to be observed in caring for utensils are shown as the mother prepares the formula. The food is then bottled, cooled to room temperature, and stored in the refrigerator. The mother is also shown administering fish oil to the baby and likewise preparing sterile water for use in the baby's diet.

Flashbacks review important points in preparation of the food and feeding the baby as the commentator summarizes them.

**Committee Appraisal:** Useful in instructing mothers, Red Cross classes, practical nurses, social workers, junior and senior high school girls in the technique of feeding infants. Step-by-step presentation contributes to the unity and organization of the content. The home setting increases the interest of the lay person and the applicability of the film. Effective because of the clear photography, an excellently edited script, and a comprehensive scientific treatment that involves a minimum of technicalities. There was a difference of opinion among the nursing personnel on the evaluating committee concerning boiling rubber nipples for ten minutes and putting all the sterile drinking water in one bottle.

This monthly page of reviews is conducted for the benefit of educational film producers and users alike. The comments and criticisms of both are cordially invited.

Producers wishing to have new films reviewed on this page should write L. C. Larson, Indiana University, Bloomington, Indiana, giving details as to length, content, date on which the film was issued, basis of availability, prices, producer and distributor. They will be informed of the first open date when the Teacher Committee will review the films. The only cost to producers for the service is the cost of transporting the prints to and from Bloomington. *This Cost Must Be Borne By The Producers.*

## Fundamentals of Boxing

(Walter O. Gutlohn, Inc., 25 West Forty-Fifth Street, New York City 19) 10 minutes, 16mm. sound. Sale price \$21 less 10% educational discount. Produced by William Lewin. Apply to distributor for rental sources.

The film gives step by step the essential facts and skills that must be mastered if one wishes to become a successful boxer. It starts with the structure of the hand and how to make it into a fist—a fist that has power to deal an effective blow without injury to the boxer's hand. The relation of the fist to the forearm, the correct position of the arms, the feet—in brief of the whole body—for good boxing are then explained and demonstrated.

After these explanations of "on guard" positions and "stance," the picture demonstrates eight offensive blows—the jab, lead, hook, uppercut, swing, overhand blow, chop, and feint. During the demonstration, the commentator evaluates each of these in terms of the relative sizes of the two boxers, the ethics of the profession, and its value in the sport. This part of the film closes with three combinations of some of the above basic blows.

Next the foot work needed to maintain alert readiness is given. The main emphasis is on lower portions of the body during this demonstration. The advance, the retreat, and the side-step are covered. In like manner the basic defensive moves are demonstrated and discussed—again eight in number—the pickoff, cross block, safety block, cover-up, elbow and forearm block, slip of the head, the duck, and the weave.

The last part of the lesson deals with clinches. It is pointed out that there are several, but only three are given and illustrated—to keep the opponent off balance, encircle the body and raise the arms, and the elbow lock.

The picture closes with a boxing match between two lads about ten or twelve years of age. During the match the commentator states that after all the basic facts are learned, each individual boxer develops his own characteristic way of boxing—a way that for him provides effective protection and the best chance to get in telling blows against his opponent. He says only practice—constant practice—gives a boxer confidence in his own skill and the quick judgment that will make him a winner in this sport.

**Committee Appraisal:** The film is well organized—starting with the formation of a fist and logically working up to the more complex phases of boxing. The silent titles add strength to this organization. Some of the more difficult parts are repeated in slow motion. Quality of photograph and sound are excellent. Highly recommended for use in physical fitness programs on elementary, high school, and adult levels.

## Dehydration

(Motion Picture Service, United States Department of Agriculture, Washington, D. C.) 17 minutes, 16mm. sound. Apply to producer for terms governing purchase and for list of rental services.

Shows and explains how scientific research, under the stimulation of pressing war needs, has made remarkable advances in processes by which the water content of many foods are removed to save weight, space, containers, and transportation. Some products are also compressed after dehydration to obtain further savings.

Pointing out that the principles of dehydration have been practiced for a long time, by the Hopi Indians, for example, the picture shows many interior scenes of modern plants preparing, dehydrating, and packing vegetables, milk, meat, eggs, and juices by various methods.

How research laboratories have contributed to the improvement of these processes is also shown. As the camera shows various laboratory tests, the narrator explains: "In the laboratories were discovered the ways to perfect these featherweight foods without destroying important food elements: temperature control, synchronization of mechanical handling and chemical reaction, the elimination of bacteria development. With the war, science redoubled its efforts, finding ways to better preserve precious vitamins and nutritional values."

The picture stresses the importance of dehydrated food

Reg. U.S. Pat. Off.

# STEREO-SILVER SCREENS

## For *THREE-Dimensional* Projected Pictures

Where it is desirable to illustrate the natural perspective of objects as they appear to normal vision—as in the teaching of astronomy, geometry and celestial navigation—THREE-Dimensional projected pictures offer unmatched advantages. They show spacial relationships of objects as no other method can.

Because their illusion of depth depends on polarization of light, (which separates the picture images for the right and left eye) THREE-Dimensional pictures require a special screen that does not depolarize the light while reflecting it.

Collaborating closely with the foremost manufacturers of Three-Dimensional projection equipment and slides —(including The Polaroid Corporation, Society for Visual Education, Inc. and the Three-Dimension Company)—Da-Lite Screen Company has pioneered in developing suitable screens for THREE-Dimensional projection..

The Da-Lite *STEREO-SILVER* Screen has a specially processed surface designed to reflect without depolarizing, provides good illumination, yet is adaptable to various mountings to meet all installation needs. TRIPOD mounts, WALL and CEILING models, as well as FRAME-TYPE mounts, can be obtained.

Ask your *Visual Education Dealer* for details or write us.

Dallas 1, Tex. 1700 Patterson Ave.

for shipment overseas to our soldiers in battle. A jeep is shown transporting to an infantry company enough dehydrated food in a small package to equal five truckloads of fresh food. Other enlightening comparisons are made between the bulk and weight of fresh products and the dehydrated ones.

Concluding commentary explains that nearly all of the wartime production of dehydrated food is being used either by the Armed Forces or commercially, but points to future possibilities for other consumers.

**Committee Appraisal:** An interesting film to show the step-by-step process of dehydration. The inclusion of the historical background adds perspective and the suggestions for further development and use of dehydration present a challenge for the future. Should be useful and interesting to classes in home economics, social science, and vocational agriculture.

**Fundo in Chile**

(Coordinator of Inter-American Affairs, 444 Madison Avenue, New York City) 22 minutes, 16mm. sound. Produced by Julien Bryan. Apply at distributor for a list of depositories and terms governing purchase.

Four great oxen drawing a towering load of hay on the fundo of Don Francisco open the picture of the contrast in handling large landed estates in central Chile. An old serving woman says a prayer at the altar for the dead master; shortly afterward the lawyer reads the will which divides the fundo. The ancestral home Santa Rosa, with its cattle and pastures and 400 acres of wheatland and chapel is willed to the younger son, Juan. There life moves on as it has in the past—women pump water from the irrigation ditch for gardening, food is prepared in the kitchen of the rambling old house, the farm chores are done by the hand labor of men—while Don Juan, living in Santiago, leads a gay social life.

The larger, more remote estate, San Miguel, is willed to Don Roberto, who has received training in agriculture at Ames, Iowa. The film shows Roberto talking over his plans for improvements on his 15,000 acres with his foreman, his architect, and other supervisory assistants. Within a few months he sees his crop of wheat doubled by the use of tractors, threshing machine, and an improved system of irrigation. He introduces on San Miguel a new crop, hemp, and a plant to process its fibers. For his fine herd of cattle cared for and improved by trained veterinarians he maintains individual production charts. In connection with this herd he establishes a large sanitary powdered milk factory.

Out in the fields the workers are shown eating a hot meal that had been prepared in Roberto's kitchen and taken to them. The mud huts of the workers are seen replaced by model new houses with garden plots for the workers' families. A school, well attended, is pictured as one of Roberto's contributions to the welfare of his people. Here he sees that the children have free lunches. A nursery with a trained nurse and the services of a doctor is established for the younger children. Like the ancestral fundo Roberto's estate has a chapel and the girls of his estate are shown at one of their first communion services.

The film in conclusion depicts Juan, the absentee landlord, visiting Roberto at San Miguel after a lapse of several years. He is impressed as he admires the improved irrigation and the prize bulls imported to build finer herds of cattle. Juan recognizes the contrast between the old and the new agriculture. One loses sight of Juan as Roberto leads him farther into the fields of the modernized San Miguel.

**Committee Appraisal:** This contrast of methods of handling large estates in Chile may well serve as the basis for a provocative discussion on the differences between farming in North America and South America and on the possibility of some of the South American nations changing from their present patterns of farming to those followed in the United States. In this film Julien Bryan has capitalized most effectively the potentialities of the medium in a realistic and representative portrayal of the life, habits, and customs of the agrarian population of Chile. Recommended for use both by adult and student groups discussing socio-economic phases of South American life.

**No Story Was Ever Told, Until . . .**

(Concluded from page 290)

passive participation in viewing a film, the pupil will seek and see information or activity in the film. This will answer his questions, raise points for discussion, direct his laboratory or project activity, or serve as a review for the examination.

The classroom film of the future will most likely not be over seven to twelve minutes in length. It will be used daily or at the introduction of a unit lesson. The film will replace the present day verbal or written "overview." Supplementary stills, slides, and wall charts will be desirable materials for minutiae.

Textbook writing, editing, publishing, and marketing is a stable sector of our business enterprises. It does not rival, but complements the production of novels and literary publications. Similarly, the production, marketing, and distribution of education films holds promise of developing into a complementary partner of Hollywood. The production end alone opens careers in planning, engineering, research, script writing, and execution, or "shooting the scene." Animated pictures, extension into color printing, polarization for depth, and use of the stereoscope, all offer auxiliary services to the parent field.

Every branch of the armed services is using films to streamline its educational program and compress the educative process. The post war educational program will demand similar impetus. Opportunity is knocking for someone, millions in reality, to open the door to a new storehouse for mankind.

**School-Made Motion Pictures**

(Concluded from page 306)

witness the red in the red winged blackbird, in the flicker, the touch of red in other birds as well as in flowers.

When you buy your roll of film be sure to specify whether it's regular you want, or type A. The regular Kodachrome is used only for outdoor photography, with the sun as your chief source of light. If you must finish that roll of outdoor film indoors, use blue photoflood lamps to illuminate your scenes. This does not alter the emulsion speed of your film. However, if you use the white photofloods be sure to slip on the blue filter over your lens to simulate daylight. This drastically cuts down the emulsion speed and requires more lamps to compensate for the absorption of some of the light by the blue filter.

From my own experience I prefer to use Kodachrome, type A. Using it indoors, without any filter, it gives excellent results with regular Photoflood lights. Indoors its emulsion speed is one and a half times as fast as the regular Kodachrome. When continuing filming outdoors, all that is necessary is the addition of the salmon colored filter for daylight, since type A is extremely sensitive to blue light. With the filter for outdoor use, the emulsion speed becomes like that of the regular type. The one important rule to remember is never to combine daylight with tungsten—you'll be sorry, if you do.

**Threefold  
EDUCATIONAL SERVICE**

offered by  
**ENCYCLOPAEDIA  
BRITANNICA FILMS**

**Authenticity of Subject Matter Assured**

Because the authenticity of all material presented is safeguarded by the collaboration of outstanding authorities and subject-matter specialists, Encyclopaedia Britannica Films offer educators the most authentic classroom film library ever produced to meet the demands of the school curriculum.

**Correct Film Selection Assured**

To help you properly select Encyclopaedia Britannica Films for your school system, we prepare, without obligation, an Integration Study after duly analyzing your school syllabi or courses of instruction. With this individualized Integration Study before you, you can systematically build an Encyclopaedia Britannica Film Library to fit your courses of instruction.

**Proper Film Utilization Assured**

When Encyclopaedia Britannica Films are introduced into your school system, our Film Utilization Service at once plays an important role. Highly trained teachers, selected for their comprehension of modern instructional problems, explain the techniques of using Encyclopaedia Britannica Films as an instrument for dynamic classroom instruction.

## Victor Observes "Coming of Age" of 16mm Industry

**T**RIBUTE to the inventive genius and vision of Alexander F. Victor and his associates in the Victor Animatograph Co. was paid by leaders in the non-theatrical motion picture industry, government officials and local business men at a dinner in Davenport, Iowa, Saturday evening, August 12, held to commemorate the twenty-first anniversary of the invention by Mr. Victor of the 16mm camera and projector.

Mr. Victor's invention has made it possible for the first time in the history of the world to develop a means of communication through which it is possible to define for the world those terms which made democracy work. Dr. V. Clyde Arnsperger, New York, vice president of Encyclopedia Britannica Films, Inc., asserted in a talk dealing with the educational aspects of the 16mm films.

C. R. Reagan, Washington, D. C., director, non-theatrical division, bureau of motion pictures, Office of War Information, declared that we did not realize until

almost too late the possibilities of mass information about democracy. "Then along came Victor and other pioneers and gave us a legitimate tool which we could use to educate the masses," he said. "We had mass production, and he gave us the means of providing mass education." He asserted that the 16mm camera and projector is not only an excellent medium for use in winning the war, but that it will help us win the peace as well. "Since we can't all travel around the world and learn to understand each other we have got to bring the world to all of us . . . We can do it through the 16mm film better than any other way."

The part played by the invention of the president of the Victor Animatograph Co. in industry, in business and international affairs was also dwelt upon by various speakers during the program that followed the dinner. They told what the invention has meant as a powerful instrument in training our men in the armed forces for their job of destruction, and pointed out how it will be called upon equally to retain them after the war in peaceful arts. They explained the function of the 16mm camera to make us better acquainted with our neighbors

(From left to right) Samuel G. Rose, executive vice president, A. F. Victor president, and Ernest G. Schroeder, general sales manager of Victor Animatograph Corporation at ceremonies marking the twenty-first Birthday of the 16mm industry, compare modern Victor sound motion picture equipment with the first 16mm camera and projector ever produced. Mr. Rose and Mr. Victor have been associated for 33 years—the oldest executive in point of service, in the non-theatrical motion picture industry. They announced the first 16mm equipment on August 12, 1923.

in far off lands, and to give them a better understanding of us.

How the 16mm camera is helping to raise standards of living and improve the general health and morale of South America, as well as other continents, was discussed by Robert C. Maroney, New York, director of motion picture distribution for the coordinator of Inter-American affairs.

How a local industry has used the Victor product to good advantage was recited by James D. Shelvin, director of the department of industrial relations and Personnel, of Deere & Co., Moline, who declared that the application of the 16mm camera to industry has been a boom.

In responding to the various expressions of esteem and good will Mr. Victor spoke briefly and informally of his original ideas regarding the development of the smaller sized film of non-inflammable material, and of the opposition to it that was finally overcome. He was introduced by Sam G. Rose, executive vice president of the company, and associated with Mr. Victor for the last 33 years. He read a list of names of persons from whom congratulatory wires were received from various parts of the country.

Others who spoke included Mayor Arthur R. Kropach, William Redpath, Toronto, Can., of General Films, Ltd., and Otto Coelhn of Business Screen, Chicago. Lee J. Dougherty, vice president of the Occidental Life Insurance Co., acted as toastmaster.

### The Challenge of Television

(Concluded from page 285)

The inspirational value of seeing historical events as they occur should be exploited. Students can have a feeling of participating in these events by seeing them as they take place. This should be particularly stimulating to young and eager minds. Ultimately, some system will be found for relaying programs across the oceans, and it would be interesting to have a group of pupils in England interchange ideas and experiences with a similar group of American children, face to face, through the magic agency of video screens.

If future wars are to be avoided, an unceasing crusade must be maintained by men of good will everywhere to overcome causes of international friction. Television will offer undreamed of possibilities for good or evil. It must be harnessed to the cause of better understanding between neighbors. It is the highest culmination yet achieved by Man in his struggle to perfect the art of communication. We today have a fearful but inspiring obligation to future generations to make sure that this powerful new force of television is from the outset irrevocably dedicated to the greatest good and dignity of Mankind.

## TRIPLE-PURPOSE FILM-SLIDE PROJECTOR

**GoldE**

**MOTOR DRIVEN  
FORCED AIR-COOLED**

**NO REWINDING  
NECESSARY**

**FINEST LENS  
OF ITS TYPE**

**3-WAY USE**

- 2 x 2 Paper or Glass Slides
- Single Frame Slidefilm
- Double Frame Slidefilm

**Instantly Set up**

**Corrected Lens—Can Be Cleaned Easily**

**Film Loops Naturally ... Will Not Scratch**

**Conveniently Portable —Yet Very Stable**

It's easier, more economical to use this versatile 3-in-1 projector. Gives more illumination per watt—assures perfect clarity of image. Can be changed from film to slide showing—in a jiffy! Modern design. Has Manumatic slide carrier—Kwik-Lok spiral focusing—smooth tilting—fingertip control—accurately centered optical system. 300 watt lamp capacity. Complete with custom-built carrying case.

# AIR-FLO STEREOPTON

**GoldE**

**FOR LONGER DISTANCES**

**FOR COOLER OPERATION**

**LAMP CAPACITY UP TO 1000 WATTS**

- Forced-Air Cooled**
- Adjustable Bellows**
- Built-in Tilting Device**
- All-Steel-Welded Construction**

Another GoldE advancement in stereopticon design! This modern, trouble-free Stereopton withstands constant operation—heat absorption filter gives slides added protection from heat damage. Precision optical system uses the finest ground and polished lens. (Choice of 3, from wide range). Shows standard 3 1/4" x 4" slides. Compact—conveniently portable.

Above Items Now Available on MRO Ratings to: Educational Institutions—Army and Navy—Maritime Bases—War Industries—Government Agencies—Medical Professions, etc.

Pied Piper of Hamelin	2 r	Othello	3 r
Robinson Crusoe	3 r	Rip Van Winkle	3 r
Rumpelstiltskin	3 r	Silas Marner	3 r
Story of Santa Claus	1 r	Stratford-On-Avon	1 r
The Wee Scotch Piper	1 r	Uncle Tom's Cabin	3 r
William Tell	1 r		

As our library is for teaching purposes only, **all films are 16mm. silent.**

Most of the 3 reel subjects are condensed from longer features with essential content retained. Can be shown in ordinary classroom period. This has met with great approval by literature teachers.

**Two Reasons Why Schools Like to Book Films from Our Library:**

1. Our films always ARRIVE AHEAD OF TIME.
2. We have many prints of each subject so it usually is not necessary to give a second choice of either dates or titles.

**New York State Film Distribution Plan**

Schools and educational institutions within New York State and visual education instructors will be interested in a new plan of distributing free 16mm. sound motion pictures, which is being inaugurated October 1st and which has been developed by the Film Division of the New York State War Council. The purpose of the plan is to make more readily available to the residents of New York State a library of 16mm. films dealing with the peoples of the United Nations and of our allies, and the contribution being made by each toward the vanquishing of our enemies.

According to the plan, eleven strategically located film distributors, including the Film Division of the State War Council, will contribute their services and their established distribution facilities toward a more effective use of these films. Each distributor has been assigned specific counties. Operation of the plan and coordination of the activities of the distributors is taking place under the direction of Edward J. Mallin, Administrator of the Film Division of the State War Council. The eleven distributors are: Film Division, State War Council, Albany; New York University Film Library, New York City; New Paltz Film Center, New Paltz; Adirondack Film Library, State Teachers College, Plattsburgh; Off-Campus Teaching, Potsdam State Teachers College, Potsdam; Utica Film Exchange, Utica; Oneonta Film Exchange, Oneonta State Teachers College, Oneonta; Educational Film Library, Syracuse University, Syracuse; Educational Film Service, University of Rochester, Rochester; Pan-American Council of Buffalo and Western New York, International Institute, Buffalo; Cooperative Film Library, State Teachers College, Fredonia.

A very interesting although not entirely new feature of the plan is that two and three subjects are mounted on one reel to make up single programs varying in length from 30 to 45 minutes running time. In this way related subjects are combined on a topical basis for the purpose of discussion or for classroom and lecture presentation. An initial group of 17 identical programs has been made up for each distributor. Additional programs will be added as they become available. Descriptions of the films as well as the films themselves may be secured by writing to the distributors named above.

The plan could not have been put into effect without the valuable contributions of outstanding film subjects made by the Office of Coordinator of Inter-American Affairs, Office of War Information, and the United States Information Office, represented respectively by R. C. Maroney, C. R. Reagan and John J. Jenkins. Approval was given to the plan by Assembly Speaker Oswald D. Heck, State War Plans Coordinator, and Harold H. Schaff, Executive Secretary of the State War Council.

Another feature of the plan is that each distributor

# Notes

is privileged to draw films from the War Film Library of the New York State War Council Film Division. The Film Division library distributes more than 300 subjects of the informational, documentary and instructional types, to all responsible organizations and residents of the State. Free descriptive catalogues may be secured by writing to the Film Division, New York State War Council, 353 Broadway, Albany 7, New York. Any borrower desiring only single subjects from among those included in the combined programs may secure them by addressing requests to the Film Division.

## Iowa-Nebraska Institute on Audio-Visual Aids, October 12-14

A three-day institute of Audio-Visual Aids to Teaching will be held October 12-14 at The University of Omaha, Omaha, Nebraska. Experienced and well-qualified speakers have been secured for the program, which will offer also practical demonstrations of visual teaching methods. Dr. Walter Wittich, Lecturer in Audio-Visual Education at the University of Wisconsin for the past two years, and Director of Curriculum and Visual Aids in the city schools of Madison, Wisconsin, will conduct all classroom demonstration work on October 13 and 14, using classes of elementary, high school and college students.

A special program has been arranged for school board members and administrators all day Thursday, October 12. A representative of the Union Pacific will trace the use of both silent and sound film in private business; Dr. Floyd Brooker, Director of Visual Aids for War Training, in the U. S. Office of Education, will show the national and world use of film in the war-industry training program; and Lt. James Brown, Officer in Charge of Training Aids at Great Lakes Naval School and in the entire 9th Naval District, who was director of Audio-Visual Education for the State of Virginia before going into the Navy, will tell of experiences with audio-visual aids in military training programs. Bruce Findlay, Director of Audio-Visual Aids in the Los Angeles Public Schools, will tie all the previous discussions together into a talk on the development of these aids in the educational field, and show how to set up, budget, and operate such a department.

At the following evening session, Mr. Dean Douglass, for many years a school administrator and now regional manager of the educational department of RCA, will lead a discussion on "Radio in Education"—present trends, the F. M. educational networks, operation of present city and state systems.

On Friday evening following dinner, a panel on "Educational Implications of Sponsored and Quasi-Educational Film Development (advertising film, OWI, CIAA and other propaganda material) will be held. The arguments will be led by Dr. V. C. Arnsperger, Lecturer on Visual Aids at Columbia University

and representatives of the OWI, CIAA, an advertising group, and the Canadian Film Board.

The entire staffs of Iowa and Nebraska colleges, elementary and secondary schools, county superintendents, religious-education and industrial-training groups are urged to attend the conference. A wide variety of all types of audio-visual equipment will be on exhibit.

**OWI 16mm Film Advisory Committee Confers**

Mr. C. R. Reagan, Head of the Non-Theatrical Division, OWI Bureau of Motion Pictures, called a meeting of the National 16mm. Motion Picture Advisory and Policy Committee in Chicago on August 15. The organizations which were represented were the Educational Film Library Association, Department of Visual Instruction of the N. E. A., Allied Non-Theatrical Film Association, National University Extension Association, National War Committee for Visual Education Industry, Visual Equipment Manufacturers Association and the National Association of Visual Education Dealers. Representatives of the Audio-Visual Aids Committee of the American Library Association, were unable to attend.

It was too soon to have a complete record of showings of Fifth War Loan films, as only twenty-three states had so far reported. Their accomplishments, however, indicated that 16mm motion pictures had done a job far beyond expectations—26,269 showings to a total attendance of 9,290,902. All previous records in using 16mm films to sell war bonds are expected to be broken in the Sixth War Loan Campaign which gets under way in November under the leadership of Merriman Holtz, appointed by Ted Gamble, Director of War Finance Division, to head the National 16mm. War Loan Committee. Mr. Holtz was present at the meeting and outlined some of the plans under consideration for the drive.

Such effective and nationwide use was made of 16mm. projectors and war films to sell war bonds in

the Fifth War Loan Campaign, Mr. Reagan reported, that all government agencies are now eager to give film footage to the Treasury Department for the Sixth War Loan Drive.

As evidence of further cooperation from government agencies, he announced that the War Department will furnish prints of their incentive films for OWI 16mm. distribution after war plants are covered. Members of the Advisory Committee questioned the desirability of continuing distribution of sponsored films by the OWI.

Another interesting development reported upon is the formation of an inter-government committee by five federal agencies distributing 16mm. films to the civilian home front—the U. S. Department of Agriculture, U. S. Public Health Service, Office of Inter-American Affairs, U. S. Bureau of Mines, and Office of War Information. This committee meets monthly in Washington to develop closer cooperation and standardization of procedures.

The following resolutions were passed:

I. The National OWI 16mm. Advisory Committee, conscious of the extraordinary performance of 16mm. film distributors in the Fifth War Loan Drive, wishes to acknowledge the opportunity afforded by the War Finance Committee of the United States Treasury and the OWI's Bureau of Motion Pictures for the 16mm. industries to participate directly in a national campaign by putting at the disposal of our government for the first time the resources of the 16mm. medium. Recognizing that our resources have only begun to be employed fully, we pledge ourselves to a far greater effort in the Sixth War Loan Campaign, November 11 to December 7.

II. The National OWI 16mm. Advisory Committee commends the recently organized Inter-government 16mm. Film Committee, comprising representatives of government agencies distributing films to the public, for their efforts toward a more effective coordination of the 16mm. production and distribution activities of federal agencies.

**NAVED'S Conference on the Dealer's Role in Postwar Developments in Visual Education**

One hundred and fifty-six people attended the final session of Naved's post-war conference, in Chicago, which was the Annual Banquet, on the evening of August 14, and heard representatives from industry, government, Hollywood, and education predict the probable trends in the future production of visual materials. Mr. Harlan Hobbs, Film Officer of the Owens-Illinois Glass Company, Mr. Roger Albright of the Hays organization, Mr. Floyd Brooker of the United States Office of Education, and Dr. V. C. Arnspiger, Vice-President of Encyclopaedia Britannica Films, Inc., were the respective speakers from each of these fields.

The new officers of the Association elected at the meeting are President, Richard F. O'Neil of Boston, Massachusetts; First Vice-President, Merriman Holtz, Portland, Oregon; Second Vice-President, D. T. Davis, Lexington, Kentucky; Secretary-Treasurer, Bernard A. Cousino, Toledo, Ohio. The Association adopted a new code of business ethics and a new constitution providing for its administration by regional chairmen in seven zones. These regional chairmen are, Art Hebert, Hartford, Connecticut; Tom Brandon, New York City; Jasper Ewing, Baton Rouge, Louisiana; Earl Carpenter, Cleveland, Ohio; Frank Bangs, Wichita, Kansas; A. J. McClelland, Vincennes, Indiana; James A. Wallace, Oakland, California; Members at Large, Wells Alexander, Atlanta, Georgia; J. E. Foss, Pittsburgh, Pennsylvania; Hazel Calhoun, Atlanta, Georgia.

The high spot of the conference was the special citation awarded to the Association by the Secretary of the Treasury, personally presented by Theodore Gamble, the National Director of the War Finance Division of the Treasury. Mr. Gamble, who flew to Chicago to present this unexpected award, also announced the names of the distributors who won the Association's competition for the best program for the use of films in the Fifth War Loan Drive. Mr. Gamble indicated that the special award committee was unable to select between two first prizes, and therefore awarded the trophy to both associations, the D. T. Davis Company of Lexington, Kentucky and to H. U. M. Huggins, Los Angeles, California. He also awarded honorable mention to ten other firms.

The Association passed resolutions regarding various aspects of the dealer's postwar program contained in a special handbook prepared for the conference by Donald Bean, Naved's Educational Consultant. Copies of the handbook were distributed at the meeting.

### Business Films Library Established

A Visual Aids Division has been formed at the Evening Session of the City College School of Business and Civic Administration to make available a "unique" library of business films to students, educational institutions, business firms and other organizations. It will be used to acquaint commercial and industrial personnel veterans, and other groups with the newest techniques of salesmanship, marketing, retailing, business management and other operations. Films will be prepared by the School of Business on numerous phases of business and will also be gathered from business firms and other agencies.

The Visual Aids Division will maintain the films and develop specialized techniques for their proper use in the training of men and women. Dr. Robert A. Love, director of the session, announced. Any group wishing to use films will be entitled to do so upon payment of a small rental fee to cover the expenses of the Library. At present the Division will service the metropolitan New York area, but it is planned to eventually extend the service to a nation-wide coverage.

Two films are now in preparation by the Evening Session. A retailing picture will illustrate the flow of merchandise from receipt to individual sale, and will stress organization, display and sales technique. Another film will be made in large wholesale establishments and will picture the entire marketing process from arrival of fruits, vegetables and other commodities on ships and trains, to their eventual sale to retail establishments. Kodachrome color films will be used on all projects undertaken by the school.

### Texas Visual Education Forum

A successful Visual Education Forum was held August 21 and 22 at the University of Texas, Austin, sponsored by the School of Education, Division of Extension, and Zone IX of the Department of Visual Instruction.

"Administration of Visual Programs" was the theme of the addresses at the first session Monday morning. Alfred L. Hall-Quest, Professor of Education at New York University, stressed the desirability of "Planning for the Use of Visual Aids in Schools from the Point of View of Buildings and Equipment." Audio-Visual plans of the State Department of Education were summarized by John W. Gunstream, Director, Radio and Visual Education. D. W. McCavick, Director, Visual Instruction Bureau, University of Texas, told how such Bureaus can stimulate the use of visual aids in public schools. "The Services of a Regional Film Library" were explained by G. C. Morlan, Abilene Christian College. Miss Emma Gutzeit, Director, Radio and Visual Education, San Antonio Schools, concluded the session with a description of the functions of a director of visual education in a city school system.

Monday afternoon was devoted to panel discussions relating visual aids to the secondary, primary and elementary curriculum, and a demonstration of visual teaching by Mrs. Mary E. Windle, Consultant, Encyclopaedia Britannica Films. "The Contribution of Vis-

## "MADE-TO-ORDER" PICTURES -- That Really Tell YOUR Story

Do you have a sales message to punch across . . . a progress story to relate . . . or perhaps are looking for a *simplified* method of teaching your personnel to do a better job? Well—we are specialists in the making of special films that tell a retentive story, easily and quickly.

Our large fully equipped sound studio in New York is available—or where it is more advisable, capable crews and adequate equipment are placed at your disposal. Talent too, if desired. If you're interested, write for full particulars today . . . our experienced staff offers time-proved advice, with no obligation on your part.

*Be Sure—Ask for the Best*

## FILMCRAFT PRODUCTIONS

Division of: **SOUNDIES DISTRIBUTING CORP. OF AMERICA, INC.**

**2828 Decatur Ave., Bronx, N. Y.—Fordham 7-9300**

ual Aids to Inter-Group Understandings," was the topic of the evening's speeches, with Inter-American relations specifically treated, by J. H. Aydelotte, Sam Houston State Teachers College; Thomas L. Sutherland, Local Coordinator of Inter-American Affairs, Austin; Ralph B. Long, and Jesse J. Villarreal, both of the University of Texas.

The second day's program opened with a panel on "Courses of Instruction in Visual Education," under the chairmanship of M. L. Goetting, Baylor University. The last session, Tuesday afternoon, was concerned with "Visual Aids in the Post-War Period." C. R. Crakes, Educational Consultant for DeVry Corporation, made some predictions as to their future possibilities, and Mr. Hall-Quest offered some suggestions on "Planning from the Point of View of the School Administrator." Plans for the use of visual aids in the field of Physical and Health Education were presented by David K. Brace, University of Texas. The commercial interests' plans were set forth by George H. Mitchell of Visual Education, Inc.

The two-day meeting closed with a summary and evaluation of the Forum by T. H. Shelby, Dean of the Division of Extension, University of Texas.

### Film Program Planned by Church of England

The Church of England, at the instance of the Archbishop of Canterbury, Dr. William Temple, has set up a Film Commission to undertake an ambitious motion picture program embracing not only research, but the production and distribution of films. The Commission

proposes to make intensive inquiry into: (1) The production and use of religious films generally; (2) The use of documentary and other secular film in religious programs; (3) The filmstrip and film slide. An information bureau, a booking agency, and a viewing panel have already been established. A film library is also planned. The information bureau will give advice on the choice and care of equipment, issue classified lists of selected religious and secular films, advise the clergy, teachers and others in the use of films, maintain contacts with the motion picture industry and the press, and in general undertake public relation. The booking agency will arrange for the hire of suitable films from all sources. The viewing panel will approve films selected to form the Church of England film library.

It has been proposed that distribution of the films be arranged through the Society for Promoting Christian Knowledge. The Commission's plan has aroused much interest in non-theatrical circles, wherein considerable activity is afoot and dramatic results have been achieved in the utilization of the motion picture in various propaganda forms.

### Navy Incentive Films

Four motion picture shorts, produced by the Industrial Incentive Division, U. S. Navy, are now available for showings to war plants. They are *Behind Nazi Guns*, the inside story of Germany's industrial war power today; *The Battle Against Shop*, showing why the men at the front need production backing; *Your Ship in Action*, the saga of a fighting ship; and *For Distinguished Service*, a film on petroleum.

# Current Film News

■ **CASTLE FILMS, INC.**, 30 Rockefeller Plaza, New York, provide another authentic, filmed-under-fire reel on World War II with their film record of:

**Invasion of Fortress Europe**—showing D-day exactly as it happened. Pictured are the thrilling air bombardment, paratroops, glider forces, enormous armada, shattering naval barrage, and dauntless men storming shell-swept beaches.

**Rome Falls to Allies**—on the same reel—reproduces the historic entry of American troops into Rome, first Axis capital to fall, and the out-pouring of liberated Romans into Vatican City to be led in thanksgiving by the Pope.

■ **WALTER O. GUTLOHN, INC.**, 25 West 45th St., New York, announce the release of a new series of six instructional films on cartooning, based on the visual method originated by Gene Byrnes, creator of the comic strip "Regular Fellers." Fred Cooper, former art editor of *Life* demonstrates:

**How to Draw Cartoons** (Match Stick Cartooning)—*Figures* (2 reels); *Heads and Expressions* (2 reels); *Animals* (2 reels); *Action* (1 reel); *Hands, Feet, Clothing and Drapes* (2 reels); *Composition and Story* (1 reel). Available in 16mm sound and silent film, and in filmstrips, this series should provide valuable material for basic art training.

Another September Gutlohn release is the inspiring feature, entitled:

**Our Blessed Lady**—6 reels—which traces the history of the Cathedral of Notre Dame and relates the events that

have taken place about the famous structure in the six centuries of its existence. Presented also are the jewels and relics of the Cathedral including a portion of the true Crown of Thorns encased in a circular monstrance of pure gold. The commentary is by Father Robert W. Gardner of the Catholic Foreign Missions Society. The musical score is played by Marcel Dupuy on the grand organ of Notre Dame Cathedral.

Gutlohn has opened an additional branch office at 302½ South Harwood Street, Dallas 1, Texas, to serve the Southwest areas. The development of

this organization into one of the largest distributing firms in the field is reflected in the expansion measures taken recently, which include branches in Chicago, Illinois and Oakland, California.

■ **BRITISH INFORMATION SERVICES**, 30 Rockefeller Plaza, New York, offer many new releases on a sale or service charge basis, including:

**Liberation of Rome**—record of the Italian Campaign and the difficulties encountered before Cassino fell.

**Cherbourg**—showing combined British and American action in Normandy subsequent to D-Day; liberation by American forces.

**In the Drink**—describes the use made of emergency equipment packed in collapsible dinghies carried by all British bombers when bomber hits the sea.

**A Start in Life**—what is being done in Britain to ensure proper child care.

**Lessons from the Air**—presents the planning and execution of educational programs which are radioed to schools all over Britain.

**Crofters**—life of small farmers who raise sheep and cattle in the Scottish Highlands.

**The New Crop**—reforestation work being done in Britain.

**New Zealand**—agricultural and industrial life, with a description of the country's people—the Maoris and Whites.

**Partners in Production**—(available only on loan)—an authentic picture of Labor and Management in collaboration in Britain.

**Tyneside Story** (15 min.)—what was done at a shipyard to ensure the availability of personnel.

□ **PICTORIAL FILMS, INC.**, R. K. O. Building, New York, released this month two additional films in the RKO series, *This Is America*, namely:

**Broadway Dim-Out**—presenting scenes from the Nation's Main Street in wartime; famous night clubs, glimpses of New York hit shows, and some of the people who make Broadway what it is.

**Arctic Passage**—a saga of the great Northwest and the men who defied Nature to construct the Alcan Highway through the virgin forests of Canada and Alaska.

■ **SARRA, INC.**, 16 East Ontario St., Chicago, in cooperation with National Safety Council, has produced the following industrial safety motion picture to meet industry's demand for a safety instruction course on a vital subject, for war plants and training schools:

**For Safety's Sake**—2 reels, 16mm and 35mm sound. The film covers, in dramatic action, all phases of safe operation of portable hand tools such as saws, grinders, drills, etc. It is designed to hold employee interest from first to last.

■ **BELL & HOWELL CO.**, 1801 Larchmont Ave., Chicago, have acquired the entire library of educational and travel films produced and long distributed by Burton Holmes Films, Inc. The original negatives, many of them photographed personally by Mr. Holmes on his world travels and explorations, have been put into the custody of the new distributor. Sale and rental prices remain unchanged.

Other educational short subjects in 16mm sound recently acquired by Bell & Howell are:

**Roar Navy Roar**—2 reels—a story of the American Navy from the days of

the wooden frigates to the super-dreadnoughts of today; how the Navy has kept our flag flying on the Seven Seas.

**Home Vegetable Garden**—2 reels—a sequel to "Garden for Victory." James H. Burdette, head of the National Garden Bureau, gives detailed information on victory gardening, with special advice to late season gardening.

■ **OFFICE OF WAR INFORMATION**, Bureau of Motion Pictures, Washington, D. C., is distributing to OWI depositories:

**Target—Berlin**—17 minutes—the story of the first Canadian-built Lancaster Bomber. Produced by the National Film Board of Canada, the film documents a tremendous production job that made a tremendous fighting job. When the completed Lancaster is rolled out into the dawn at Victory Aircraft, throngs of the men and women who built the plane gather to see the take-off, each one knowing that a part of himself is heading for Britain and for battle over Europe.

**The Memphis Belle**—41 min.—a color film produced by the Army Air Forces under the direction of Lieut. Colonel Wyler. It brings home the full

impact of usual events in our young fliers' lives when it follows the Eighth Air Force's daylight bombing raid on Wilhelmshaven from beginning to end.

**These Are the Men**—11 min.—Nazi leaders shown debasing and poisoning the minds of the youth of Germany. Made available through the British Information Services.

**Corsica**—10 min.—portrays Allies landing in Corsica and coming to the aid of the islanders. The historical significance of the leading cities is outlined, and a glimpse given of the customs of the native people. Made available through the French Press and Information Service.

**Behind the Winning Punch**—18 min.—stressing the urgent need for steel and scrap. Supplied through the courtesy of the War Production Board.

■ **OFFICIAL FILMS**, 625 Madison Ave., New York, present an entertaining and instructive Sportbeam with the August release of:

**Bows and Arrows**—an adventure in archery, filmed against the scenic background of Pinehurst, N. C. Experts demonstrate correct technique, and give regular instruction on the target range, covering grip, stance, etc. Stunt shooting and archery games complete the reel.

■ **Y.M.C.A. MOTION PICTURE BUREAU**, 347 Madison Ave., New York, reports the following additions to its film library:

**Lifeline of a Nation**—2 reels, color—depicting the important part played by railroads in carrying men, machines and ammunitions of war.

**Freedom Rides on Rubber**—2½ reels—a complete picture of the history, development and final achievement of making synthetic rubber, including Edison's many experiments.

**Passport to Health**—2 reels—a dramatization of the importance of immunizing against childhood diseases.

■ **NATIONAL FILM BOARD OF CANADA**, 84 E. Randolph St., Chicago, has prepared two additional films in its *Knife and Fork Series* on wartime nutrition:

**Children First**—2 reels—stressing the importance of milk in wartime diet. The second part of the film deals with milk products and derivatives such as cheese, butter, milk concentrates and condensed milk. Housewives are urged to guard against waste. Milk must be conserved and shared to meet the urgent demands of wartime.

**When Do We Eat?**—2 reels—which is concerned with proper nutrition for industrial workers. This film presents a good and well-balanced food program which the worker needs to maintain maximum strength and energy, thus reducing industrial accidents and the sick rate. Factory managers are urged to improve the eating facilities of their employees.

■ **IDEAL PICTURES CORPORATION**, 28 East Eighth St., Chicago, have just issued a large, impressive Silver Anniversary film catalogue commemorating Ideal's 25 years in business. The 128-page volume offers a wide selection of material in all of the four categories into which the films are grouped, namely: General Catalogue of 16mm Sound Subjects, Religious Catalogue in 16mm Sound, The Educational Catalogue in 16mm Sound, Catalogue of Silent Subjects in 16mm and 8mm.

46 pages are devoted to descriptive listings of feature pictures from Universal, RKO, and other Hollywood studios. Latest major productions which will be released this Fall by Ideal are:

**As You Like It**—starring Lawrence Olivier and Elizabeth Bergner.

**Duke of West Point**—starring Joan Fontaine and Richard Carlson.

**King of the Turf**—starring Adolph Menjou and Dolores Costello.

**International Lady**—starring George Brent and Ilona Massey.

**South of Pango Pango**—starring Victor McLaglen and Jon Hall.

Films in the educational section are classified into subject-groups, such as Animal and Marine Life, Art and Architecture, Astronomy, Aviation, Geography and Travel, Handicrafts, History, Industrial Education, Literature, Safety and Health, etc. Many war subjects are also offered.

A copy of this new catalogue can be obtained from Ideal's Chicago office, or from its eleven branch offices serving various areas of the country.

#### Entertainment Releases in 16mm

■ **WALTER O. GUTLOHN, INC.**, 25 W. 45th St., New York, offer some of Hollywood's most popular productions in their current releases of major feature films, which include:

**The Amazing Mrs. Holliday** (Universal)—presenting Deanna Durbin as a dramatic actress as well as songstress. The story sweeps from war-torn China to San Francisco's Nob Hill.

**Topper**—a merry comedy dealing with the escapades of Thorne Smith's character with Roland Young in the

title role. Cary Grant and Constance Bennett are the two ghosts who put Topper through his paces.

**Flight for Freedom** (RKO)—with Rosalind Russell and Fred MacMurray. This film combines a love story of an

ace flier and famous aviatrix with Japanese espionage.

**Forever and a Day** (RKO)—tale of a house in London built in 1804 and of the people who lived in it down to the present war, acted by an all-star cast.

**The Great Gildersleeve** (RKO)—the radio star Harold Peary, in his first screen comedy.

**It Ain't Hay** (Universal)—Abbott and Costello in a Damon Runyon story about a horse that has seen better days.

■ **BELL & HOWELL CO.**, 1801 Larchmont Ave., Chicago, announce the addition of many new Universal features to their Filmsound library, among them:

**It Comes Up Love**—with Gloria Jean and Donald O'Connor in a fast-moving comedy involving mainly 'teen-agers.

**Hi Buddy!**—a story dealing with current everyday affairs and war problems,

featuring Dick Foran, Harriet Hilliard and a cast of sub-teen juveniles.

**Rhythm of the Islands**—singing and dancing on a synthetic "Paradise Island", maintained to bolster tourist trade.

**He's My Guy**—human relations comedy-drama in which vaudeville performers stage morale-building shows in defense plants. Cast includes Joan Davis, Gertrude Niesen, Mills Brothers.

■ **COMMONWEALTH PICTURES CORP.**, 729 Seventh Ave., New York, control exclusive 16mm rights to three feature productions which are now available to libraries. They are:

**That Uncertain Feeling**—a sprightly, romantic comedy with psychoanalyst complications, produced by Ernst Lubitsch. Merle Oberon, Melvyn Douglas and Burgess Meredith provide a triangle situation.

**The Song of Freedom**—starring Paul Robeson in a drama of three continents. After his singing is overheard by an impresario, a London Negro dockhand sky-rockets to world fame, enabling him to realize his life's ambition and return to his people in Africa, whose king he becomes.

**Follies Girl**—a musical extravaganza featuring Wendy Barrie and four radio name bands. The heroine, a costume designer for a Broadway show, has some hilarious adventures and a romance with a soldier.

# AMONG THE PRODUCERS

## Ampro Joins with General Precision Equipment

General Precision Equipment Corporation, 92 Gold St., New York, has acquired control of Ampro Corporation of Chicago, one of the well known manufacturers of motion picture projectors for 16mm. and 8mm. film. Earle G. Hines, president of General Precision Equipment Corporation, in making the announcement stated that the acquisition was for cash, that no new stock of General Precision Equipment will be issued in connection therewith and that the present management of Ampro will continue in charge of operations. This development makes possible a vastly expanded line of Ampro products which will be distributed through regular Ampro channels as soon as war conditions and time permit.

Some of the subsidiaries of General Precision Equipment Corporation have long been the leading manufacturers of standard 35mm. motion picture equipment for theatres but have not made 16mm. and 8mm. film equipment. In October, 1943, General Precision Equipment Corporation acquired all of the stock of Motion Picture Engineering Corporation of Chicago which company specializes in projection equipment for industrial and commercial uses.

"With the acquisition of Ampro Corporation, the motion picture activities of General Precision will now include apparatus covering not only the professional 35mm. field, but also the requirements of 16mm. and 8mm. equipment for uses by educators, industry and the amateur or 'home movie' enthusiasts," Mr. Hines said. "Thus the products will cover the complete range of equipment for motion picture projection. Other related equipment such as 16mm. and 8mm. cameras will be added when war activities cease and such development programs can be undertaken.

"During the war period the use of 16mm. motion picture film and projection equipment has been tremendously expanded since all branches of the armed services have used it for training programs, for extension teaching and for entertainment. The value of motion picture instruction films has long been recognized by some of the leading schools of the country. The successful use by the armed forces on a great and varied scale has shown educators and industrial concerns as never before, the rapidity with which information can be imparted to groups of students by this method. Undoubtedly use of visual aids in educational programs will, when peace comes, be greatly stimulated by this experience."

## Bell & Howell Products

Opti-kleen, a new lens cleaning fluid, has been launched by Bell & Howell, 1801 Larchmont Ave., Chicago, to meet the problem of efficiently cleaning sur-

face-coated glass. A reflection-reducing process, surface-coating was introduced as a wartime necessity, and will be a peacetime "must." Opti-kleen is especially designed to keep pace with this lens improvement. Reflection-reducing coatings may be severely damaged by the use of a cleaning material containing wax, so Bell & Howell laboratories brought forth this doubly-effective solution for any lens or finder cleaning, acclaimed superior due to the absence of all solids, which eliminates the possibilities of residue from the cleaning fluid being left on the surface of the glass.

A new film cement, another product perfected recently by Bell & Howell Company, offers important advantages—greater tensile strength, no deterioration other than that to be expected by evaporation of any solvent of like drying time; no attack on the cork and the material is not corrosive. The new cement has the added feature that it may be used "For All Motion Picture Film," both acetate and nitrate.

## Da-Lite Versatol Screen

One of the few projection screens with metal mountings which can now be sold without priorities is the Da-Lite Versatol tripod model, which is available in three sizes with retail prices ranging from \$7.50 to \$10.00.

The Versatol Screen is a one-piece, self-contained unit and has safety features (to protect the fabric) similar to those found in the Da-Lite Challenger. It is lighter in weight and less costly in design than the Challenger, but fills a need for brilliant picture quality and convenience at a moderate price. Like the Challenger, it can be adjusted in height without changing the picture proportions of the screen. The case and screen are

raised as one unit. The Versatol folds compactly for easy carrying and storing. The fabric has Da-Lite's glass-beaded surface which reflects maximum light without sparkle or glare and is the most practical for all average viewing

## AnSCO Introduces New Color Film

A new color film which can be processed by the user in ninety minutes with only fifteen minutes spent in total darkness, was introduced to the public by AnSCO in a demonstration at the Waldorf-Astoria in New York June 22. The film, which was perfected by AnSCO of Binghampton, New York, at the request of the Army and Navy, and heretofore has been available only to the armed forces and war industries, is now being distributed in sheet film and 16mm motion picture film to the public of the metropolitan New York area. Distribution will be expanded further as rapidly as possible.

Color photographs were taken and processed during the course of the demonstration. Slides made on the new color film, giving the inside story of what happens within the film in order to produce the color transparency, were also shown.

Chief among the attributes claimed for the new color process is its faithfulness of color reproduction, even in pastels, its long color scale, and the fact that it can be processed by the user in an hour and one-half. Its speed in handling has already been used to advantage by press associations throughout the world in covering Allied battlefronts.

## New Edition of Covarrubias Mural Maps

A fourth edition of the famous Covarrubias mural map reproduction is announced by Schwabacher-Frey, 735 Market Street, San Francisco 19, California. The original murals were the feature of the Pacific House at the 1940 Golden Gate International Exposition in San Francisco. The reproductions require nine separate printings in order to faithfully produce all the subtle color values employed by the artist. To give them maximum effectiveness as visual instruction, compilation of the maps was done with the utmost thoroughness. The result is a pictorial encyclopaedia of Pacific ethnology, economy, art, botany, zoology, native housing and transportation.

The complete set of six Mural-Map reproductions comprises: Peoples of the Pacific, Flora and Fauna of the Pacific, Art Forms of the Pacific, Economy of the Pacific, Native Dwellings of the Pacific, Native Means of Transportation, and range in size from 25 x 19 inches to 38 x 25 inches. An explanatory text pamphlet accompanies the maps.

## Radiant's New Folding Screen

A new "Fold-Pak" screen, made from a newly developed durable and flexible screen fabric, is being manufactured by Radiant Manufacturing Corporation in sizes from 7"x9" to 20"x20" which fold into a small, light carrying bag in briefcase form. The special fabric is made to stand rolling, folding, creasing, and washing without cracking, peeling, or discoloring. It is said to be fungus resistant and impervious to grease, oil and light. Provided with metal grommets in a strong reinforced webbing on all four edges, it can be used in two ways—be hung up quickly or stretched to a special spring frame, which can again be folded into a carrying bag for easy transportation. The opened screen presents a flat, unwrinkled surface for projection. The new model is recommended for indoor or outdoor showings under any climatic conditions.

Descriptive folders and screen fabric sample are available from Radiant Manufacturing Corporation, 1141 West Superior Street, Chicago.

## DeVry Offers Travel Kodachromes

More than 700 Kodachrome transparencies comprising a collection of 2 x 2 slides of scenic points of interest in the United States, Canada, Mexico, Hawaii and Latin America, are now available from DeVry Films & Laboratories, 1111 Armitage Avenue, Chicago. Each subject is covered by six slides which are sold only in sets, at \$3.00 per set. Colorful literature is available free.

## S.O.S. Expands

Two floors in the building at 450 West 42nd Street directly across the street from its present location, have been leased by S. O. S. Cinema Supply Corp. The concern has been expanding during the past two years, now occupying two floors at 449 West 42nd Street and a manufacturing plant at 452 West 46th Street, which is devoted 100% to war production.

## Thomas Hodge Transferred

Mr. Thomas Hodge, formerly Film Officer for the British Information Services serving the Midwest from Chicago headquarters at 360 N. Michigan Avenue, is now head of Theatrical Section of the Film Division of British Information Services at 30 Rockefeller Plaza, New York.

Succeeding Mr. Hodge in the Chicago office is Mr. John Hamilton, formerly assistant director of the Visual Education Department, University of Minnesota.

## Midwestern Forum

(Concluded from page 311)

long as education is financed locally with only a limited amount of state support, in most states it will be difficult to reach even an annual budget of \$30 per teacher. Unless schools receive additional financial support, Mr. Larson warned, those agencies which tap the wealth of the nation will probably subsidize educational films and, thus influence what we teach. He emphasized the need, therefore, of joining forces with other educational organizations in urging federal aid for public education.

### Who Will Evaluate and Use Them?

Mr. E. C. Waggoner, Director of Science and Visual Instruction, Flgin High School, Illinois, discussed this angle of the educational film field, stressing the importance of proper utilization and checking up on the results obtained. Certain objectives must be kept in mind in using visual aids. Many of them have been prepared to meet certain objectives and in the evaluation of visual aids, we must be ever mindful of the purposes for which they were made.

In 1936 Mr. Waggoner was commissioned by a large corporation to make a survey in five states on the number of 16mm projectors owned by the schools, the type of films used, and the source of the films. He found that not one school in ten made an effort to utilize the visual aids then available in any organized scientific manner. Although this ratio is doubtless higher today, he wondered whether much real progress has been made since that time, citing a deplorable sample of the utilization of classroom films which he had witnessed only a few months ago in a progressive high school. In one school system he found the teachers indifferent to an expensive visual set-up. The reason for this, he believed, was two-fold: (1) they were inadequately paid, and (2) very little provision had been made for an educationally sound program in which maximum use might be made of these visual tools. Some one in all school systems, he advocated, should be assigned the task of administering the visual program as only through qualified, centralized administrative direction can an effective audio-visual program continuously meet the requirements of the post-war period. With close cooperation among those who evaluate, those who produce and those who use, we can anticipate the ever-growing demand for good teaching tools.

Among the good things  
to look forward to in  
**OCTOBER—**

*The New*  
20TH EDITION of

**"1000 and ONE"**

*The Blue Book of Films*

As the use of the motion picture for informative and instructional purposes becomes more extensive and intensive, this annually published, authoritative film reference is increasingly in demand as an indispensable source of information on available subjects.

For years "1000 and ONE" has been a MUST on the desks of the most active users of films in the classroom, the auditorium, in industry, religious work, clubs, community work, etc. You, too, whether you use films seldom or often, will welcome the unique, practical services of the directory in informing you as to the subjects available for your needs, and the sources from which they may be procured.

### Order Your Copy Now!

More than 5,000 films are listed and described in the 20th Edition, carefully classified into 178 different subject-groups. It lists hundreds of new subjects made available since the 19th Edition appeared last Fall. Make sure you receive a copy immediately the new edition is off the press by sending your order NOW!

**PRICE 75c**

**But if ordered with a  
subscription to  
Educational Screen**

**IT COSTS ONLY 25c**

\$2.25 will bring you the magazine for one year and copy of "1000 and One"; \$3.25 pays for a two-year subscription and copy of "1000 and One".

## and a Spencer VA

Modern visual education methods call for *both* a blackboard and a Spencer VA Delineascope.

The VA Delineascope is a versatile instrument which can be used to project lantern slides as well as appropriate pictures and text from current magazines, newspapers and books.

It is an aid to teachers and pupils alike. Material projected through it has a dramatic force that arouses and holds the attention of the entire class. It pays for itself many times over by improving grades and reducing failures.

Write for our teachers' manual, "Opaque Projection." It presents new teaching techniques.

**Spencer** LENS COMPANY  
BUFFALO, NEW YORK  
SCIENTIFIC INSTRUMENT DIVISION OF  
AMERICAN OPTICAL COMPANY

An unusual innovation in teaching methods

THE NEW KEYSTONE

Overhead Projector

- A short-focus lens brings the instructor, the projector and the slide together at the front of the room.
- The slide is visible on the slide table before the teacher, which enables her to discuss its content while facing the class. When one slide is pushed over the projection opening, it pushes the previous slide off.
- The teacher can write or draw on the etched glass placed on the slide table and the development of the lines of writing or drawing is reproduced on the screen.
- Ideal for the use of the Flashmeter, as it makes feasible, through the use of a slotted screen device, the showing of individual words, phrases, or sentences from a slide consisting of several lines.
- The lamp house is air-cooled by a motor-driven fan, which prolongs the life of the lamp and prevents the breaking of condensing lenses and slides.

# Now-NEW VISUAL AIDS FOR CLASSROOM USE

Over 250 U. S. Office of Education Motion Pictures and Filmstrips Available

- ★ Each subject a complete visual unit—16mm. sound motion picture, filmstrip, and instructor's manual.
- ★ Supervised and produced by visual training specialists of the U. S. Office of Education.
- ★ Low priced—as little as \$15 a subject.

## A FEW OF THE WIDE VARIETY OF U.S. OFFICE OF EDUCATION FILM SUBJECTS

### ENGINEERING

- 179 Slide rule
- 173 X-ray inspection
- 174 Measurement with light waves
- 175 The Electron

174 Measurement with Light Waves

### FARM WORK

- 199 Sheep shearing
- 454 Care of a Tractor
- 460 Repainting a frame building
- 458 Horseshoeing

199 Sheep Shearing

### NURSING

- 412 Care of the New Born Baby
- 404 Feeding the Patient
- MN-1511-g Taking Blood Pressure
- MN-1511-i Temperature, Pulse and Respiration

412 Care of the New Born Baby

In the new U. S. Office of Education series teachers have films dealing with virtually every course of study given in the nation's schools. These films are expertly made, professionally filmed, and have a tested efficiency in "showing how." Each forms a perfect supplement to a given course of study. Over 250 films and filmstrips are available now. Send for catalogs!

### 22,000 U. S. O. E. FILMS SOLD

Since November 1941, when the first Office of Education training films were released, 22,000 prints have been sold to war plants, vocational schools, colleges and universities, and other civilian users.

## THE UNITED STATES OFFICE OF EDUCATION

**NOW** you can place your order for a

**DEVRY  
PRECISION  
16mm. Sound-on-Film  
PROJECTOR**

**Y**OUR turn has come to place your order for the sound motion picture projector you've wanted—and needed—perhaps badly.

But don't be too leisurely about doing so... A LOT OF PEOPLE HAVE BEEN WAITING TO GET THE DEPENDABLE, PRECISION DEVRY—and orders placed now assure priority when it comes to delivery.

A lot of people have been looking forward to owning the projector that is built like a fine watch—the projector that insures a brilliant, sharply focused image—the projector powered by a steady, smooth-running mechanism that purrs through reel after reel without a flicker or a jump—the projector that is so simple, a student can operate it—so ruggedly built, you are assured years of continuous, trouble-free service.

And when it comes to *sound*, DEVRY gives you theater-quality reproduction—its full, clear musical tones and distinct speech leave nothing to be desired.

You who have been longing for the finest projection equipment made—that is simple and easy to operate, to clean and maintain—a "scratch-free" instrument that will project your valued films SAFELY, time after time, day-in, day-out—fill out and mail the coupon below. Colorful literature will be sent you—FREE.

- DevRY Model 16—1966 Sound-on-Film Projector shown above has 1,600-ft. film capacity, and projects either sound or silent film. *Equipment worth waiting for.*
- Projector is housed in its own "blimp" or silencing case. Another balanced case contains 12-inch Electro-Dynamic Speaker and powerful 25-watt Amplifier. Speaker case provides ample room for films and accessories. *Extremely portable!*
- Amplifier and Speaker can be used separately, with microphone or phonograph, as Public Address unit for public speaking, dramatic classes, athletic and other events. *Double value.*
- DevRY Projectors are guaranteed against defects in material and workmanship... They are approved by Underwriters' Laboratories. *Safe.*
- You get the same high-quality materials, the same craftsmanship, the same meticulous skill required for DevRY 35-mm. theater equipment.
- DevRY 16mm. Sound-on-Film Projectors are precision electronic instruments.

**BUY WAR BONDS!**

AN OUTSTANDING NAME IN THE FIELD OF VISUAL EDUCATION

*DevRY is the Only Manufacturer of Motion Picture Sound Equipment to have Received the Army-Navy Excellence Award Three Consecutive Times.*

**THESE PROJECTED TEACHING AIDS ARE NOW AVAILABLE FROM DEVRY**

**DEVRY TRIPLE-PURPOSE SLIDEFILM PROJECTORS** for (1) 2 in. x 2 in. Paper or Glass Slides; (2) for Single-frame Slidefilm; and (3) for Double-frame Slidefilm. Motor driven, forced-air-cooled. Non-rewind design eliminates rewinding. Uses 300, 200, or 100-watt lamp. Feed capacity up to 300 single-frame pictures. Compact, sturdy—easily carried. *See DevRY before you buy.*

**DEVRY PORTABLE PROJECTION SCREENS**—a complete line of glass-beaded Motion Picture Screens distinctly superior in ease of operation and portability. Pictured model is adjustable to ANY position. Square models instantly convertible to rectangular sizes. DevRY screens in sizes from 30 in. x 40 in. to 20 ft x 20 ft. *Write for literature.*

**FILMSETS'** 200-ft., 16mm. Silent Motion Picture Films for Intermediate Elementary Grades. 22 subjects in Economic (Food, Shelter, Clothing), and 26 subjects in Regional (Place) Geography. Available—one reel, or as many as you may wish—complete with 112-page Teachers' Manual containing 672 carefully selected illustrations from the films... Each 2-page spread a lesson outline. *Colorful literature free.*

**DEVRY FILM LIBRARY**—Be sure you have DevRY'S big, NEW Film Book—comprehensive tabulation of carefully selected 16mm. sound and silent films particularly suited for classroom teaching. Also selected short subjects, full-length features and comedies. *Make DevRY your classroom film source.*

**DEVRY KODACHROME COLOR SLIDES**—Ask us about 750 NEW Kodachrome Color Slides—of scenic points of interest in the United States, Canada, Mexico, Hawaii, Latin America, and the Continent. Valuable aids to teaching children. **FOR PRIMARY GRADES:** write for information about *Disney Cartoon Slides in color.*

Plan now to include  
these important RCA  
**TEACHING TOOLS**  
in your post-war  
school improvement  
program

**RCA 16MM. SOUND MOVIE PROJECTORS**—The New RCA 16mm. Sound Projector for Schools, when available, will include many important advances in projector design, such as even-tension take-up; removable gate for easy projector aperture cleaning; centralized controls; rewind without changing reels; one-point oiling, etc. Because of military demands these new RCA projectors are not available now for civilian use. But be sure to see the new RCA projector at your RCA dealer's showroom before you purchase post-war equipment.

**RCA SCHOOL SOUND SYSTEMS**—RCA School Sound Systems provide a simple means for quick, easy distribution of radio programs, phonograph recordings to any or all rooms of a school. An RCA Sound System also serves as a communication center from which the School Administrator, his assistants or members of the faculty, or student body can effect instant contact with any or every part of the school. Student interest can be greatly stimulated in the social studies, drama, music, and other subjects through the use of simulated broadcasts.

**RCA—"FM" RECEIVERS AND TRANSMITTERS**—RCA has been and will continue to be a leader in the development of "FM". While the war has stopped production of FM transmitters and receivers for civilian use, those connected with school management will certainly want to learn about "FM" to help them do a better job of post-war planning. A letter or postal card addressed:—The Educational Department, Radio Corporation of America, Camden, N. J., will bring information about this new type of broadcasting.

**RCA—VICTOR RECORDS AND RCA PLAYERS**—Already well established as an extremely useful teaching tool, Victor records and RCA-Victor record players are growing more and more popular in classroom work. Thousands of records are available to help teachers in music, speech, drama, foreign languages, history, literature and many other subjects. RCA Recording Equipment permits the making of instantaneous disc recordings of group or individual student programs. Recordings can also be made of incoming radio programs.

Other RCA Teaching Tools

RCA Test and Laboratory Equipment provides a way in which students can understand more quickly and thoroughly the fundamentals of electronics as they are applied in radio, television and other fields. The RCA Electron Microscope, far more powerful than the finest optical microscopes, will be "must" equipment for most schools after the war.

**RADIO CORPORATION OF AMERICA**

RCA VICTOR DIVISION • CAMDEN, N. J.

# Tested in a Worldwide Laboratory

On far-spread fighting fronts Ampro 16 mm. sound projectors have been subjected to the most rigorous tests ever devised. As an integral part of the training and entertainment equipment of the armed services, these machines have had to stand steaming, corroding humidity—congealing, sub-zero temperatures—dust storms and jarring vibrations—plus day after day operation with a minimum of service facilities.

Add to this more than a decade of pre-war experience in building 16 mm. projectors for thousands of schools, universities, industrial concerns, government agencies, churches, clubs and homes the world over—and you will understand why Ampro provides continuous, efficient operation under the most adverse conditions.

For full details on Ampro 8 mm. and 16 mm. projection equipment, write to Ampro Corporation, Chicago 18, Ill.

# Announcing

THE 20th EDITION

# "1000 and ONE"

1944-45

The Blue Book of Non-Theatrical Films, EDUCATIONAL SCREEN's annual Directory, was originally announced for production on October 15. Increased editorial work, necessitated by the large numbers of new war films, and wartime paper and printing difficulties have resulted in a three weeks delay.

The published price of the 1944-45 edition of "1000 and One" is

**\$1.00 per copy**

This Standard Reference Tool lists more than six thousand answers to that perennial and puzzling question, "Where will I find a film on this subject?" Classified in five Indexes, under 176 descriptive headings, and indicating producers, main sources, size and length of film

"1000 and One" will be more than ever *The Indispensable Tool* for all teachers, administrators, supervisors, directors of visual education, program chairmen, and producers and distributors of non-theatrical films.

## Free Introductory Offer

ONE FREE COPY of "1000 and One" will be mailed to all regular subscribers of EDUCATIONAL SCREEN whose requests for such copies are received before November 30. This will include subscribers who have already sent in advance orders at the originally announced advance price to EDUCATIONAL SCREEN's subscribers, and all money sent in with such orders will be returned.

WE URGE EVERY SUBSCRIBER TO TAKE ADVANTAGE OF THIS FREE OFFER. WE CALL IT AN INTRODUCTORY OFFER because we want you to INTRODUCE "1000 and One" to your colleagues.

## Don't Be Disappointed

This Introductory Offer Expires November 30  
and is available only to subscribers to

**THE EDUCATIONAL SCREEN**

64 East Lake Street

Chicago 1, Illinois

## *Editorial*

### *The Challenge of Maturity*

**V**ISUAL education should now begin to realize the possibilities latent in it from the beginning but long dormant under academic inertia and learned indifference. The great achievement in war training by visual methods has administered a most wholesome jolt to scholastic complacency. The Army—Navy—Airforce programs have revealed no new truth. The power of the picture, in all forms used by the armed forces, has long been known to many in the teaching field, even though largely ignored. But the war services have done a priceless favor to American education at large by putting the truth into action, on a gigantic scale, before the eyes of the whole national public both lay and professional.

The armed forces had, to be sure, every possible advantage toward making a success of their visual teaching—financial resources unlimited . . . relative maturity in the students . . . utmost incentive to learning, even of "life or death" . . . discipline by military law, not by moral suasion . . . hours-per-week-per-subject as desired . . . and, above all, a rigidly condensed curriculum of limited range, concrete in subject-matter, broken down into specific topics in closely circumscribed areas. It was a very special curriculum for a highly specialized teaching task. It sought intensified learning for immediate utilization. It aimed wholly, and properly, at functional and vocational, not general and cultural training. To teach the action of a gas engine is far from giving a general engineering course. Ballistics and navigation are but details in the vast fields of Physics and Mathematics. In Language the aim was swift mastery of a small work-a-day vocabulary for elementary communication, with no glimmering of the literature or preparation for intelligent conversation. The graduates can certainly ask directions, order meals, tell time, secure lodgings, but they can hardly express a significant opinion on anything.

By ignoring the above obvious considerations which made the war training a decidedly "special situation," it was possible to write, in fine, educational journalese, the famous and endlessly reprinted "Can Schools Teach the G. I. Way?" without reaching the obvious answer "Yes, by becoming training camps." But despite its warp of misconception and woof of misinterpretation that ubiquitous masterpiece has vastly implemented the already powerful influence of the military example. It has fallen under millions of eyes, and stimulated thinking on things visual in countless minds throughout the nation. This stimulus, once the minds have sifted the facts from the flippancies, will lead to action in many quarters hitherto quiescent. Thus a printed effusion that made the judicious grieve and thousands cheer contributes to the impetus that will push visual education across the threshold of maturity.

We have now, we think, sufficiently emphasized our conviction that World War II will serve, conveniently and logically, to mark the end of adolescence and the beginning of maturity for the visual field. The first requirement of maturity is graduation from immaturity. This is a challenge to the visual field to discard its swaddling clothes, pinafores and knee pants, and to stand forth in adult garb. It is equally a challenge to the one educational magazine devoted solely to that field to assist this change by fuller and wider service than it has ever rendered before. Both challenges will be met.

This coming-of-age for visual education can be neither instantaneous nor automatic. Time and reflexion will be required to make selections for discard, for modification, for addition, in the present-day economy. In both materials and methods there is much "old" to be junked, and there will be more and more "new" to be accessioned. A transition period, long or short, is inevitable. At least three factors will tend to lengthen that period: (1) the wide extent of the still undeveloped field, (2) the habitual money-shortage, real or imagined, in the schools, (3) the chronic drag and lag of educational tradition. The greatest single factor to counterbalance all these, and shorten greatly the transition period, will be an adequate medium for full and free intercommunication between all elements involved—the thinkers who plan, the consumers who use, the producers who create and supply. It is vital that teachers, administrators, producers, distributors, speakers, writers, research workers be able to learn of each other's ideas and achievements. When the right hand knows what the left hand is doing we can save enormous duplication of effort and repeated trips up blind alleys. Our visual literature can outgrow its ingrained habits of repetition, platitude and cliché. Even that immortal fossil, "the old Chinese proverb"—about one picture being worth from 1000 to 10,000,000 words, depending on the writer quoting it—may finally be brought to a long and well earned rest.

That essential medium will be a strong periodical, ably managed, adequately staffed, with large and national circulation and a wealth of content ample to meet all needs of the growing field. To supply such a magazine is a challenge of the first order. The EDUCATIONAL SCREEN accepts that challenge.

#### *A New Publisher*

**T**HE all-important first step toward greater service to the visual field has been taken. With keenest pleasure we announce that Donald P. Bean assumes full charge as Publisher of the EDUCATIONAL SCREEN from the opening of the school year 1944-45. His long experience in magazine and book publication as Director of the University of Chicago Press, his publishing of

the famous series of visual textbooks by leading members of the Midway faculty, his handling of the early Erpi-Chicago film distribution, his years as Director of Interpretation at Colonial Williamsburg, his recent notable service in the commercial field as Educational Consultant for NAVED, and finally his nation-wide personal contacts with outstanding figures in the educational, visual, and publishing fields—all these are rare qualifications for his newly chosen task, namely the building of EDUCATIONAL SCREEN into the medium needed by the visual education field.

### **Emphasis on Curriculum Research**

EDUCATIONAL SCREEN is also pleased to announce that Walter A. Wittich of the University of Wisconsin is the latest addition to the staff of its departmental editors. Dr. Wittich will write articles on curriculum research and will edit a new department of the periodical reviewing all studies in this field. Dr. Wittich's own important studies and his recent appointment as the acting Director of Bureau of Visual Instruction of the University of Wisconsin's Extension Division give real significance to this announcement. Dr. Wittich's first article on curriculum research will appear in the November issue of EDUCATIONAL SCREEN.

### **An Instructional Materials Center**

THE University of Chicago makes the important announcement of the establishment of a "Center for Research on Audio-Visual Instructional Materials" as a part of the Department of Education. The plan is unique and holds interesting potentialities for the promotional of visual instruction.

Numerous functions will be assigned to the Center. It will give graduate students and faculty members a headquarters for visual research. Teachers and administrators from outside institutions can come, for visits of any length, to examine the latest developments in audio-visual material. The Center will set up a system for gathering qualified opinions from all parts of the country to determine what subjects should be filmed for the curriculum, and to review the proposed content for each film.

The Center will organize research projects on numerous topics: The effect of having different narrators in a sound film upon learning and retention; the desirability of developing film techniques that provoke pupil participation; how make motion pictures bring about maximum subsequent learning activities; relative values of color and non-color in films on various topics; the values of sound and silent films dealing with exactly the same material, etc., etc.

An example of such research is already under way by the Center. An Encyclopedia Britannica film, "Common Animals of the Woods," has been produced with straight narrative accompaniment. Another version has been made in which the accompanying voice asks questions on the picture and pauses to give classes time actually to answer. The two versions will be widely used in experiment, results tabulated, and conclusions reached as to relative teaching value of the two types of vocal accompaniment.

Another problem—proper classroom utilization—will

be a major concern of the Center. Expert demonstrators will operate in schools; courses will be given at the Center; researches will be set-up; advisory service will be made available to interested schools and administrative bodies throughout the country.

The possibilities of valuable service from such educational activities give this announcement unusual significance at this time. N. L. G.

### **The Sixth War Loan**

NOVEMBER 7 will decide the occupancy of the White House, but it will not win the war. November 20 is the date set for the beginning of the home front's most critical campaign. The importance of that campaign and the role which films can play in its successful prosecution are outlined in the article, "Visual Education's Immediate Job" by EDUCATIONAL SCREEN's new publisher, which will be found on pages 348 and 349 of this issue.

Merriman Holtz, a leading visual education dealer on the West Coast, and First Vice-President of the National Association of Visual Education Dealers, has been persuaded by the Treasury Department to leave his business for three months for the purpose of directing the 16mm. film activities for the Sixth War Loan Drive. The important role of state chairmen appointed for the Drive is outlined in the article. The following national advisory committee has been appointed to assist in the Drive:

#### **National 16mm War Loan Advisory Committee**

- Chairman*—Horace Jones, Victor Animatograph Corporation, New York, N. Y.  
*Secretary*—Murray Goodman, Castle Films, New York, N. Y.  
 Wells Alexander, The Distributors' Group, Inc., Atlanta, Ga.  
 B. A. Aughinbaugh, State Supervisor of Visual Education, State Department of Education, Columbus, Ohio.  
 Donald P. Bean, Educational Screen, Chicago, Ill.  
 Camilla Best, War Film Coordinator, New Orleans Public Schools, New Orleans, La.  
 Thomas Brandon, Brandon Films, Inc., New York, N. Y.  
 O. H. Coelm, Jr., Business Screen, Chicago, Ill.  
 Bruce A. Findley, Supervisor Visual Education, Board of Education, Los Angeles, California.  
 C. A. Fisher, President, National University Extension Association, University of Michigan, Ann Arbor, Mich.  
 Eric Haight, Films, Inc., New York, N. Y.  
 Harry Kapit, Walter O. Gutlohn, Inc., New York, N. Y.  
 William F. Kruse, Bell and Howell Company, Chicago, Ill.  
 L. C. Larson, Chairman, Educational Film Library Association, Indiana University, Bloomington, Ind.  
 W. H. MacCallum, Modern Talking Picture Service, New York, N. Y.  
 Richard F. O'Neil, President, National Association of Visual Education Dealers, Visual Education Service, Boston, Mass.  
 Frank Rogers, Jr., Ampro Corporation, Chicago, Ill.  
 Russell C. Roshon, New York, N. Y.  
 A. Wertheimer, Radiant Mfg., Co., Chicago, Ill.  
 Bertram Willoughby, Ideal Pictures Corp., Chicago, Ill.  
 Col. H. L. Winton, Movie Makers, New York, N. Y.
- A series of regional meetings of both national and state committees are now in progress under Mr. Holtz's guidance. Now IS the time for all school people to come to the aid of their country.

# It Can Be Done

*A suggested method for diverting "entertainment" habits into effective classroom habits.*

DR. W. A. WITTICH

Acting Director\*, Bureau of Visual Instruction  
University of Wisconsin, Madison, Wisconsin

WHY do we as adults attend motion pictures by the tens of millions each month? Why are we so enthusiastic about pushing our half dollars through the ticket window for the privilege of watching fiction, biography, current events and news paraded before us in a series of flickering shadows of light and shade? Is it because of our love of adventure, or is it because of our inherent wish to seek some means of escape from realities which so ruthlessly press us? Or are these one and the same? Do we love adventure because it does offer escape from reality?

Perhaps, just as the psychologist says of the comic strip, we love comics because reading them gives us an opportunity for self-aggrandizement as we survey as critics the ridiculous antics of the comic strip character. Or, as we read them, we can secretly identify ourselves with the romantic accomplishments of the heroes. Similarly, the entertainment films give us opportunity for release, opportunity for identifying ourselves with heroic action and adventure, and opportunity to escape care for a few brief hours of association with dreams, unfulfilled ambitions, and heroic flights of fancy. That adults are not the only ones addicted to the entertainment film is evidenced conclusively by the studies sponsored by the Payne Fund in the early 1930's and substantiated again and again since that time by psychiatrists, doctors, and social workers.

Thus it is that the entertainment film has made for itself and established for itself a lasting impression upon the conscious and subconscious thinking of some 130,000,000 Americans. Thus it is, also, that the school child finds himself tremendously influenced by his associations in the world of the entertainment film; and so it naturally follows that, when the sound film is used in educational or classroom work, the heritage of Hollywood, this tremendous impression built up through association with romantic fantasy, leaves its indelible impression, and influences children's relationships with films in any form.

It is not to be thought strange that, when the announcement goes out to children whether they be at the primary, intermediate, junior or senior high school level, the reaction is often: "Hurray! We're having a movie!" or "Good! No school this afternoon! We're having a movie!" or "A movie? Swell! Who's in it?" But imagine their chagrin, even the shock, when they find that in contrast to technicolor, adventure, and dazzling heroines, an 8-minute black-and-white sound film on "City Water Systems" or some allied text-film subject is presented. In many cases the teacher herself is under the spell of the Hollywood heritage, not

that there is anything wrong with it in and of itself but rather that its influence upon the classroom and the children in it is to be reckoned with.

Let's see how this influence may operate in a classroom where the teaching or text film is introduced. When the child recognizes that instead of a western thriller he is confronted with a film in which heroes and heroines are absent, he is apt to experience any number of feelings ranging from boredom to resentment at being "let down." If he should be asked to respond to a testing situation which may grow out of seeing the film, his reaction may be even more marked. In short, the teacher is confronted by the typical child who has grown up under the impression that movies are entertainment, relaxation, freedom from work, or a Saturday afternoon at the downtown theater. To this child it makes little or no difference at first that the true educational sound film or text film is a vitalized experience in learning, learning which has heretofore been delimited and often inhibited by the inflexible format of texts or supplementary books. It may make no difference to this child that before his eyes 24 frames of pictures are being reviewed each second, that 1,440 of these frames are blending themselves each minute to make up the motion he witnesses. He may little realize that, through the medium of the 14,400 separate pictures which have been paraded before him during a ten-minute sound picture, the doors of a text-book bound geography are being opened wider and new vistas are being released upon his consciousness in all their authenticity, in all their reality, with all their environment sounds, in an effort to reveal to him a picture of life as it actually exists in the far-off Congo, on the steppes of Russia, or on the rocky, wind-swept shores of the Aleutians.

From my own experience, I can cite the existence of a great barrier among children when attempting the transition from the "entertainment" habit to the text or teaching film attitude. During the past year we secured a projector, good films, and specific text-film subjects which were curricularly valid to the course of study being pursued. The films did a clear and vivid job of explaining scientific laws and concepts which are often confusing to children. The films were announced, shown, discussed, reshown, and then followed by an evaluation in the form of a prepared 50-item objective test. Several children were noticeably bored and a few were actively disinterested. I chose one boy who was known for his honest and uninhibited appraisal of things about school, and we talked over this business of really working at films instead of being

\*Dr. Wittich was formerly Supervisor of Curriculum for the Madison, Wisconsin, public schools.

## Some Implications of the AAF Filmstrip Program

*Telling evidence from war training centers of a larger role for still picture projection in the post-war classroom.*

MAJOR GODFREY M. ELLIOTT  
Training Aids Division, Office of Ass't Chief of Air Staff  
Training Headquarters, Army Air Forces

IT is still too early to write intelligently of the detailed part that audio-visual aids are playing in the military training program of this war, for the very simple reason that no one is yet in possession of sufficient facts. However, it is safe to assume now that when the full story is known, the school will be unable to ignore the significant role which the filmstrip has played in the training programs of the Army and Navy and the consequent implications for classroom teaching. Of all the training aids used by the Army and Navy—and this would include all the familiar visual aids as well as many new ones developed specifically for wartime use—none has been used more successfully in situations closely paralleling classroom use than has the filmstrip.

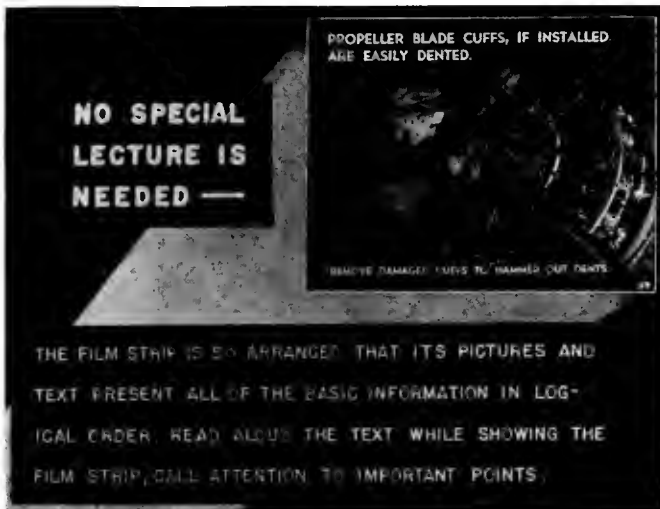

Although no one of the armed services would claim exclusive credit for developing new and improved forms and uses of the filmstrip, the Army Air Forces program of filmstrip production and utilization clearly indicates some of the implications which the filmstrip holds for post-war classroom teaching.

First of all, Training Aids Division, Office of Assistant Chief of Air Staff, Training, in administering and supervising the Army Air Forces training aids program, has attempted to place the filmstrip in its proper perspective with relation to other audio-visual aids. This can best be illustrated by stating the basic premises which have guided the Army Air Forces filmstrip program: (1) the filmstrip is most useful in group situations controlled by an instructor, (2) it is not a preferred medium for presenting technical and mechanical

subjects and (3) the filmstrip is not a substitute for the training film or any other major visual aid, but is a visual aid of major character within its own right.

Second, the Army Air Forces has tried to capitalize upon the inherent advantages of the filmstrip, and through its own filmstrip production units has helped to make the present-day filmstrip a visual aid that is vastly improved over the filmstrip as the school knew it four or five years ago. To those who remember the filmstrip as a series of pictures or drawings not too well related and each with but a word or phrase for identification purposes, it would be a revelation to examine the filmstrip as now produced and used by the Army Air Forces. The filmstrip is now improved both visually and psychologically; each frame is individually planned for visual presentation, and each sequence of frames is planned so that it develops logically the lesson to be taught. Instead of limiting its text material to a few identifying words, the filmstrip now has its explanatory captions and labels especially chosen and arranged so as to make each frame virtually self-explanatory.

The Army Air Forces has deliberately refrained from embarking upon any serious program of sound filmstrips, with the result that less than one percent of its official filmstrip releases are accomplished by sound records. Although a few research studies have indicated that the sound filmstrip is superior to the silent filmstrip under carefully controlled teaching situations, and for certain industrial and commercial uses, the fact remains that the average instructor tends to regard and use the sound filmstrip as a self-contained "canned" lesson, with the result that such an aid immediately becomes only an unsatisfactory substitute for a sound motion picture losing much of the inherent flexibility

(Army Air Forces photos)

(Left) Frame from a filmstrip designed for AAF instructors. (Right) The filmstrip is combined with actual practice.

of the filmstrip and gaining none of the advantages of the training film. This has been the experience of the armed services; whether it will hold true for the classroom still remains to be seen. For similar reasons the Army Air Forces has refrained from the publication of detailed "Lecture Notes" to accompany its filmstrips, holding that the filmstrip should be so constructed as to obviate the necessity for supplementary printed explanation. The preparation of a lecture to accompany the filmstrip, whether recorded on disc or printed in pamphlet form, has in most instances failed to increase the usefulness of the filmstrip to the armed services. Recognizing this fact, the Army Air Forces has attempted to produce its silent filmstrips with just the correct amount of written text contained in each frame—enough text to give the instructor and trainee a basic explanation, but not so much that it burdens the filmstrip with excessive wordage.

Returning to the first of the basic premises stated above—namely, that the filmstrip is most useful in a group situation controlled by an instructor—it has been the experience of the Army Air Forces that filmstrips have been most successful when used in its Technical Schools where the training program closely parallels the school's classroom situation. Whether the Technical School is concerned with training instrument specialists, propeller mechanics, radio and radar technicians, aerial photographers and darkroom technicians, or basic aviation mechanics, it has used the filmstrip to accompany the program of training step by step. It has been found, for example, that while a training film may be of considerable assistance in orienting the trainee at the beginning of a major phase of aircraft propeller mechanics, it is the filmstrip which proves most successful in teaching the details that are to be mastered within each phase. Experience has shown that in most situations the filmstrip is superior to the motion picture, models, or posters in treating subjects which demand detailed study and a considerable amount of supplementary discussion in their presentation, since the filmstrip enables the instructor to hold on the screen those visual details that need intensive study by the trainees. This can in no way be interpreted as meaning that the

other audio-visual aids are any less effective in selected situations; it is to remind one that each major audio-visual aid has certain situations in which it is superior to others.

All of which leads to the rather obvious conclusion that the filmstrip, as used by the armed services during this war, deserves to play a much more significant part in the post-war classroom than it has ever played. Its simplicity, its economy, and its inherent teaching qualities definitely characterize it as one of the major visual aids. Its post-war uses in the classroom can be predicted easily on the basis of its military uses. Certain areas of science and vocational trades, for example, are most certain to provide fertile opportunities for effective use of the filmstrip, as will some phases of geography and other social studies. Its future in the classroom will depend upon intelligent production of filmstrips especially for the classroom and upon their effective use by the teacher, with both factors predicated upon a thorough understanding of what the filmstrip can and can not do.

### Proceedings of Madison Institute

Those who are struggling with programs for visual education meetings in the hope of making them vital and stimulating to large groups of teachers would do well to study carefully the Proceedings of the Second Annual Visual Education Institute held at the University of Wisconsin, Madison, July 17-21, just issued. The thought given to the arrangements for demonstrations and to the detailed program is apparent in the high quality of this record.

The program was well attended and elicited more than usual interest and discussion from the audience of classroom teachers and administrators. Visual Education needs more meetings of this variety.

Copies of the Proceedings are available at \$1.25 each, from W. A. Wittich, editor, 351 W. Wilson St., Madison 3, Wisconsin.

# Post-War Planning for the Audio-Visual Program in St. Louis

*A great city system's plans for a long-range visual program, carefully planned and adequately financed.*

DOROTHY BLACKWELL

Division of Audio-Visual Education  
Board of Education, St. Louis, Missouri

(Above) This English fisherman and fisherwoman are among the three hundred foreign dolls made by the WPA Visual Aids Project and loaned to schools by the Division of Audio-Visual Education.

(Left) Children, interested in early St. Louis, visit the exhibit of furniture designed many years ago.

FOR each generation there are new frontiers to be explored, new challenges to be faced, new problems to be solved. Public school education stands now on the boundary of a new frontier. The challenge it faces is the responsibility of developing a generation of young people who can think for themselves and who can interpret in terms of a better America the complex changes resulting from this war. It is significant that these changes are revolutionary rather than evolutionary. A whole generation of progress has been telescoped into a few brief years. Education's problem is how to give students the understanding essential for intelligent living in the post-war world.

It is now obvious that traditional educational methods are inadequate for the task ahead. An understanding of the post-war world can not be acquired solely through the memorization of one man's opinion as recorded in a textbook. New teaching materials and new techniques are necessary to give teachers and students alike, the knowledge and training required to achieve the objective of a better America.

Fortunately some of these new teaching materials and techniques are now available through the program of audio-visual education. The motion picture, the radio, and all the other audio-visual teaching aids have proven their effectiveness, both in school classrooms and in the educational programs of the armed services.

They offer a medium through which students may understand the changes brought about by the war and they furnish teachers with new ideas to replace many of their traditional concepts and habits.

Teachers, as well as the students in their classes, will need to become acquainted with scientific discoveries and technological progress. They will need to understand the new manufacturing processes that have come from the laboratories of the world; and how these new processes and products will not only change folkways, but will help solve some of the economic and political problems of the future. Just as James Watt and Thomas Edison did more to influence the life of the average man than did Napoleon, so the discoveries inspired by this war will have a more far-reaching influence on life in the future than the conquests of the battlefields. Discoveries in medicine that will prolong life, developments in the field of electronics, the development of new metals for use in transportation and prefabricated housing, the discovery of new plastics and other synthetic raw materials, and the technological advances in transportation and communication are all potential factors for the creation of a better world in which to live.

In order that teachers may understand scientific and technological discoveries and use them to achieve a richer, fuller and more secure life for all peoples in the

future, they must experiment with new techniques in teaching. Never before has it been as important for educators to use all available teaching materials to keep themselves informed, and to stimulate intelligent discussion among student groups. It is only since the United States entered the war that education has begun to realize and understand its tremendous potential power. To education, and to education alone, is given the opportunity to develop a generation of young people who will be trained to think for themselves; who will be able to face with confidence each problem that arises, knowing that within themselves lies the capacity for its solution.

Never before in the world's history has this capacity for making wise decisions been as vital as it is today and will be in the future. Never before have the world's problems been so complex. The world faces new frontiers in which there are but few landmarks for guidance and no clearly charted maps. In a democracy problems must be solved through the sum total of the cumulative thinking of its members, based upon their individual background of experience. The challenge to develop a generation of young people who can think for themselves is a new frontier for education.

To meet this challenge school systems must take fuller advantage of audio-visual teaching aids. The military educational programs have devised new teaching techniques and materials for use in this field which can be adapted to public school education, and after the war commercial producers will seek peacetime outlets for these new devices and ideas in the public schools. It is wise then, that the school systems begin now to plan long-term programs so that the necessary budgetary provisions may be made to purchase post-war visual materials and modern projection equipment.

The St. Louis Public Schools, which have pioneered in the development of audio-visual education, are now preparing for the future. In the fall of 1942 a Committee on Visual Education was appointed by Philip J. Hickey, Superintendent of Instruction. This committee, composed of classroom teachers and principals, cooperated with the Division of Audio-Visual Education in making an extensive survey of the present visual education program and in developing a long range program for post-war expansion. The survey revealed a pronounced increase in the interest of the teachers in the use of visual materials for classroom instruction, which is significant in view of the fact that the St. Louis Schools have used such materials as a vital part of its teaching program for the last forty years. The committee found that not only is the Division of Audio-Visual Education unable to supply all the materials and teaching aids requested, but that the supply of audio-visual projection equipment is inadequate to meet the increased demand.

Basing its recommendations upon the findings of this study, the Visual Education Committee and the staff of the Division of Audio-Visual Education formulated a four-year plan to cost approximately \$135,000. This plan, if it is carried out, will equip each school building in the city with adequate visual education equipment and provide, through the Division of Audio-Visual Education, an adequate supply of up-to-date motion picture films.

The Visual Education Committee emphasized in its report the importance of expanding the exhibit and loan collections in such classifications as world geography, intercultural relations, aviation, conservation, chemistry and other sciences, nutrition and health, and in materials appropriate for use in primary activities. It was urged that new collections of other visual materials should be purchased, including additional photographs, filmstrips, lantern slides, kodachrome slides, phonograph records, mounted mammals and birds, rocks and minerals, industrial products, historical exhibits and apparatus for scientific experiments.

The effective use of these visual materials requires careful discrimination in their selection by the classroom teacher. She should preview any films she considers using to determine if they will contribute directly to the general purposes of education to which the classroom activities are directed. If the film is worth the time required to show it, usually from twelve to fifteen minutes, then it is worth the time it takes to make sure it achieves its purpose—that is the time required to give the film a chance to stimulate critical thinking, intelligent discussion, additional research, creative writing, and in many cases, a plan of worthwhile action.

The St. Louis Schools recognize that the value of the new teaching materials depends upon improvement in the techniques of using them. Teachers, especially trained in audio-visual education, are assigned to the staff of the Division of Audio-Visual Education to work with in-service and student-teacher groups in the utilization of visual aids. They are not assigned as supervisors, but are available upon request to give individual

Motion pictures are used to provide children with unbiased information needed for clear thinking.

or group instruction in improving the curriculum through correlating visual teaching materials.

Recently the responsibility for the development of radio education in the public schools was assigned to the Division of Audio-Visual Education after the Board of Education's unanimous decision to apply to the Federal Communications Commission for the assignment of a frequency modulation wave length in the high frequency spectrum allotted to education. A Committee on Radio Education, composed of teachers and principals, has been appointed to serve as a policy-making body, similar to the Visual Education Committee. This committee is working with the Division of Audio-Visual Education in the planning and production of educational broadcasts, the development of

radio techniques in high school workshops, and the intelligent utilization of radio programs.

In planning for the future, the Division of Audio-Visual Education and its correlated committees recognize the importance of these two fundamental points:

1. To make the most effective use of all of the audio-visual teaching materials available, and
2. To take advantage of new teaching aids and techniques as they are developed.

Through this program the Division of Audio-Visual Education, under the leadership of Miss Elizabeth Golterman, is seeking to provide some of the educational tools essential to give students a clear understanding of the problems they must face in an ever-changing, dynamic civilization.

## Who Will Make Visual Aids in the Post-War Period?\*

*The ultimate need for "textfilm companies" in production for the visual education field.*

DR. DON C. ROGERS

Assistant Superintendent of Schools, Chicago

A PROMINENT newspaper columnist, literary critic, and author of seven novels, told me over the luncheon table that he had about decided to write an elementary school textbook. He had heard that certain elementary school textbooks, notably reading series, have been used in schools by the millions, in one or two cases more than fifty million. Although a man of prestige, in fact, one of America's "big names" in the literary world, perhaps less than one hundred thousand copies of his seven novels had been sold to the public. Therefore, he was about to invade the school textbook writing field.

Knowing that this newspaperman-novelist possessed a highly individualistic personality, reveled in the unusual, employed a flamboyant vocabulary in his writings, and chafed at conventions, I asked him "if he knew what he was getting into." With genuine surprise he asked me what I meant.

For the next thirty minutes, I laid before him a pattern of elementary school textbook writing procedures, involving such things as (a) sticking objectively to research findings regarding concepts that children use and need rather than items of author-interest, (b) limiting the textbook's vocabulary to words within the first few thousand most frequently used words as reported in Thorndike's Word List or found to be of a certain median grade level in the Buckingham-Dolch composite list, (c) the introduction of only a limited number of new words per page in the lower grades, (d) inclusion of exercises for drill and review,

(e) provision for the periodic use of objective-type tests, and other features which a textbook publisher would require. When I concluded, he commented with finality, "I wouldn't stultify my mind by writing a school textbook."

Once in Hollywood, California, I was cornered by two motion picture directors, both of whom had directed entertainment film "hits" winning nation-wide acclaim. They put me through a sort of voluntary third degree about the feasibility of their access to a wealth of past pictures in the libraries and archives of the motion picture industry, which they felt could be drawn upon and converted by cutting, splicing, inserting, labelling and adapting to educational usage.

I told them about the specialized nature of classroom films and the fact that up to that time no instructional film company had ever been out of the red, and raised so many questions and problems that they must have become discouraged because they have not yet entered the classroom film field.

These two examples are given to illustrate the fact that the production of instructional films is a scientific, psychological, technological, educational and promotional undertaking, involving subject-matter specialists, educational experts, motion picture technicians, and business men. Thus, whoever produces instructional films in the future will have to encompass a co-operative staff of experts in all of these fields.

Who will produce instructional films in the future? The public school teacher, principal or supervisor? The college professor of biology, or physics, or social studies? The makers of projection equipment? The Hollywood-type motion picture industry? The federal government or some of its various branches? Special interest groups? Private firms specializing in classroom films?

\* Address given at the Sixth Midwestern Forum on Visual Teaching Aids, Chicago, July 22.

It is certainly true that an occasional teacher will produce a film as a sort of hobby. But films made by hobby-inspired teachers will scarcely scratch the surface of classroom usage. For one thing, the average cost of an instructional sound-film has been about \$7,500 for a ten-minute reel—perhaps two-thirds that sum for government-made films.

I venture to suggest that films made solely by subject-matter specialists will be too long, too technical, with too insignificant coverage of the whole curricular field, and probably not meeting either classroom or motion picture standards.

Motion picture equipment firms would enter the film-producing field only to provide an outlet for their product. But classroom films are now so widely used that there is no necessity for that reason, and they will have their hands full making a high quality of equipment that will meet the demands of teachers.

It is likely that only the Hollywood-type companies, the government, special interest groups, and private classroom film companies deserve serious discussion.

The Hollywood-type producers have the capital and the motion picture technicians and equipment but I venture to predict that eventually they will tear their hair in despair, trying to conform to classroom standards of usage, particularly authenticity. Furthermore, the type of films they produce will probably tend to give the public the impression that films are "entertainment" for children so that teachers can avoid work. Furthermore, there probably isn't enough profit in classroom films to lure entertainment-type producers into this field—and keep them there.

The United States Office of Education is now engaged in production of educational training films, having produced or in process of producing some 500 titles within the past four years, and circulating some 32,000 prints. However, the U. S. Office of Education got into this field to meet a war-training emergency, and will probably withdraw as soon as the war is over whether it wants to or not! Let me read you the testimony of the Assistant to the Commissioner before the House of Representatives Committee on Appropriations. "When we were faced, in the spring of 1940, with the obvious fact that this country would soon be in all-out preparation for national defense, if not eventual participation in the war, we naturally began to plan in the Office of Education, for utilizing the existing resources of the whole vocational education program throughout the States. Our primary purpose in making these films was to assist absolutely green, inexperienced shop mechanics who were going to be brought into the war-training program by the thousands in the vocational schools to teach these programs. There was no time available to put them through normal teacher-training courses which we usually do in leisurely peace-time pursuits before they go on the job. We had to give them a pattern of what good methods of teaching specific shop skills will do, which they could follow." That this program has been highly successful in serving its intended purpose, everyone—so far as I know—will agree. Whether it will continue after the war is highly debatable.

In the final report of the Committee on Appropriations, the chairman of the committee stated, "It would appear to the committee that this visual aid program has substantially served its purpose in the war effort, and in doing so has opened a field in education that may be more properly and successfully covered by private industry." The appropriation for production of visual aids by the U. S. Office of Education was \$2,000,000 for 1944. After the committee hearings, when the appropriations bill authorizing 1945 appropriations was printed, it included only \$207,312 for visual aids, and I understand in the final act as passed, this sum was later cut to \$175,000 providing only enough to wind up the production of films which have already been started, and further stipulating that U. S. Office of Education films "shall be sold at a price sufficient to pay the whole cost of production".

Thus, whether you and I like it or not, our question concerning who is going to produce classroom films seems to be partly answered. Apparently, they will not be produced by the government. And this applies to C. I. A. A. films for two reasons, first, because this agency was created solely as a war emergency agency—to keep the Germans from winning over South America, and second, because this agency should be included in the special interests group.

Special interests groups desire to use the schools for advertising some product or to indoctrinate children with certain ideas. However, schools cannot afford to permit advertising and indoctrination propaganda with their half-truths, glorifications, and other distortions to enter the classroom via films. If we do, the visual education program will eventually be ruined. Previously, this question came up for discussion at the University of Wisconsin Visual Education Institute. Someone said, "Why not use propaganda films? They are very interesting. And besides, there is propaganda in everyday life, so why not subject the children to it, and get them used to detecting propaganda?"

"Let the user beware" is not an acceptable standard for classroom text films. *Truth* is too vital to teaching to have advertising and indoctrination insinuated into the classroom where barriers of resistance to propaganda are down. At least, in the lower grades where children are immature. In the neighborhood theater, it may be different. Let the children use their propaganda-detecting abilities there. But, in my opinion, school boards, administrators and teachers should no more permit films produced for advertising and indoctrination into their classroom than they would textbooks advertising Lydia Pinkham's Vegetable Compound or indoctrinizing with Anti-Semitism. In the long run, if classroom text films are to develop into universal use and into a fundamental teaching tool, we must discourage their production by special interest groups.

Of all probable producers, the ones most likely to survive and to win and retain the confidence of the teaching profession are the specialized private firms—similar to the textbook publishers—who will produce instructional films for classroom use and devoid of any other purpose.

# Visual Education's Immediate Job

DONALD P. BEAN  
Publisher, Educational Screen

**T**HE emphasis being placed on postwar plans for all phases of American life, including school programs, should not blind anyone to the realities of the military situation and the fact that America still has a war on its hands. Americans cannot overlook that grim truth if those interested in visual education carry out their responsibilities and opportunities in the Sixth War Loan Drive, November 20-December 16.

Up to the present time this is, in many ways, the most critical of all war efforts. The Treasury Department, which discovered the power of the 16mm film in the Fifth War Loan Drive, proposes to mobilize all 16mm projectors for the Sixth War Loan in much the same way that private boats were requisitioned in Britain for service at Dunkirk.

Now that military activities are proceeding satisfactorily, there exists a real threat to the successful prosecution of the war effort in the danger of relaxation of public interest and support of war activities on the home front. The public does not realize how costly such a lull in the vigorous prosecution of the war would be in American lives and money. They must be made aware of the fact that the enemy is still there, and that the war is not yet won. After Germany has been defeated, there is still Japan. And after the fighting ceases, heavy expenditures will still be required to police conquered territories and feed and clothe eleven million men during the orderly process of demobilization and re-absorption into civilian life.

The problem is essentially an educational task, and a difficult one. Presenting the real facts to the entire country, in order to motivate the entire population to "Finish the Job," offers a real challenge to those interested in audio-visual aids. The public is vaguely aware of the role which visual aids have played in the enormous task of training our vast military establishment. We now have an opportunity of proving their potency in reaching the entire country with this important public message. Readers of EDUCATIONAL SCREEN will be interested in this preview of these plans and the important part which they can play in their realization.

Special and exclusive 16mm releases—eleven of them—have been prepared for this program. The films were produced from special Army and Navy combat photography, and specially edited in powerful releases for this specific task. Six of the films were prepared by the Army Pictorial Service, and five by the Navy.

The Army releases are all 2½ minute trailers with the following titles:

- Every 2½ Minutes**—a moving presentation of the inexorable toll of war as epitomized in the death of an American soldier every two and a half minutes.
- Hands**—those in civilian life and those in the armed services, contributing to final victory.
- Silence**—of conquered battlefields and home, as contrasted with the din and realities of war.

**The Line is Busy**—on war messages and telegrams of notification.

**\*Just for Remembrance**—depicting the facilities for returning the souvenirs of American dead to their loved ones.

**\*Justice**—as it is deserved by the Germans and the Japs.

The special Navy releases are longer programs varying from ten to twenty minutes and depicting almost every phase of naval operations in the Pacific where America's heaviest naval operations are yet to come:

**Photography Fights**—the role of photography in aerial combat, 12½ minutes alone; 15 minutes with every 2½ minute Army trailer.

**We Said We'd Come Back**—organization and costs of naval operations with the detailed account of one landing operation. 21 minutes.

**Freedom Comes High**—what the Commander of a Destroyer thinks while sinking a Jap Battleship. 19 minutes.

**It Can't Last**—training for aerial combat and fighter pilot in action. 21 minutes.

**\*The 957th Day**—an unadorned documentary of one day's fighting in the Southwest.

It is unnecessary to coax or coach school people who have had perfect records in making all of their quotas in past War Loans concerning how to proceed in planning their activities. But the War Loan organization hopes that schools will lead all other groups in incorporating these movies into their programs. Some members of the committee in previewing the films suggested the advisability of cautioning school people against using some of the grimmest fighting scenes with primary or elementary school children or mixed school groups, so the films containing most of these shots have been starred in the above lists, and the usual precautions about previewing all films should hold for these programs. Information about securing prints will be found later in this article.

Because of the special urgency of the Sixth War Loan it is hoped that school people will make a special effort to co-operate with their state and local War Loan organizations in loaning sound projectors, providing trained operators, opening assembly halls for war loan meetings, and helping in the publicity about film showings.

The critical character of this phase of the war effort justifies such co-operation. Democracy has a splendid opportunity, following the national election, to demonstrate to the world its unified support of the war effort. Schools not only have their usual interest and role in that process, but in this case have a particularly fine opportunity to demonstrate their special visual education facilities and to prove their real potency.

The Treasury Department has appointed special national and state organizations to facilitate the use of film materials in the Sixth War Loan drive.

\*See caution in the text with reference to school use.

Information about the availability of films in your region should be secured from your State Chairman at the address given below or at the office of the State War Loan organization, with those activities he will be directly connected.

# The Film and International Understanding

DR. JOHN E. DUGAN, Editor  
Haddon Heights, New Jersey

## Film Technique Gives Life and Meaning to Abstract Ideas and Mass Statistics

Fig. 1

Fig. 2

Fig. 3

Fig. 4

Fig. 5

Fig. 6

Fig. 7

Fig. 8

A problem of great concern to all who are interested in using the film for better international understanding is the portrayal of abstract ideas or statistics. Some statistics and ideas are so large or abstract that they cannot be compassed or portrayed by ordinary news or fictional photography. We must deal directly with the idea or the statistics. How can the motion picture contribute here? Can film technique make these abstractions take on greater life and meaning in order to make a contribution to international understanding which no other medium can?

Philip Ragan, a young American who has contributed much original and creative thinking to the visual presentation of ideas and statistics, as well as their use in films, has given a positive answer to this question and has demonstrated his thesis by more than thirty films which he has made for the Canadian Government during the last two years. At present he is working on a similar film about the rehabilitation of returning Canadian soldiers.

Ragan's films are unique in several ways. First of all, they deal exclusively with ideas or statistics which are pictured by animated geometric graphic symbols and are presented through an animated silhouette technique. This silhouette technique is not limited to black and white, but combines shades of gray with them.

Ragan maintains that his technique is different from Disney's, and that Disney makes pictures which imitate reality, while he deals exclusively in symbols. The symbols may move about; some may even walk about, struggle with each other, etc. The symbols consciously are reduced to the most concise design of pictorial elements. A table or a doorway may represent a store or a house. Symbols sit down where no chairs are. Sometimes a film may have no set backgrounds.

On occasion a film may lead the spectator to create a symbol in his own mind. Figures 1-5, taken from a recent Ragan film called *Mutual Aid*, illustrate this point. At first the spectator sees the boat moving in normal silhouette (Fig. 1). Then the angle of view moves up and above the boat (Fig. 2) while the pictorial elements are reduced until only a white silhouette (Fig. 3), symbolic of the boat, remains. Then this silhouette, becoming more angular and taking on a tail like a comet, becomes the spearhead of a line.

(Fig. 4) which moves across a world map, tracing trade routes of mutual interdependence. (Fig. 5)

In another use of the elementary boat symbol in this same film, single boat symbols move across the Pacific and are attacked by Japanese aviation. Figure 6 shows the destruction. Note the four graduations from black to white in the picture. Figure 7 shows the conventionalized symbol of sabotage which strides about creating destruction. In Figure 8 the black Axis symbol struggles with the white Allied symbol.

The movement of the symbols in the films gives them added force and significance. The extreme simplicity of the symbols adds to this effect, since the mind is freed from confusing or distracting details and is free to concentrate upon essential ideas. There is some possibility that Mr. Ragan may endeavor to make some slide-films with symbols. He feels that in these the symbols may have to be somewhat more detailed in order to make up for the lack of motion.

There is another unique feature in the films which we have been discussing—most of them are only 80 seconds in length. They have a sound track, and usually are shown next to the news reel. Thus they do not inconvenience either the theatre owner or the audience. The possibility of having films of this sort exhibited in this way in theatres throughout the world is an intriguing one. Could it not possibly be one of the easiest means of spreading sound principles of international understanding throughout the world?

Are films of this sort and of such short length effective? Do they get across their messages? Can they arouse a response strong enough and lasting enough to produce the results which are desired? One must see one of these films to appreciate the impact achieved by these moving symbols. It is an amazing example of the power of the motion picture when it is properly used.

Although produced for the Canadian Government, these amazing films actually are made in Philadelphia. It is to be hoped that Mr. Ragan's genius with this sort of film may be brought to bear upon some of our own civic problems and problems of international relations and understanding.

## It Can Be Done

(Concluded from page 341)

"just entertained." The conversation went something like this:

"How did you like the film, Jerry?"

"Oh, it was all right."

"Just all right?"

"Well, the picture was sort of interesting, but I don't see why we have to take a test on it—never did before."

"I'm interested in the first part of your statement, Jerry, that the picture was 'sort of interesting.' (The picture referred to was *Simple Machines*.) What do you mean?"

"You could see things real clear, you could see just what was happening."

"You mean, Jerry, that you could see the lever in operation, the pulleys actually doing work, or the inclined plane as it's used in modern machines?"

"Yes, that's what was good—never quite caught on to it before. The picture showed me that. But why did we have to spoil it with a test?"

"Well, Jerry, suppose you think back about how you studied rocks and fossils in science. How did you learn about those things?"

"Oh, we talked about them. Our teacher told us about them, and we read."

"What did you read, Jerry?"

"I read one of those little booklets we just got, and then the chapter in the book, and some things at the library, and—"

"Yes, Jerry, and did you by any chance take any tests on the information you had read over or talked about?"

"Sure, we always do. At the end of every unit we always take a test and those who get it right are O. K., and those who don't—well, they have to do some more work."

"Yes, you read about it, discussed it and took tests on it. Now answer this fairly, Jerry. If you had your choice between learning about simple machines by reading about them, then talking about them, and being tested; or, learning about these same machines by watching the film you just saw, talking about it, and then being tested, which would you prefer?"

"Why, seeing the movie, of course! Oh! . . . I guess I get what you mean."

So Jerry got it, and so increasing numbers of children will "get what I mean." Increasingly, though slowly at first, children begin to see the tremendous advantage of learning by seeing and listening to well-prepared, authentic, pedagogically correct sound films even though testing, which at first seems so foreign to the motion-picture environment, is a part of the process. It must be remembered, however, that even though the educational sound film at first seems to be such an unusual innovation in the classroom situation, yet basic teaching methods still apply and may be used effectively. The preview or overview of the subject to anticipate its showing, the actual showing, discussion, and testing become just as valid a cycle of method for use with the educational sound film as they are with traditional materials.

The battle to overcome our Hollywood heritage will be a long one. Teachers must not become discouraged by initial pupil reaction, but rather they must hold steadfastly to the realization that the educational sound film is an "open sesame" to more complete and sure understandings of processes and social situations which depend upon motion and environmental sound in order to be understood completely. They must plunge doggedly through this ebb tide of interest which typifies many pupils' "first reactions" to text films, secure in the knowledge that slowly but certainly the children will recognize the true educational sound film as an extremely worth-while supplement to a good classroom procedure. Out of it will come the realization that the educational sound film, although it may be a hard taskmaster, can overcome the Hollywood heritage and take its rightful place as a modern tool to learning.

# The Literature in Visual Instruction

## A Monthly Digest

ETTA SCHNEIDER RESS, Editor  
New York University Film Library

### ADMINISTRATION

- **Trends in the Distribution and Use of the 16mm. Sound Film for Educational Purposes**—L. C. Larson—*Proceedings of the National University Extension Association*, 26:21-4 May, 1944.

A report of the activities of film libraries in higher institutions of education and the general use of films by school and adult groups over the nation. The growth in the number of college film libraries is indicated by the fact that in 1935, 26 such institutions existed; and in 1942 there were 96 such film libraries. There was a concurrent growth in the number of sound film projectors, from 458 in the 1936 national survey, to 9,861 in 1940-41. Other estimates show that over 15,000 sound projectors were purchased by schools from 1935-42. As soon as projectors are released again, the numbers will expand. The author predicts that in the first decade after the war there will be over 100,000 sound projectors in the schools—one for every ten teachers.

With respect to college and university film libraries, it is likely that most of the projectors will be in school systems that are too small to own their own extensive collection of films. Yet these circulating libraries do not appear to be meeting the needs of the smaller school systems. Whereas in one state, the college film libraries own 6 to 10 prints of classroom films, large city departments in nine cities of over 50,000 population purchase 35 to 50 prints of each.

After the war, the college film libraries may expect a great increase in the use of films by adult groups as well as by schools. A film library can effectively assemble 2,000 different titles to serve educational needs within the colleges and in schools. The number of prints owned of each title will depend upon the number of users.

Besides sound films, a bureau of audio-visual aids should include the circulation of filmstrips, miniature slides, pictures, recordings, etc. There should be guidance, too, in selection, utilization and production of all types of aids.

- **What the Well-Equipped Audio-Visual Program Should Contain**—Bruce A. Findlay, Supervisor, Audio-Visual Education Section, Los Angeles Schools—*School Executive*, 64:59 September, 1944.

A summary of the various types of projection equipment, and their usefulness in the postwar school, with appropriate illustrations.

### FILM TRENDS

- **Planned Health Film Production**—Dr. Adolf Nichtenhauser, American Film Center—*Journal of Health and Physical Education*, May 1944. (Reprints available from the author.)

This critical analysis of trends in the health film field was presented before a group of outstanding leaders in health education.

A careful study of available health films bears out the experiences of thoughtful health educators in showing that although a number of useful films exist, the material as a whole is insufficient and rather disappointing in quality. The reasons for their poor quality are, briefly: a lack of creative ability in production, a tendency to crowd too much into a short film; an overuse of the sound track and a poor use of the visual part of the motion picture, and the desire on the part of producers to serve all kinds of audiences without adequately helping any of them.

There is a lack of films for the low-income and rural people. There are no films on such important subjects as personal hygiene, sanitation and prevention of diseases, mental and maternal hygiene, etc.

Some planning and coordination of effort would help to bring about increased production of films that are needed. First we must determine what films are to be made, and for which specific groups. Then we need a better presentation of films so that they make best use of the power of visualization. This can be accomplished by a long-term program and a short-term program. For immediate production there is the need for films for uneducated and under-privileged audiences on a variety of topics.

Financing of health films is difficult because there is no assurance that the outlay can be regained from the sale of prints. As the situation now stands, only sponsored production is possible.

A very important lack in the field of health education is for films to help train health workers; to show techniques and methods in actual use; to illustrate administration practices of health departments; and to train volunteers.

- **Science Developments Teachers Should Understand**—Bertha E. Slye—*Virginia Journal of Education*, 38:18 September, 1944.

The great problems which our complex society presents and will present in the future are being and will be helped through the use of appropriate films. Objectives of science education that will thereby be served are: (1) imparting a fundamental knowledge to all people of the physical laws which govern life; (2) developing a constructive attitude of mind; (3) teaching how to adjust to a rapidly changing environment with a minimum of reactionary emotional disturbances; and (4) preparing pupils to look ahead and plan for the future.

After the war we will have to streamline our methods in accordance with those techniques used by the instructors of the armed forces. In these methods are included the use of films, charts, models, exhibits and so on. Industries have also prepared materials on new scientific developments. The new scientific developments now being planned should be explained through films. Among the postwar research activities that could be treated are: new power-driven electrical devices for the home, new radio and electronic methods, improved roads and engines, techniques of aerial photography, health aids through new drugs, smoke-riding devices for cities, new uses of glass, and so on.

Instruction with audio-visual aids, if begun in elementary science, can act as a springboard for continuing research in the science laboratory of the secondary school. Responsibility for putting such instruction to use rests with science teachers as well as with those whose business it is to disperse scientific knowledge to assure that such knowledge is used constructively in the advancement of the race.

### SCHOOL-MADE AIDS

- **Homespun Tools of Learning**—Leland S. March, Westwood High School, N. J.—*School Executive* 63:18 July, 1944; p.28 August, 1944.

This article considers the possibilities of various types of teaching materials other than the motion picture. The picture file can be organized with the help of students. Cartoons are a valuable teaching device, especially those made by the students. The chart, diagram and graph should be promoted in social studies classes, and the help of the art and mathematics teacher should be enlisted to assure accurate and neat teaching materials.

School-made maps may be readily produced. There are those made from a lantern slide projected on to the black-

(Continued on page 354)

The Vernier Scale is practically a complete course in the use of this basic tool. USOE sound film available for rental or sale from Filmosound Library.

*Speedy*

**LEARNING IS VITAL NOW!**

**T**O HELP you *teach more* . . . to help students *learn more—faster*, the U. S. Office of Education has sponsored the production of hundreds of skill-training motion pictures. Carefully planned, minutely detailed films on machine shop practice, shipbuilding, aircraft, optical craftsmanship, welding, electricity, radio, and many others are now ready to help you and your students.

You can rent or buy any of them from the B&H Filmosound Library. To encourage the building of school film libraries, rental charges are rebated if films are bought within 30 days after rental.

With few exceptions, these are *sound* films, giving trainees the dual impact of sight and commentary. You add immeasurably to their

effectiveness when you show them with a B&H Filmosound Projector. Brilliant, rock-steady screen image plus clear, clean sound reproduction at any volume level give Filmosound projected movies a *professional* quality that's unsurpassed.

Complete film protection and other features of Filmosound's famed design simplicity mean freedom from annoying program interruptions.

If your school *has* Filmosound, help keep it in use on vital teaching problems. If you *don't* have a Filmosound Projector, remember that schools giving war instruction are given priority on Filmosound equipment. Coupon will bring information.

**COVARRUBIAS**  
★ MURAL MAPS

Endlessly fascinating . . . scientifically accurate studies of the vital Pacific area in nine brilliant colors. Detailed and decorative visual aids to understanding current world events. Third edition now on press, for delivery in December . . . 10.75 the set (series of six).

**SCHWABACHER-FREY**  
735 MARKET STREET • SAN FRANCISCO

board or a large sheet of paper. A semi-permanent black-board map may be made with the following solution. Mix sugar and cold water; dilute to one part solution and 2 parts water; soak soft chalk in this solution until the bubbles cease rising; dry and use. This medium will not erase but may be washed off. A projected map on plywood is also very effective; especially in jigsaw style to show territorial expansion. Outlines of maps, charts or diagrams may be drawn on linoleum blocks to produce permanent "rubber stamps" for making several copies.

Scale models, preferably those that can be manipulated, may be made by upper grade high school students, as, for example, a canal lock, a guillotine, Fulton's Clermont, etc.

The diorama is judged as one of the most valuable teaching aids. It can be the joint effort of mechanically and artistically skilled students.

For impressive occasions the silhouette dramatization will help to convey information in a dramatic fashion. Details for presenting such performances are given in the article. Akin to this method is the marionette dramatization which needs the help of every department in the school—wood-working, domestic science, art, science, music, English, social studies and mathematics.

The final type of visual device described is the lantern slide of the photographic type and the drawn type, in 35mm or standard size.

- **Slides in Teacher Training**—Arthur M. Seybold, Montclair State Teachers College, N. J.—*Nation's Schools*, 34:54 July, 1944.

At the State Teachers College of Montclair, N. J., college students have been given instruction in making slides, 2x2 film slides, 8mm. and 16mm. silent movies. Thus a record is kept of student work and of school activities. These slides are then used to show prospective students the curriculum of the college. A college collection of art slides has been made by copying art masterpieces on Kodachrome. Various teachers at the college have already produced useful teaching slides with the aid of their students.

#### MAPS, CHARTS, GRAPHS

- **Maps and Charts for the Air Age**—N. L. Engelhardt, Jr., American Airlines—*School Executive*, 64:68 September, 1944.

Some of the aids that will help to develop an air-minded attitude for postwar living are: the air globe, by which air routes and airport centers are shown, with physical and political boundaries eliminated; the project globe constructed by the students; a map projection trainer which is used to teach the concept of projection on to a flat surface from a sphere; pole-centered maps; U. S.-centered maps and others.

- **Visual Aids and Arguing**—Otto Neurath—*The New Era in Home and School* (London), 25: No. 3, p. 51 April, 1944.

A very thorough description of the great vistas that are possible in the use of pictorial statistics charts, or as the

author terms them, "isotypes." These are language pictures in which a conventional image is used as the basis for conveying information. The symbols used are international and will therefore impart information regardless of the verbal language. A few colored isographic charts are used to illustrate the article.

A provocative editorial introduces this article, and was written by the eminent British educator Joseph Lauwers.

#### RELIGIOUS EDUCATION

- **Leaders Learn Visually**—Mary Leigh Palmer—*International Journal of Religious Education* 20:4 July-August, 1944.

The use of motion pictures has had an inspiring effect on many church audiences. Those who have opportunity to plan leadership education experiences should provide an opportunity for showing selected films, color slides and the like. This may be given as part of the general methods course, or as a separate course. There should also be opportunity for seeing new films and slides at institutes and conferences.

#### SOURCES

- **Audio-Visual Business Education**—E. Dana Gibson, New Mexico Highlands University, Las Vegas—*Business Education World*, 25:22-25 September, 1944.

This is the first of a monthly series to help teachers of the various branches of business education in making greater use of audio-visual devices. In this article a good overview is presented of the purposes to be served, the future potentialities, the average cost of each of the types (in tabular form) and some of the chief reference books.

The article then includes a brief but pointed statement about several of the devices, e.g., the school journey to business establishments, the school museum of business materials, films that are particularly suitable and carefully presented, lantern slides and filmstrips, flat pictures, graphics, and auditory materials.

- **Health Education for All Ages**—compiled by Lili Heimers—*New Jersey State Teachers College*, Upper Montclair, N. J. Vol. 2, 36 pp. mimeo. 75c. 1944

This is the second list of teaching aids dealing with health education, prepared by this institution. It lists additional sources for charts, maps, posters, exhibits, films, slides, filmstrips, games, pictures, publications and recordings. The index indicates in detail the many topics for which such supplementary teaching aids are available. The material is grouped under nine major subjects, namely: physiology, alcohol and health; personal health and hygiene; nutrition; mental hygiene; heredity; marriage, family life and sex education; diseases; nursing, safety and first aid; public welfare.

#### PERIODICALS

- **Sight and Sound**—Vol. 13, No. 49 May, 1944.

See especially "Possibilities of the Filmstrip," by M. Clayton, p. 16. The growth in use of the filmstrip as a medium of education is as rapid in England as in the United States.

- **Challenge to American Youth**—*Building America*, vol. 9, No. 8 1944. 30 cents.

Another excellent brochure of a vital problem that is treated in an interesting and significant manner, with the skillful combination of words and photographs. This issue on the problems that challenge American youth, is timely and important for all schools. The challenges that are expressed are: jobs after the war, personal adjustment, world citizenship, American citizenship and education.

Fortified with the facts presented in this issue, American youth can begin its study and plan its course for the kind of world they want for themselves and their neighbors.

# HIGH STAKES IN THE EAST

**A FACT FILM OF THE DUTCH EAST INDIES**  
*Beautifully Filmed . . . Clearly Presented*

In a world more interdependent than ever, Western eyes now turn East in search of the day when freedom shall prevail and the conqueror driven from the riches he has coveted. In the days to come, no island — no continent, can long remain isolated from a world insistent on peace, security and freedom . . .

THIS FILM introduces to us the largest island-group in the world . . . *The Netherlands East Indies* . . . situated between Asia and Australia, the Pacific and Indian Oceans. Strange, distant places and names once familiar only in romance, more familiar now as battle-grounds, take on new meaning as we learn something of the geography, the people, the culture, the history, the economy and world importance of these fascinating islands.

**PEOPLE — AREA — ECONOMY**

70,000,000 Indonesians . . . living on Java, Borneo, Celebes, Bali, Sumatra and other islands covering an area 1000 miles wider than the U.S. . . . industries, important to the inhabitants, vital to large sectors of the world outside; rice cultivation; sisal and rope, sugar and salt; coffee and tea; oil and rubber; tin and tobacco; arts and crafts. Maps and commentary set the people and their life in relation to the rest of the world.

**Suggested Uses**

HIGH STAKES IN THE EAST is a colorful film useful for all motion picture programs. It is of special interest to stimulate classroom study of the Dutch East Indies, social studies, history and geography. It is also a visual aid for school and adult education groups concerned with the background of the war against Japan and international relations.

## EFLA Service for School-Produced Films

SCHOOL film producers will welcome the plan for distribution of educationally produced films now being developed by the Educational Film Library Association, Inc.

L. C. Larson, chairman of the Board of Directors of the Association, reports on the proposed features of the plan which will provide a clearing house service for 16mm sound and silent films produced by member institutions and agencies.

Purposes of the service will be "To acquaint all members of the association with the film production activities of member state departments of health and education, county and city schools, colleges and universities, museums and libraries; to serve a clearing house function in the sale of prints of certain educationally produced films to educational institutions and agencies and commercial film libraries; to maintain a center for the exchange of information among members in the production of films."

Reviewing services for films produced by members will be provided. In the distribution of films, the As-

sociation will accept "only those films which meet reasonable standards with respect to technical quality, organization and treatment of content, and educational usability. . . . The crucial test of the worth of a film is the number of directors of film libraries who, following the previewing of the film with local committees, will find the film useful enough to warrant the purchase of one or more prints. . . ."

As soon as five member institutions or agencies have indicated their intentions of purchasing a print and a majority of the previewers of the film approve its distribution, the association may undertake to distribute the motion picture. "Following acceptance of the film by the Association, promotional materials shall be sent to all educational and commercial film libraries, and to a selected list of potential users who might be interested in borrowing or renting the film from their local library." A list of proposed service charges on the sale of prints has been compiled.

For future information regarding this new service, write to L. C. Larson, Educational Film Library Association, Inc., 45 Rockefeller Plaza, New York 20, N. Y.

## Motion Picture Contest for Amateurs

The American Humane Association is sponsoring a contest for the best amateur-produced motion picture on the subject of animals. The film may deal with any type of animal life—pets, domestic animals, and wild life, including birds—and treat any aspect of animal life that meets with the purpose of the contest, which is to create a friendly, kindly interest in animals. It should have educational value, though it need not be primarily an educational or teaching film.

All films submitted must be on original 16mm stock and not less than 200 feet nor more than 800 feet in length. They may be in black and white or kodachrome, silent or sound. The contest closes on March 31, 1945.

Anyone interested in participating may obtain a free copy of the contest rules by writing to The American Humane Association, 135 Washington Avenue, Albany 6, New York.

American Education Week, November 5-11, should be an excellent time for the showing of new public relations films and the repeat performance of older ones. If your school does not have a film of its own to show this year, make plans for even a short one to be completed soon.

*Reports on new school-made films are always welcomed by this department. Send a note to the editor about your film today.*

*Performance  
is Everything!*

That explains the preference of school authorities for Holmes Sound-on-Film Projectors, which are so enduring and reproduce picture and sound so faithfully and clearly. Plan now for post-war replacements with Holmes machines.

# FOR SALE Without Priorities

(By Special Permission of W.P.B.)

A LIMITED QUANTITY OF

## CHALLENGER SCREENS

Sizes: 40" x 40" and 52" x 72"

**"America's Most Popular Portable"**

The Da-Lite Challenger, has won wide acceptance among schools because of its greater convenience and durability. Only the Challenger can be raised in height without separate adjustments of the fabric or the case. Twelve sizes from 30" x 40" to 70" x 94" inclusive.

A special ruling of the War Production Board permits us to offer a limited quantity of the above sizes of Challenger Screens for sale without priorities. Orders will be filled in the sequence in which they are received and until the supply of screens is exhausted. These sizes are in addition to the 30" x 40" Challenger which was recently made available without priorities in limited quantities.

Ask your visual education dealer to forward your order immediately.

You can buy with confidence from the dealer who displays this sign

### QUESTION BOX ON FILM PRODUCTION

**QUESTION:** The University is contemplating the making of a 16mm. motion picture film, on Kodachrome, of general campus activities. Could you give me the possible cost, say per hundred feet or perhaps per thousand feet for the placing of sound on this film when it is finished? Also, could you tell me where the film might be sent for the addition of a sound track?

**ANSWER:** In the December 1943 issue of EDUCATIONAL SCREEN, Mr. Eldridge described in detail the cost of producing a 390 ft. reel of black and white film which he had made earlier in 1942. The silent negative amounted to \$120.54. The addition of sound plus the cost of a combined print amounted to \$121.95, bringing the total cost to \$242.49.

To get the latest quotations on 1000 feet of Kodachrome, I consulted several studios in New York and in Chicago. The most reasonable reply contained the following figures:

Scoring	\$150.00
Sound film negative	20.00
Developing sound negative	20.00
Positive track print needed for printing with Kodachrome	43.00
Combined Kodachrome print	130.00
Reel and can	8.00
<b>Total</b>	<b>\$371.00</b>
Narrator	150.00
Opening and closing music	25.00
Complete musical background	200.00
<b>Grand total</b>	<b>\$746.00</b>

You will notice that if you supply your own narrator, and do not wish to include background music the cost of a sound print of your film can be reduced by about 50%. I have received estimates from other studios whose price range varies up to \$2000.00, with an allowance of \$500.00 off, if your own commentator is willing to spend at least three days in their studio supplying the narrative.

Before you proceed with your film production, may I remind you of a few points to be taken into consideration?

1. Be sure to shoot your silent film at 24 frames per second. This will bring about perfect synchronization with the speed of the sound projector.

2. After you have received your processed Kodachromes make sure you get a scratch print of each roll. Editing is a more detailed job than actual film shooting.

3. With your scratch print completely edited, you are now ready for the commentary. Measure each scene for foot lengths. If you are going to use straight commentary you must allow four words per foot, providing, of course that the language is non-technical. A pause, now and then, may be very refreshing. I have noticed in many "educational" documentaries, the tendency to keep up the barrage of verbiage, when the audience might have better been left alone to enjoy some excellent photography. From my own experience as a listener, I prefer more than one narrator in any film, no matter how professional the speaker may be.

I have an idea that you would want to include some of the college songs and music in your sound track. This will involve sending members of the orchestra and band to the recording studio. This may be less expensive, in the long run, since there is a royalty charge for copyrighted music.

4. Each of the studios requires a priority rating to obtain the Kodachrome print. The Eastman Kodak Company is operating almost to capacity on high priority work for the Armed Services, and consequently will be unable to make more than one print of your film unless a preference rating is obtained.

D.S.

# Teacher Committee Evaluation of New Films

L. C. LARSON, Editor  
Ass't Prof., School of Education  
Consultant in Audio-Visual Aids  
Indiana University, Bloomington

Assisted by CAROLYN GUSS  
and ELIZABETH MEANS  
Extension Division  
Indiana University, Bloomington

## A Man and His Job

(Brandon Films, Inc., 1600 Broadway, New York City)  
18 minutes, 16mm. sound. Purchase price \$50. Produced by  
The National Film Board of Canada. Discussion guide  
will be available.

The film begins with a shot of Joe Martin as he leaves the factory at the end of the week. Following his usual custom, he opens his pay envelope as he saunters down the street. Even though he had been dreading for some months an expected lay-off, nevertheless he is somewhat stunned by the dismissal slip which he finds with his check.

The paper that he buys for want-ads coincidentally announces a riot among the unemployed. This indicates that Martin's predicament is not unique. His wife receives the catastrophic news with subjection and a fatalistic attitude.

Following scenes show Martin trying employment office after employment office. Always the answer is the same, "Sorry, no work." In desperation he makes a few final stabs to secure a job. As he follows up interviews with telephone calls, there swims before his eyes a series of faces of employment agents shouting, "No, no, no!"

The film next shifts to 1940 during which year the Canadian Parliament passed the unemployment insurance plan,

This monthly page of reviews is conducted for the benefit of educational film producers and users alike. The comments and criticisms of both are cordially invited.

Producers wishing to have new films reviewed on this page should write L. C. Larson, Indiana University, Bloomington, Indiana, giving details as to length, content, date on which the film was issued, basis of availability, prices, producer and distributor. They will be informed of the first open date when the Teacher Committee will review the films. The only cost to producers for the service is the cost of transporting the prints to and from Bloomington. *This Cost Must Be Borne By The Producers.*

whereby all employed men are required to put part of every pay check into a national reservoir for their mutual protection when they are out of work. By this time Joe Martin was working on a job in a defense plant and necessarily subscribing to the national unemployment plan. When because of plant renovation, he and his partner are laid off, they are instructed to report to the employment office, a clearing house for the working power of all Canada. Here the two men are interviewed, and after the authorities have gathered data covering their physical qualifications and backgrounds of training, they check their files for jobs. Bill is placed in a new job hundreds of miles away, but Joe Martin is asked to file for a check to cover the time he is out of work.

Panoramic views show the processing of unemployment insurance books and the manner in which social security accounts are kept. In the meanwhile, the commentator explains that every applicant must show that he is not working and that he is willing to work at a job of the same nature and comparable pay.

The following sequence shows the operation of the Court of Referees, which considers disputes of employees. Mac's case serves as a basis for the dramatization of the steps involved in gaining a hearing. He lost his temper and because of calling his boss names lost his job. His case is considered by the local court, and since he is not satisfied with the decision, it is referred to the umpire, who is the last court of appeal and who renders the final decision.

The last sequence shows Joe Martin returning to his job after the eight week lay-off, and from his machine he looks up and says, "Lay-offs are not so tough now." Final scenes show fine national housing projects and happy workers, and the commentator concludes with the thought that there is a national security when all men look out for the welfare of each other.

### Committee Appraisal:

Shows the progress Canada is making in solving the problem of unemployment and insecurity through a national unemployment insurance plan. An excellent example of the use of the film medium in documenting the many facets of a socio-economic problem of national concern. This film should be widely used by teachers on the secondary and college levels; by industrial, labor, and farm groups; and other organizations who will be concerned with ways and means of avoiding mass unemployment upon the termination of this war.

## FILMS for CLASSROOM USE

One of the largest, exclusively-educational film libraries in the country, we specialize in 16mm Sound instructional films and offer a wide range of subject matter in many fields of instruction, including:

BIOLOGY	GUIDANCE	TEACHER-TRAINING
CHEMISTRY	HISTORY	FOREIGN LANGUAGES
GEOGRAPHY	PHYSICS	French, German
GEOLOGY	PSYCHOLOGY	Spanish

You can also depend upon our Library always to supply you with the latest, important 16mm releases of the Canadian Film Board, the British Ministry of Information, and the U. S. Government.

## Home Electrical Appliances

(Encyclopedia Britannica Films, Inc., 1841 Broadway, New York City) 11 minutes 16mm. sound. Sale price \$50 less 10% educational discount. Discussion guide available.

The film gives the scientific principles involved in the operation of common electrical appliances used in many American homes.

The first part of the film takes up the essential facts concerning the general wiring of a home. The lead-in wires connect to a main switch, next to a meter where all used electrical energy is measured, then to the fuse box from which branch lines lead to all parts of the house. Each one of these branches—consisting of two wires—ends in a service outlet. An appliance, such as an electric light-bulb, completes the circuit.

The second sequence deals with heating appliances and thermostats. Metals which have high resistance to the conduction of electrical currents generate heat. The electric iron is explained in detail as the most commonly used appliance in this class. The construction of the heating element, the use of mica as an insulator, the role of the bi-metal strip (having different coefficients of expansion) in the making and breaking of the electrical circuit as a heat regulating device, and the repair of a damaged iron are the items covered.

The third phase of the film deals with lighting of homes—by incandescent or fluorescent lamps. In the former, the amount of light depends upon the material used in the resistance wire and its size and length. In the fluorescent lamp more of the energy is converted into light by means of ultra-violet radiation of the mercury molecules. The function of the lamp switch, the glow bulb, the opening and closing of the circuits by a bimetal strip, and the mercury vapor molecules are demonstrated by animated drawings. At the close of this sequence the commentator explains that the glass tube is coated with a fluorescent substance

that absorbs the ultra-violet rays and emits a longer radiation than is visible to the eye.

Many home electrical appliances—washing machines, electric ironers, vacuum sweepers, clocks, and fans—use electrically driven motors. The sweeper is used to illustrate this group. The fan which draws the dirt into the cleaner bag is connected to the motor a revolving part of which, the armature, contacts the electric circuit by means of graphite rods or brushes. The easy replacement of these rods when they become worn is demonstrated.

The last sequence deals with the principle of electrical refrigeration. Most refrigerators depend upon a motor which drives a compressor pump. This motor-driven compressor pump draws the refrigerant gas from the evaporator and forces it into the condenser where it is condensed into a liquid. When this liquid escapes into the evaporator through a minute orifice, it expands into gaseous form,

## TWO MEN WANTED!

Man with proven background of experience in distributing motion pictures to all types of non-theatrical audiences.

Man with demonstrated ability to sell special-purpose motion pictures and prepare own presentation.

Both are excellent opportunities with exciting post-war future.

# NEW BRITISH FILMS 16 mm Sound

**COASTAL COMMAND . . . . . 60 minutes**

The hunting down and destruction of a German raider in a fight comparable to the sinking of the Bismarck. Released theatrically by R.K.O. Made with the cooperation of the British Admiralty and Air Ministry.

**MERCHANT SEAMEN . . . . . 11 minutes**

A merchant ship is sunk by torpedoes. An eager youngster, rescued from the wreck, takes a gunnery course and at last gets his chance of sinking a U-Boat. Already known as a classic of the sea in England, and now available in 16 mm for the first time in the U. S. A.

**PARTNERS IN PRODUCTION. . 28 minutes**

*(Made in Britain by the National Film Board of Canada)*

Using a problem of readjustment at a north country coal mine as an example, this film outlines the story of the Joint Production Committees in Britain. An authentic picture of Labor and Management in collaboration, and a striking picture of democracy at work.

**EDUCATION**

**A START IN LIFE. . . . . 22 minutes**

What is being done in Britain to ensure that every child receives the proper care from birth, the benefit of a full education, and a healthy and happy preparation for life beyond the school gates.

**LESSONS FROM THE AIR. . . . . 14 minutes**

Shows the planning and execution of the educational programs which are radioed every day to schools all over Britain by the British Broadcasting Corporation.

**BRITISH COMMONWEALTH SERIES**

**SOUTH AFRICA . . . . . 14 minutes**

**NEW ZEALAND. . . . . 15 minutes**

The first two in a series describing the resources, production, peoples and ways of life to be found in the British Commonwealth of Nations.

**WAR SPECIALS**

**D-DAY . . . . . 10 minutes**

**CHERBOURG . . . . . 11 minutes**

**NAPLES IS A BATTLEFIELD. . . . . 11 minutes**

**LIBERATION OF ROME. . . . . 18 minutes**

**New catalog now available on request**

**BRITISH INFORMATION SERVICES**

**An Agency of the British Government**

1336 New York Avenue, N.W., Washington 5, D. C.  
1236 Canal Building, New Orleans 12, La.

OR ANY BRITISH CONSULATE

thus using heat which is withdrawn from the freezing compartment. The latter is placed in the upper portion of the box and hence by convection currents, the whole box is cooled. Condenser, compressor, their connecting pipes, the movements of the refrigerant, and convection currents of air are shown by animated drawing.

**Committee Appraisal:**

An informational film on electricity treating home electrical circuits and wiring, home heating appliances, lighting, motor-driven appliances, and electrical refrigeration. Animation is used to demonstrate principles and illustrate points more effectively than could be done by either lectures or laboratory demonstrations. Highly recommended for use in courses in general science, home economics, and physics on the secondary and college levels. Even though presented in somewhat technical manner, the film, with supplementation on the part of the teacher could be used on the junior high school level.

**The Negro Soldier**

(Office of War Information, Washington, D. C.) 45 minutes 16mm. sound, Produced by War Department. Apply to distributor for terms governing purchase and rental sources.

A pictorial account of the negroes' contribution to the development of the United States from the time of the War for Independence through World War II. A view of a large negro congregation gathered in a beautiful church for the regular Sunday morning service begins the film. A solemn atmosphere pervades as the negro choir with a decorated soldier as soloist opens the worship. The minister then announces, as he glances over the congregation and sees several soldiers and a very charming Wac, that he has decided to depart from his prepared subject and to re-vamp his sermon to meet the occasion.

He begins by stating that recently at a USO center he was given a ticket to see Joe Louis fight. Scenes which show Joe Louis in the arena are followed by scenes of Joe Louis on the battlefield, and the commentator states that Joe Louis is now in a fight for our way of life.

The minister reads excerpts from Hitler's Mein Kampf, which indicate that the Nazis were training disciples to conquer the world by any means and to exterminate anyone who was opposed to the German Empire.

As the minister chronicles contributions that individual negroes have made to American development, the film shows views of Crispus Attucks, the first to fall in the Boston Massacre; Peter Salem at Bunker Hill; white men and negroes working together after 1776 to build a nation; Lincoln delivering his Emancipation Proclamation; the Reconstruction Period following the Civil War; the Cuban War; and the negro division in the World War I. Also shown are the memorials to Samuel Washington and other honored negro casualties of World War I at Arlington and a similar monument in France recently destroyed by the Nazis.

The minister continues by saying that these stone monuments which negroes have won may be destroyed, but their contributions to medicine, science, literature, education, and the arts will stand forever. Glimpses of Howard, Hampton, Prairie View, and Tuskegee—their institutions of higher education—are shown. Likewise are shown views from the Olympics, in which negroes representing America win over representatives of other nations.

As the minister is mentioning the various divisions of the American Army, a silver-haired negro mother arises and reminds the minister of the infantry of which her son, Robert Brunson, is a member. As she reads his last letter, the film depicts the various stages in the training of an American soldier—his leaving home, being received at an Induction Center, being addressed by the chaplain and the provost marshal, taking physical tests, learning to make a bed, practicing shooting, and relaxing at the USO. The letter closes with Bob's promise that he will soon be wearing his officer's uniform.

After the benediction invoking the aid of God, the congregation joins the choir in singing "Onward Christian Soldiers"

# New Brilliance Depth and Color To Your Projected Pictures

When they are projected on Radiant Hy-Flect Glass Beaded Screens instead of old, faded models and makeshifts.

Thousands of tiny glass optical beads firmly imbedded in the snow white plastic surface of the improved Radiant Screens make the startling difference. These beads *reflect* light instead of absorbing it. The results—black and white motion pictures, slides and slide films show up vividly and clearly with sufficient contrast. Colors take on new depth and brilliance. Student attention and interest is more effectively maintained. Visual aids become more efficient when used with these perfected Radiant Screens.

### Radiant Portable Models Offer You:

In addition to the Hy-Flect Glass Beaded Screen Surface—you will find many innovations, special conveniences and unique advantages in Radiant Screens. These include:

- 1. Automatic Clutch.** A positive device that permits instant raising and lowering of screen housing without the necessity of manipulating screws and bolts. So simple and easy to operate a child can use it.
- 2. Quick Tripod Release.** Tripod legs may be opened or closed quickly. They

support the screen in *any* position for wide or narrow spread without set screws or plungers.

- 3. Auto-Lock.** (Pat. applied for.) Just touch convenient button for raising or lowering center extension rod and screen instantly.

- 4. Convertible from Square to Oblong—**for movies, stills or slides, Radiant square sized screens are convertible to oblong by merely raising screen to indicated position.

The Radiant Screen here illustrated is Model DS—a portable Metal Tripod Screen—sturdy but light, compact, easily set-up, and is quickly adjustable. Available in sizes from 30" x 40" to 52" x 72".

The Radiant line of screens—especially designed for schools and institutions—also includes a complete range of wall, wall and ceiling, and table screens from 22" x 30" to 20 feet by 20 feet and larger.

while scenes show seas of faces of Allied soldiers who will win the war and the peace.

### Committee Appraisal:

The film treats in a positive and sensitive fashion the significant contributions of the Negro to the development of the United States. Certainly it will increase on the part of the audience their admiration and respect for the negro who, in spite of handicaps imposed upon him, continues to distinguish himself by his achievements. Highly recommended as an outstanding film for use by school and adult groups studying and discussing problems of intercultural relationships.

### Youth In Crisis

(March of Time, 369 Lexington Avenue, New York City) 22 minutes, 16mm, sound. Purchase price \$40. Apply to producer for rental sources.

Shows some of the startling temptations which beset today's wartime youth and depicts work being done by intelligent communities in handling this perplexing problem.

The film opens with numerous shots of physical examinations of draftees during which the commentator tells of the large number of rejections—twenty five per cent of which are due to mental and nervous instability. A psychiatrist, Dr. Lawson G. Lowery, states that most of these young men can be fitted into industry and consequently will make a proper adjustment to life situations. However, he is deeply concerned about the effects of the war on adolescent youth.

The next sequence dealing with young children shows boys playing war, a child listening to a horrifying war radio broadcast, and lastly the terrifying effect of the air raid alarm on a sleeping child. During this time, the commentary relates that as long as children know proper security, the effect of violence and sudden death is harmless.

Next are shown conditions that are disastrous to the

youth of today—race riots, "door-key kid" coming home to a disheveled house, boys smoking marihuana cigarettes, children playing with fire, squalid trailer camps with their lack of playground facilities, high school youth buying obscene literature, the upper-teen youth with too much money aping adults by drinking and indulging in riotous night-life, "victory girls" who have no "no" in their vocabulary, and the resentment of these young people toward parental discipline. The police records, highlighted by the press, show that since 1943 the previous ten-year downward trend in juvenile delinquency has been sharply reversed.

It is pointed out that the prevention of such problems lies largely in right home life, where the child has a feeling of being loved and where he shares the responsibilities and good times. Communities by having day nurseries, schools open for evening use, YMCA, and physical fitness programs are helping those children who lack proper home background.

Wholesome guidance is given delinquents by a court in which the judge, after assuring a young girl that his sole aim is to help her, says children are not bad because they have gotten into trouble. He says that youth given a part in the "all-out" war effort—selling bonds, collecting salvage, having victory gardens, organizing 4-H clubs, and dry night-clubs will prevent most of the shocking delinquencies.

### Committee Appraisal:

A dramatic treatment of the problem of wartime juvenile delinquency and the role of the family and society in solving this problem. The vivid and realistic portrayal of delinquent activities of youth high-light the problem in a convincing fashion. Teachers on the secondary and college levels, P. T. A. organizations, and other civic groups will find the film excellent for presenting the problem and suggesting some of the solutions. Could also be used in such classes as social studies, home economics, and sociology to solicit youth's discussion of the problem and their contributions to the solution.

## Staff Changes in University of Wisconsin Bureau of Visual Instruction

Looking toward expected changes and expansion in visual education to follow the war, the Extension Division of the University of Wisconsin has announced a readjustment of its educational film and photographic facilities, operated by its Bureau of Visual Instruction.

Freeman H. Brown, the director of the University Photographic Laboratory, a division of the Bureau, who has also had charge of the educational film department, will assume full time direction of the photographic laboratory, where work on important technical problems and expansion in many directions are contemplated. The laboratory serves all departments in the University. Mr. Brown also will continue his direction of the technical phases of work in the bureau of visual instruction.

Walter A. Wittich, who has been director of visual instruction in the Madison school system, has been appointed acting director of the bureau of visual instruction, effective October 1, 1944, and will have charge of the educational film department.

"Partly as a result of the steady development of new educational techniques," Dr. L. H. Adolfson, extension director, reported, "and partly as a direct result of the experience of the armed forces in their multifarious training programs, visual instruction is apparently due for unusual developments in the post-war years ahead. It is hoped that, with separate departments each with a full time director, and working in close cooperation, the widest latitude for experimentation and development will be afforded in the field of visual instruction."

Plans for expanding the photographic laboratory's technical work include the perfection of sound film recording, micro-filming, and experimental work in related fields.

In the educational film sphere, the efforts are expected to be focused on the selection and evaluation of films for teaching purposes and on their wider use by schools throughout the state. It is planned to integrate the work of the bureau more closely with the University's school of education, where Mr. Wittich will have teaching assignments in subjects relating to films as aids to teaching processes, and also to increase the classroom use of visual aid materials throughout the University.

## M. R. Klein Leaves Cleveland Schools

M. R. Klein, formerly Director of Visual Education of the Cleveland Public Schools, has recently been appointed Director of Visual Education at the Dayton Acme Company, 930 York Street, Cincinnati, Ohio. This manufacturer will enter the postwar period with visual aids. Mr. Klein will be in charge of sales and promotion of its products for the audio-visual field, serving schools, industry, churches, clubs and individuals in the amateur and professional ranks.

# Notes

## March of Time Films for Schools

Specially edited 16mm versions of eight regular March of Time film releases, known as the Forum Edition, are to be made available—one each month—for use by schools and clubs, beginning October 1. The contents of the original film will be rearranged to include material of permanent value, deleting those sequences which are of immediate news interest only, adding others to make the Forum films more useful for study and discussion, and writing a new commentary to bring out particularly the economic and social values of the subject.

The entire series of films, which run twelve to fifteen minutes each, may be rented at a subscription price of \$20.00, or individual films may be selected at an individual rental of \$3.00 each. Discussion outlines accompany the films. The series for the 1944-45 school year deals with Brazil, Portugal, Texas, Canada, India, Airways of the Future, New England, South Africa.

## More USOE Visual Training Aids

Fundamental farm skills, nursing procedures and engineering subjects are being taught with the assistance of motion pictures and filmstrips produced by the U. S. Office of Education, Federal Security Agency, to speed up the war training of workers in these fields.

To offset the shortage of new farm machinery, a series of six films has been produced on the maintenance and repair of farm equipment—mowers, grain drills, cultivators, tractors, and two-bottom tractor plows. The films show farmers how to keep old equipment in good working order and what to do if a piece of machinery breaks down. Each subject is covered thoroughly so that farmers who see a picture know what to do and in what order, what tools to use, and what safety precautions to follow. Besides the six pictures on the maintenance of farm equipment, there are films on "Horseshoeing," "Sheep Shearing," "Community Canning," and "Repainting Frame Buildings". The Farm Work visual units were produced in Missouri under the supervision of Ford Lemler, J. S. McIntosh, and Edward Christiansen of the Division of Visual Aids and Glen C. Cook of the Food Production War Training Program of the U. S. Office of Education.

Titles of some of the films in the group on Nursing are: "Care of the New Born Baby", "Feeding the Patient," "Taking Blood Pressure," and "Temperature, Pulse and Respiration." Engineering films include "Slide Rule," "X-Ray Inspection," "Measurement with Light Waves," and "The Electron."

These pictures, like the more than 100 other Office of Education training films, were planned by technical experts and specialists in visual education. Subjects were chosen in terms of today's training needs, and all were approved by the War Manpower Commission.

As these visual units are completed, they are re-

**Gardner Hart Appointed Director of Commission on Motion Pictures**

Gardner Hart, recently released from the U. S. Navy, has succeeded Dr. Mark A. May, now in England on a government mission, as director of the Commission on Motion Pictures in Education. Mr. Hart's headquarters are at Yale University, Department of Education, where a permanent staff of research consultants will function in carrying out the purposes of the MPPDA grant to the Commission. The Commission's program of recommendations for the guidance of educational leaders for the coming year is now being formulated.

**Film Producers Association Formed**

Educational Film Producers Association, New York City, a new production group in the educational film field, made its bow last month with the filing of incorporation papers at Albany. Purposes of the Association as announced are: "To advance the study, understanding, and appreciation of educational, instructional, and informative motion pictures: to foster, encourage, and promote the production and distribution of such motion pictures and to provide a clearing house for information pertaining to educational films."

Officers of Educational Film Producers Association are: President, Fletcher Smith, Fletcher Smith Studios; Vice President, Max Lasky, Films of Industry; Secretary, John Flory, Grant, Flory and Williams, producers; Treasurer, Elda Hartley, Hartley Productions; and Chairman of the Executive Committee, Emerson Yorke, Emerson Yorke Studio.

In addition to the foregoing officers, charter members include Julien Bryan, Julien Bryan Pictures; Herbert Kerkow, Kerkow Productions, Inc.; John McCrory, Knowledge Builders; Clarence Schmidt, Spot Film Productions, Inc.; Ralph Schoolman, scenarist; C. O. Welch, Welch Productions; and Elizabeth Harding, Educational Film Library Association.

**In-Service Course Emphasizes Delinquency Problem**

A course on "Motion Pictures and the Program for Personality Adjustment" is being offered to New York City teachers by Mrs. Esther L. Berg, under the auspices of Rita Hochheimer, Assistant Director of Visual Education, New York City schools, and the Junior High School division.

The course will include the use of films from the *Human Relations* series, edited by Dr. Alice V. Keliher, for improving inter-racial relationships and social adjustments; proper utilization of all types of audio-visual aids in teaching procedures, and the study of current films for motion picture appreciation and of radio programs for out-of-school listening.

### Book Week Celebration

For twenty-six years Children's Book Week has been an annual November observance, the dates this year being November 12-18. This is a cooperative effort to promote reading and better books in the home. It has been a primary factor in a rapid growth in children's libraries, encouraging authors and artists, and extending the wide popular sale of the best books for children, new and old.

Libraries, schools and bookstores all over the United States will have special exhibits of books. The central theme selected is "United Through Books." Special Book Week programs will be given on the radio and by various women's organizations. The children, in the schools and the libraries, put on plays which usually are dramatizations of popular books; have puppet shows, dances, music, quizz contests, give reviews of books, make their own book posters and exhibits, form reading clubs, and in general make the week a grand celebration with everybody doing something centering around children's books.

A large full color poster is prepared each year and sold to libraries, teachers and booksellers at a nominal sum, \$.25 to cover costs. Manuals are made ready each year for distribution free of charge to some 30,000 teachers, librarians and booksellers. The Manual gives a short history of Book Week, suggestions of activities which can be planned and lists posters, bookmarks, and other aids for promotion of children's books.

Similar activities are being planned in England, Brazil, the U. S. S. R., Nicaragua, Mexico and Bombay.

### American Education Week

"Education for New Tasks" is the theme for the 24th annual observance of American Education Week, November 5-11, 1944. This theme will be highly appropriate at a time when the end of the war in Europe is imminent if it has not already come.

We spare no expense to get people ready to win the war. Why? Because we know that only a trained people can win. Public sentiment would not tolerate for a moment a proposal to send any American boy into battle without the best of training under the best instructions and with the best equipment that money can buy.

Now is the time when we must plan an educational program which will help the youth of today to win the peace. American Education Week comes at an opportune time to stress the crucial role the schools can play in the nation's future. Plan now for an effective observance. Write the National Educational Association, 1201 Sixteenth Street, N. W., Washington 6, D. C., for a list of helpful materials such as poster, manual, leaflets, sticker, plays, radio scripts, and other materials.

### Motion Picture Courses

Professional training for men and women in all branches of documentary film work, to prepare for the postwar demand for documentary films, is given at the Institute of Film Techniques at the Evening Session of the College of the City of New York which commenced its fourth season on September 28th.

The curriculum lists five courses: (1) *Fundamentals*

# Threefold

## EDUCATIONAL SERVICE

offered by  
**ENCYCLOPAEDIA  
BRITANNICA FILMS**

### Authenticity of Subject Matter Assured

Because the authenticity of all material presented is safeguarded by the collaboration of outstanding authorities and subject-matter specialists, Encyclopaedia Britannica Films offer educators the most authentic classroom film library ever produced to meet the demands of the school curriculum.

### Correct Film Selection Assured

To help you properly select Encyclopaedia Britannica Films for your school system, we prepare, without obligation, an Integration Study after duly analyzing your school syllabi or courses of instruction. With this individualized Integration Study before you, you can systematically build an Encyclopaedia Britannica Film Library to fit your courses of instruction.

### Proper Film Utilization Assured

When Encyclopaedia Britannica Films are introduced into your school system, our Film Utilization Service at once plays an important role. Highly trained teachers, selected for their comprehension of modern instructional problems, explain the techniques of using Encyclopaedia Britannica Films as an instrument for dynamic classroom instruction.

of Film Production, an elementary course open to beginners which demonstrates every step in picture-making, from the idea stage to final distribution of the completed film. (2) *The Experimental Studio*, a workshop course open to selected students from the elementary course and to those with previous professional experience will be given by Hans Richter, Acting Director of the Institute of Film Techniques, who will supervise the making of a complete 35 mm. documentary.

Other courses are: (3) *Advanced Workshop*, which will offer professional training in narration writing, sound recording and cutting; (4) *Motion Picture Photography*; and (5) *Motion Picture Editing*.

Guest lecturers will include John Grierson, Film Commissioner of Canada, Robert J. Flaherty, Joris Ivens, John Ferno, Alice V. Keliher, Irving Lerner, and others to be announced.

## First International Church Workshop in Visual Education

ABOUT two hundred leaders from twenty-six states, Washington, D. C., and Canada attended the first International Workshop in Visual Education for church workers, held at North Park College in Chicago, August 28 to September 2. Dr. Mary Leigh Palmer of the International Council of Religious Education was initiator and Director of the Workshop, which was carried out in cooperation with the Committee on Visual Education of the Council. The persons attending were for the most part representatives of their denominations or of their state or city councils of churches. Twenty-six different denominations were represented.

A major purpose of the Visual Education Department of The International Council of Religious Education is to integrate visual method and materials into the total program of the Council and the churches in its constituency. The Workshop should make a major contribution to this end since the following groups of church workers were represented: National and Regional Directors of Visual Education, Leaders of Children's Work, Youth Work, Adult Work, Leadership Education, Vocational Schools, and Weekday Schools. There were, also, Church School Administrators, Pastors, District Superintendents, Directors of Religious Education as well as Editors, Missionary Educators, Professors, Publishers, State and Regional Directors and Laymen.

The utmost cooperation was extended by projector manufacturers, film and slide companies and other visual agencies in providing visual materials and equipment, and specialized leadership for certain phases of the program.

At the opening session, Dr. Stephen Corey, of the University of Chicago and of Encyclopaedia Britannica presented the use of visual aids in the schools. Dr. Ray G. Ross, General Secretary of the International Council of Religious Education, addressed the group giving the history of the International Council's interest in visual education, its program, the place of visual aids in the work of the church and the future of this work. The first evening's session was devoted to a symposium and forum. Representatives from the

projector companies cooperated with the staff of the Workshop in presenting and discussing equipment for projecting visual materials.

Each day's program included a morning round table of one and one-half hours dealing with such topics as the selection and use of motion pictures, the selection and use of slides and prints, when and how to use visual method, some principles, and program building. The group then divided into four functional work groups. The group on Visual Method with Children worked out policies to be followed in using visual materials with children, evaluated films for children and pointed out some needs in this field. Under the leadership of Rev. William S. Hockman, the group on the local church further sub-divided into groups for pastors, directors of religious education and for chairmen of educational or visual education committees. They gave major attention to basic principles when using visual materials. National denominational directors of visual education worked on problems of the total program which a denomination might carry forward. The regional directors worked on plans for leadership education, financing a program and just what a state or city program might include. The denominational book store representatives worked on special problems in the distribution of films.

In the afternoons a variety of activities was possible so that choice was necessary. Opportunity was given to learn the operation of various types of equipment. Miss Caroline Cole directed the projection groups and served as film librarian, while Mrs. August Beck instructed groups in making dioramas, home-made glass slides, mounted pictures, simulated stained glass windows and other simple non-projected visual aids.

Rev. William L. Rogers, Secretary of the Religious Film Association, and Mr. William F. Kruse of Bell & Howell cooperated in directing the groups concerned with script writing for motion pictures and actual motion picture camera work. Dr. Arthur O. Rinden supervised the group interested in making 2x2 kodachrome slides. He also gave attention to home-made equipment.

In the evenings films and slides were reviewed. They were organized about the "Life and Teachings of Jesus", "Ethical and Nature Films", "Missionary and World Problems" and "Films and Slides for Leadership Education". One person was in charge of the reviews each evening. Members of the group were also responsible for "visual vespers."

The fellowship of the group was all that could be anticipated. Enthusiasm was high and the group felt its historical significance as the *First International Workshop in Visual Education for church workers*. The Director of the Workshop reviewed the purposes for which it had been organized and it was felt that the objectives were achieved in a splendid way. The group demanded regional workshops just as soon as feasible and was unanimous in desiring a similar International Workshop next year. The Visual Education Committee of the International Council met on the Saturday following the Workshop and set the date for the next one as August 20 through August 25. A report of this 1944 Workshop will be released by March 1, 1945.

# Current Film News

## News Parade of the Year—1944

**M**ANY school libraries of films will be able to add an important review of history this month when the eighth annual *News Parade of the Year—1944* is released by Castle Films, Inc., 30 Rockefeller Plaza, New York City.

This reel is an exciting review of all the year's outstanding and historic events. Never in the long record of world crises and staggering climaxes since 1937 has Castle had so much spectacular motion picture material from which to select in editing this film. Among the stirring episodes visualized are: the crushing final blows the Allies are giving Hitler's forces in every European theater of war from the Gothic Line in northern Italy to the shattered Siegfried Line on German soil. The sweep of the victorious Russian armies into the crumbling Fortress Europe on the east is pictured. And historic films from the Pacific including the latest events on the ever-shortening road to Tokyo tell the story of American victories in this momentous year.

Highlights of the reel include amazing shots of Britain's battle against Hitler's last and most deadly weapon, the robot bomb. Sensational accuracy in big gun marksmanship explodes several flying bombs in mid-air, as the camera records these hard-to-get shots filmed dangerously close to the explosions.

The reel also covers important home events of 1944 including the tense wartime Presidential campaign.

*News Parade of the Year—1944* is offered in two 8mm. editions and three 16 mm. editions, including a sound deluxe version narrated by a recognized commentator with background of stirring music and effects.

■ **DeVRY FILMS**, 1111 Armitage Avenue, Chicago, is distributing the Illinois Education Association's film:

**Backing Up the Guns**—one-reel, 16 mm. sound. The picture shows how our schools are promoting the physical fitness of pupils and how teachers guard and develop the ideals upon which Democracy was founded. It closes with a strong appeal to the taxpayers to vote to equip their schools better for the tremendous post-war educational task.

The film has the endorsement of the American Association of School Administrators and the United States Office of Education.

■ **THE NATIONAL FILM BOARD OF CANADA**, 84 E. Randolph St., Chicago, announces the following three-reel 16mm. sound film, available for purchase through Brandon Films, Inc., 1600 Broadway, New York City, and for loan on a service charge basis through the facilities of the British Information Services, 30 Rockefeller Plaza, New York City:

**Partners in Production**—the story of Labor-Management committees in wartime Britain. Workers' representatives of Labor-Management Committees are democratically elected. A typical election in a factory is shown, and the machinery by which Labor-Management Committees can refer questions to the Regional Boards of the Ministry of Production, which in turn can take them to the National Production Advisory Council. The film briefly reviews some of the different kinds of Labor-Management Committees in existence, and the methods they use to ensure that workers and management really become partners in production.

Four other National Film Board productions are being handled on an exclusive sales basis through Pictorial Films, Inc., 1270 Sixth Avenue, New York City. They are: *The Main Dish*, *Vitamin Wise*, *What Makes Us Grow*, *Vitamins A, B<sub>1</sub>, C, D*.

**Vitamins A, B<sub>1</sub>, C, and D** consists of four 4-minute sound films. Each film deals with one of the main vitamin groups and gives a graphic survey of the importance for both mothers and children of eating well-balanced meals in which these vitamin categories are contained in sufficient quantity to ensure a healthy new generation and to counteract wartime food limitations.

**What Makes Us Grow?**—one reel—is made for a youthful audience, explaining the necessity for proper food. Experiments with rats show the fatal results of vitamin deficiencies, and children are advised to eat more eggs, fresh vegetables and fruit.

■ **OFFICE OF WAR INFORMATION**, Bureau of Motion Pictures, Washington, D. C., has acquired prints of a film on nursing through the courtesy of the U. S. Cadet Nurses' Corps. Title of the one-reel subject is:

**Reward Unlimited**—a dramatic presentation stressing the great need and exciting work of Cadet Nurses. This film was produced to inspire young women interested in nursing to take part in this vital war service.

■ **SHARP & DOHME, INC.**, Philadelphia, Pa., has produced a timely, dramatic sound film about immunization against children's diseases, entitled:

**A Passport to Health** which aims to serve as a vital eye-opener to parents and the public. Attacking the belief that it is better for children to "catch a disease and get it over with", the film points out the high death rate and dangerous after-effects of many childhood illnesses. Whooping cough, for example, is revealed to have a death rate nearly 20 times as high as diphtheria among infants under one year. And scarlet fever—while not always present in this country in its most fatal form—may leave children with bad hearing, sinus or mastoid trouble, kidney inflammation and other harmful complications.

The film voices the important facts about immunization by weaving them into the human, interesting story of one typical American family, acted by professionals from stage, screen and radio. It presents a moving illustration of what happens to a child who hasn't been protected. Effect of immunization in lowering the incidence of childhood diseases, the picture comments, is shown by the fact that diphtheria morbidity has been cut in half in the last five years. Immunization is regarded as especially important in preventing wartime epidemics.

From "News Parade of the Year"

■ **BELL & HOWELL COMPANY**, 1801 Larchmont Ave., Chicago, offer two new one-reel nature study subjects for rental or purchase, dealing with:

**The Life of the Ant**—full life-cycle from egg to maturity shown in microscopic photography. Building and defense of homes, foraging, care of young and many other characteristics of ants are portrayed.

**A Fish Is Born**—released by Commonwealth Pictures Corporation. This

subject shows modern hatchery practice and the biological reproduction of perch and pike. Microscopic cinematography presents the complete embryo development.

■ **BUREAU OF MINES EXPERIMENT STATION**, 4800 Forbes St., Pittsburgh, Pa., has produced two 16mm sound motion pictures, in cooperation with two large industrial firms, dealing with:

**Synthetic Rubber** (28 min.)—in which is traced the history of the development of the first rubber-like material in 1892 to present-day production methods in synthetic rubber plants. Processes involved in the transition of chemicals to rubber, is described step-by-step. Other possible sources of rubber, such as milkweed, the guayule plant, and Russian dandelion, are discussed. The picture also describes the action of self-sealing gasoline tanks which were made possible by synthetic rubber.

**Magnesium—Metal from the Sea** (23 min.)—which describes how this essential material is created from common sea water and from salt brines. The story is unfolded both by animation and by views of magnesium-production plants and equipment. Various uses of magnesium are portrayed.

**Airplanes—Their Metals, Fuels and Lubricants** (30 min.)—revealing the romance and skill employed in the manufacture and maintenance of commercial aircraft. Industrial scenes show the production of aluminum, magnesium, alloy steels, copper, gasoline and lubricants. Every operation involved in the upkeep of transport planes is described.

■ **BRITISH INFORMATION SERVICES**, 30 Rockefeller Plaza, New York, report several new war specials, among them:

**Coastal Command**—a 6-reel film picturing the activities of this branch of the Royal Air Force which guards convoys at sea from submarine and air attack.

**Merchant Seaman**—the story of a youngster who takes a gunnery course after his rescue from torpedoed merchant ship, and at last gets his chance of sinking a submarine.

**Naples Is a Battlefield**—how the Allies brought new life to the starving people of the shattered city.

**Common Cause**—pointing out the common outlook and purpose behind the surface differences of national character of the Allies.

■ **THE NATIONAL SOCIETY FOR THE PREVENTION OF BLINDNESS**, 1790 Broadway, New York, has a new film to contribute to the field of health education, titled:

**Eyes for Tomorrow**—2 reels, 16mm and 35mm sound—stressing good general health as a prerequisite for good eyesight. It also deals with the importance of prenatal care, the conservation of vision among school children, use of sight-saving classes for children with seriously defective vision, necessity for regular eye examinations, methods of treating glaucoma and trachoma, and the eye hazards of industry. Alois Havrilla is the commentator for the picture.

A slightly altered version, with Spanish and Portuguese sound tracks, will be released throughout Latin America by the Office of the Coordinator of Inter-American Affairs.

■ **ENCYCLOPAEDIA BRITANNICA FILMS INC.**, 1841 Broadway, New York, have released a new Erpi classroom film on:

**Central America** (Caribbean Region II)—produced in collaboration with L. S. Rowe and William Manger of the Pan American Union. The film presents authentic documentary material concerning the geography and climate of Central America and the story of its peoples and their present-day activities. An animation sequence orients Central America as the western part of the Caribbean Region, and sketches the political history from the time of Columbus to the present. Photographic sequences depict the types of people and economic activities of the region, including agriculture, manufacturing, commerce and transportation.

■ **NEW ZEALAND LEGATION**, 19 Observatory Circle, N. W., Washington, D. C., has just completed production on an educational film dramatizing New Zealand's mountain coal miners, entitled:

**Coal From New Zealand's Alps**—1 reel, 16mm, and 35mm. sound. Opening with a sweeping panorama of the snow-capped Southern Alps of New Zealand, the picture presents the story

of the sturdy men who have pioneered the rugged slopes to mine coal, giving a graphic portrayal of mining operations. The family and social life of the miners is also shown.

The film is available for single showings on a free loan basis. Requests should be addressed to the Film Officer.

■ **PICTORIAL FILMS, INC.**, R.K.O. Building, New York, announces two more releases in the RKO series, *This Is America*, namely:

**Age of Flight**—a review of aviation's progress from the Wright Brothers motor in a box car to flying fortresses and Skorsky's Helicopter.

**Children of Mars**—a film on juvenile delinquency showing what happens to the youngster, three to fourteen without parental guidance, and how social institutions are grappling with this serious wartime problem. Some sound remedies are offered for communities trying to solve this vital social problem.

■ **SWANK MOTION PICTURES**, 614 N. Skinker Blvd., St. Louis, Missouri, in their capacity as official film distributors for the Army and Navy, is booking the new Army release:

**The Hidden Army**—a motion picture that brings home to America's women war workers the official story of their record in the nation's war effort in the beginning and now.

## Reagan Visual Education Co. Changes Hands

Announcement is made of the purchase by Miss Hazel Calhoun from Mr. C. R. Reagan of the Reagan Visual Education Company, Atlanta, Georgia. Miss Calhoun has been actively associated with Mr. Reagan for more than ten years, the last seven of which she has served in the capacity of Manager of the Atlanta company.

Operating under a new trade name—**CALHOUN COMPANY**, Visual Education Service—the policies of operations will continue the same.

Mr. Reagan, who is serving for the duration as Head of the Non-Theatrical Division, Bureau of Motion Pictures, Office of War Information, Washington, will return to Texas after the war to be associated with his visual Education organizations serving the Southwest.

**War Films for War Use 1944-45**—Bureau of Motion Pictures, Office of War Information, Washington, D. C.

This latest release from the OWI Bureau of Motion Pictures lists 79 non-theatrical films available from 270 film library distributors in 48 states. The booklet describes these war information films and lists the names of all distributors cooperating with OWI to provide nation-wide distribution.

These 16mm films inform the American people of the status and progress of the war, on the fighting fronts and the home front.

# AMONG THE PRODUCERS

## Jam Handy Offers New Slidefilm Series

A new series of discussional type slide films, *Instructional Program of Safe Practices*, is announced by The Jam Handy Organization, 2900 East Grand Boulevard, Detroit, Michigan. There are twenty-two subjects in this kit-set, with a total of 1,128 individual pictures, special photographs, drawings, diagrams and pictorial exhibits.

Fourteen subjects aid the instructor in teaching the use of wood working tools and machinery, by describing the various types of each, names and functions of parts, and safe practices for use. These subjects are as follows: "Hand Tools, Hammers, Saws;" "Planes, Bits, Knives, Chisels, Screwdrivers, Files;" "Tool Grinder;" "Drill Presses;" "Jig Saw;" "Band Saw;" "Disk Sander;" "Belt Sander;" "Lathe, Parts, Spindle Turning;" "Lathe, Faceplate Turning, and Other Operations;" "Planer;" "Jointer;" "Circular Saw, Pars, Installing a Blade;" "Circular Saw, Setting Up, Operating."

The other eight subjects in this

Frames from The Jam Handy filmstrip series on Safe Practices

series cover safety and first aid practices in the workshop, as indicated by their titles: "Play Safe and Work Safely;" "Maintaining a Safe Shop;" "Safety Inspection;" "Training for Emergencies;" "Treatment for Bleeding, Shock, Preventing Infection;" "Aid for Injuries;" "Eye Protection."

Another series of seventeen slidefilms on the magneto consisting of 1,028 pictures have been produced by Jam Handy, for the Scintilla Magneto Division, Bendix Aviation Corporation, Sidney, New York. The purpose of these films is to help speed up training in the installation, maintenance and repair of four general types of the Company's aircraft magnetos. The program is to be augmented with sound motion pictures.

So successful have these visuals proved to be as supplementary aids to basic and shop instruction in the Division's own Service School that arrangements have been made to permit the use of the films by instructors in any aviation service school interested. Safety practice is woven through the subject matter contained in the slidefilms. New students are first shown the Jam Handy slidefilm series on *Basic Electricity* because it has been found that this prepares them for a better understanding of the magneto.

## Fairchild's New X-Ray Camera

An entirely new type X-ray camera, incorporating many unusual features, has been announced by the Fairchild Camera & Instrument Corporation, 475 Tenth Avenue, New York. It was shown for the first time at a combined annual meeting of the Radiological Society of North America and the American Roentgen Ray Society, in Chicago September 24-29. Fairchild has designed and is now producing this photo-fluorographic camera for installation in X-ray equipment of several manufacturers, to provide record negatives of images appearing on the fluoroscopic screen. It is expected that the camera will be marketed on a world-wide basis.

Important features of this fully-automatic camera are that it takes images 2½ inches wide by 2½ or 3 inches, dependent upon the type of equipment in which it is installed, on 70mm. roll film; it has an exceptionally fast lens, f/1.5, especially built for Fairchild by the Bausch & Lomb and Eastman optical works; there is a removable film magazine; a pressure plate of the type used in some of the Fairchild aerial cameras holds the film flat in the focal plane during exposure; and, a film feed signal informs the user the camera is in operation, and provides for stopping the camera in case the film is not moving. There is no shutter; the expos-

The Fairchild X-Ray Camera

ure is made for the length of time the X-ray is turned on.

Prior to the introduction of this Fairchild model, X-ray cameras on the market generally were of the 35mm. roll film type or the 4" x 5" cut film variety. Advantages cited for this, the first 70mm. X-ray camera, are said to be many. For example, recognized medical authorities have stated that in viewing 35mm. pictures through magnifiers, trained readers checking for tuberculosis miss as many as 10 per cent of the positive cases; that inexperienced readers have missed up to 50 per cent of the positives. In the Fairchild 70 mm. camera it is expected that in the majority of cases the negatives can be read accurately without benefit of magnification.

Great saving in time and costs is also claimed for the Fairchild unit. As many as 400 negatives can be had from one standard 100-foot roll of film; an extra operator, necessary in taking photos with the 4" x 5", is eliminated; one person can do the quantity viewing of the 70mm. negatives on their roll, and film costs are greatly reduced.

The new Fairchild camera comes at a time when the U. S. Public Health Service is preparing for the biggest offensive yet undertaken against tuberculosis. The biggest weapon in this fight will be the mobile X-ray machine.

## Bausch & Lomb Magazine Wins Award

The National Council of Industrial Editors Associations has notified Bausch & Lomb Optical Co. of Rochester, New York, that its magazine *Educational Focus* has been chosen for second award in the Third Annual Wartime Conference publication contest.

Over 1500 publications were entered and but 58 received mention, so the winning of second place was considered exceptionally good. The *Educational Focus* is sent to schools, colleges and other institutions interested in the sciences. Started in June 1929, the publication has been published regularly ever since. Albert H. Blum is the present editor.

**A Community Tour of Latin America via Films**

Traditional sound moving pictures of Latin America were utilized in an unusual manner this year by Whitman College of Walla Walla, Wash., in a series of programs designed to bring the residents of the district a clear and coordinated impression of their neighbors south of the Rio Grande. The programs took the form of a "tour" of Latin America, in which the recognized educational force of the motion pictures was supplemented by brief lectures on the historical, economic and political backgrounds of the countries involved and by music of those same nations.

The "tour" was made possible by a grant from the Office of the Coordinator of Inter-American Affairs, and represented the first attempt at building better understanding between the Americas through this particular medium. It was the brain-child of President Winslow S. Anderson of Whitman College, evolved several years ago and first presented to the CIAA last year.

In assembling the tour an attempt was made to give the illusion of travel by air, first to the West Indies, then to the West coast of South America, across the Andes, and then up the East coast of the continent to Central America, Mexico, and back to Florida.

The tour consisted of seven weekly programs. Each program opened with music of the countries to be visited, followed by a short background talk by a member of the College faculty. The film program itself lasted about one hour, but on every occasion an additional half hour of films was shown and virtually the entire audience remained for the extra program.

Responsible for much of the public interest in the program was the manner of announcement, which consisted of printed folders describing the tour accompanied by personal letters of invitation from Dr. Anderson, sent to more than 750 residents of Walla Walla. Recipients were invited to make reservations at the college, and to each applicant was issued a round-trip ticket similar to those used by railway and tour companies, with sections to be detached at each program. The series was not purely an invitational one, since tickets were given to anyone applying, but this type of presentation made for interest which was sustained throughout the seven weeks of the series.

Approximately 1,100 tickets were issued for the tour, both to students and townspeople, and the auditorium was crowded for each program. At the opening programs so many persons came that two complete showings were necessary.

Musical programs were furnished by students at the Whitman Conservatory of Music, and represented considerable research into the subject of the national music of the various countries.

Films were secured from many sources.

So successful were the programs that a number of requests were received from other schools for information concerning the tour, and widespread newspaper publicity was given. Among the requests was one from the United States military academy at West Point, which indicated an intention of using similar methods in the instruction of cadets.

**Valuable Literature**

**THE AUDIO-VISUAL HANDBOOK (4th Edition)**  
By Ellsworth C. Dent

Presents in convenient form, practical information for those interested in applying visual and audio-visual aids to instruction. The six chapters include discussions on "The Status of Visual Instruction," "Types of Visual Aids and Their Use," "Types of Audio-Visual Aids to Instruction," "Types of Sound Aids for Schools," "Organizing the Audio-Visual Service," "Source List of Materials and Equipment."  
212 pp. Illus. Cloth. Price \$1.75

**VISUALIZING THE CURRICULUM**  
By C. F. Hoban, C. F. Hoban, Jr., and S. B. Zisman.

Presents in theory and in practice the basic methodology of visual instruction in relation to classroom procedure. Provides an abundance of technical guidance in the form of illustrative drawings of photographs, reports of school journeys, suggestions for mounting materials, for making slides, film strips, etc. It incorporates up-to-date material, provides a fine balance in the treatment of various teaching aids, evaluates various types of aids, and defines the functions and values of each in the learning process.  
320 pp. Cloth. Illus. Price \$3.25.

**PICTURE VALUES IN EDUCATION**  
By Joseph J. Weber, Ph. D.

Presents in unusually interesting form the results of the extended investigations on the teaching values of the lantern slide and stereograph. 156 pp. Cloth. Illus. Price \$1.00

**AN ALTERNATIVE FOR REVOLUTION AND WAR**  
By Albert E. Osborne.

A stimulating, wide-range view of the higher potentialities of visual instruction in promoting world harmony by a "more humanity-centered education." A pertinent reply to H. G. Wells's dictum that the "future is a race between education and catastrophe."  
124 pp. Cloth. Price \$1.25.

**EVALUATION OF STILL PICTURES FOR INSTRUCTIONAL USE.** By Lelia Trolinger

A full presentation of the latest piece of research on determination of teaching values of pictures. Development of the Score Card and elaborate experiment in use of same. Full documentation, tabulation of results, and appendices. The latest, most complete and scholarly investigation of a problem in the visual teaching field that has long needed such a solution.  
48 pp. Paper. Illus. Price 50c.

**THE USE OF VISUAL AIDS IN TEACHING**  
By Ella Callista Clark, Ph. D.

Brief, clear, concise, authoritative. An attractively printed manual of procedure for all visual aids in teaching, with stimulating suggestions for the inexperienced teachers as well as for the veteran.  
24 pp. Paper. Illus. Price 25c.

**HOW TO MAKE HAND-MADE LANTERN SLIDES**  
By G. E. Hamilton 24 pp. Paper. Price 10c.

**THE STEREOGRAPH and LANTERN SLIDE IN EDUCATION.** By G. E. Hamilton.

The most comprehensive discussion yet published.  
47 pp. Paper. Price 15c.

**ONE-STRING FIDDLE**. Paul Wing with gay musical accompaniment. 3 ten-inch Bluebird Records, \$1.05.

**BERTRAM AND THE BABY DINOSAUR**. Amusing story by Paul Wing. 3 ten-inch Bluebird Records, \$1.05.

THE WORLD'S GREATEST ARTISTS ARE ON

Scene from *The Melody Master*\*, in which the glorious melodies of Franz Schubert take on new meaning against a background of the composer's life.  
 \*Released theatrically by United Artists as "New Wine."

# Now! Masters of Music Can Appear in YOUR School

**N**OW your students can see as well as hear great composers, instrumentalists, and vocalists. Shostakovich, Iturbi, Brailovsky, and other great masters of music will perform in your school, at any time your schedule demands.

The scores of splendid 16mm. sound films available from the Bell & Howell Filmosound Library give the music instructor this ideal means to inspire and to show fine techniques. And to teachers of almost any other subject, Filmosound Library offers a wealth of helpful films.

A Filmosound Projector will reproduce these films at their best. Our war-accelerated research in Opti-onics—optics, electronics, and mechanics—is resulting in Filmosounds even better than before. Better in true-to-life sound; in clearer, sharper pictures; in cooler, more quiet operation; in simplified controls.

\* \* \*

For information on films or on Filmosounds, send us the coupon. Bell & Howell Company, Chicago; New York; Hollywood; Washington, D. C.; London. *Established 1907.*

### How to Get a FILMOSOUND

The Army and Navy require most of the Filmosounds we can build. But some are available for other WPB rated orders. Schools can get priority ratings now. The sooner your order and priority reach us, the sooner you'll get your Filmosound. So don't delay!

DEVRY Model 16-1966 Portable 16 mm. Sound-on-Film Projector

**IMMEDIATELY AVAILABLE**

DeVRY TRIPLE-PURPOSE SLIDE-FILM PROJECTOR for 2" x 2" paper or glass slides; single-frame slidefilm; and double-frame slidefilm.

DeVRY PROJECTION SCREENS in models from 30" x 40" to 20' x 20'. Glass-beaded.

FILMSETS 200-ft. 16mm. Silent Motion Picture Films, presenting Economic (Food, Shelter, Clothing), and Regional (Place) Geography for Intermediate Elementary Grades.

DeVRY FILM LIBRARY of selected 16mm. Sound and Silent Classroom Films. These films are for rent or sale.

DeVRY KODACHROME COLOR SLIDES and DISNEY CARTOON SLIDES. Write for colorful, descriptive folders.

You who want to be among the first to get the best—place your order RIGHT NOW for this superb, precision DEVRY 16mm. Motion Picture Sound Projector . . . an electronic device of the highest quality and the finest possible engineering design and craftsmanship.

**DOUBLE VALUE!** Your new DEVRY permits you to utilize Amplifier and Speaker as a Public Address System. Amplifier has input jacks for both microphone and phonograph. Use it for dramatic classes, athletic events, meetings, assemblies . . . add to this the fact that you can show both sound and silent films on this DEVRY projector, and you have a *triple value!*

Your new DEVRY was designed and built by those same skilled craftsmen who produced the famed DEVRY line of 35mm. motion picture sound equipment used in better theatres everywhere—the equipment that has made such an enviable record with the Armed forces . . . for the production of which DEVRY alone in the motion picture industry has received its third consecutive Army-Navy "E" Award for production excellence.

Get brilliantly clear, flickerless pictures, and rich, lifelike, unforced sound. Standardize on the motion picture equipment that is so simple, so durable, and so trouble-free, that an alert 12-year-old student can set it up, thread it, and operate it effectively.

Write for colorful literature—FREE—no obligation to purchase. DEVRY CORPORATION, 1111 Armitage Avenue, Chicago 14, Illinois.

1. **EASY TO CARRY.** Compact, conveniently balanced twin "suitcase" carrying cases. Projector in one case; amplifier and speaker in the other. Separate amplifier and speaker unit provides Public Address Facilities.
2. **SIMPLIFIED THREADING.** As easy to thread as a silent projector. Takes but a minute.
3. **ONE-POINT LUBRICATION.** All high speed parts oiled from one point at top of case. Other oil points plainly marked.
4. **CONVENIENT TILTING.** Finger-tip control. Proper projection level quickly and easily attained.
5. **HEAVY-DUTY MOTOR.** Powered for highly efficient and dependable operation, and is governor-controlled.
6. **THEATER-QUALITY SOUND.** Crisp, natural speech and smooth musical reproduction. Frequency range up to 9000 cycles.
7. **LONG TROUBLE-FREE USE.** Exclusive engineering refinements, manufacturing excellence and durable combat-tested materials make this possible.
8. **TWO-SPEED OPERATION.** 24 frames per second for sound films; 16 frames for silent films.

FOR 31 YEARS AN OUTSTANDING NAME IN THE FIELD OF VISUAL EDUCATION

DeVRY is the Only Manufacturer of Motion Picture Sound Equipment to have Received the Army-Navy Excellence Award Three Consecutive Times.

DEVRY CORPORATION, 1111 Armitage Ave. Chicago 14, Illinois

# Have You Asked for Your Copy?

THE 20th EDITION

## "1000 and ONE"

1944-45

The **Blue Book of Non-Theatrical Films**, EDUCATIONAL SCREEN's annual Directory, was originally announced for production on October 15. Increased editorial work, necessitated by the large numbers of new war films, and wartime paper and printing difficulties have resulted in a three weeks delay.

The published price of the 1944-45 edition of "1000 and One" is

**\$1.00 per copy**

This Standard Reference Tool lists more than six thousand answers to that perennial and puzzling question, "Where will I find a film on this subject?" Classified in five Indexes, under 176 descriptive headings, and indicating producers, main sources, size and length of film

"1000 and One" will be more than ever *The Indispensable Tool* for all teachers, administrators, supervisors, directors of visual education, program chairmen, and producers and distributors of non-theatrical films.

### **Free Introductory Offer**

ONE FREE COPY of "1000 and One" will be mailed to all regular subscribers of EDUCATIONAL SCREEN whose requests for such copies are received before November 30. This will include subscribers who have already sent in advance orders at the originally announced advance price to EDUCATIONAL SCREEN's subscribers, and all money sent in with such orders will be returned.

WE URGE EVERY SUBSCRIBER TO TAKE ADVANTAGE OF THIS FREE OFFER. WE CALL IT AN INTRODUCTORY OFFER because we want you to INTRODUCE "1000 and One" to your colleagues.

### **Don't Be Disappointed**

This Introductory Offer Expires November 30  
and is available to new and old subscribers to

# Before you select your *post-war* Sound Projectors...

## Consider These Facts:

1. An efficient 16 mm. sound-on-film projector will be the heart of your post-war visual aid program. Such a machine is a precision instrument that must possess ruggedness. It must be easy to operate. It must be soundly designed. It must be able to deliver effective tone quality and clear illumination continuously under amateur operation.
2. It requires years of service under actual operating conditions to develop a sound projector to meet these stiff requirements.
3. Ampro 16 mm. sound projectors served thousands of schools and universities for many years before the war.
4. During the war—Ampro projectors were tested and approved as equipment for the U. S. armed forces on fighting fronts the world over.
5. This vast background of experience is your assurance that Ampro projectors can best meet the needs of your school program.

To keep in touch with newest developments in motion picture projection, write today for latest information on Ampro 8 mm. silent and 16 mm. silent and sound projectors.

 8272691

**The KEYSTONE OVERHEAD PROJECTOR and the KEYSTONE FLASHMETER**

**T**HE Overhead projector equipped with a short-focus lens gives a large, clear projection at a short distance.

The Overhead projector with open slide table enables the operator to see, at all times, the number or anything else the subject should see on the screen.

The open slide table of the Overhead projector provides a very flexible means of using acuity charts in slide form and unlimited types of training slides, such as color charts, Polaroid slides, etc., either with or without the

Flashmeter. An adapter for 2" slides will be provided.

The Flashmeter is equipped with an Ilex shutter specially designed for the purpose with iris diaphragm, and speeds from time exposure to one second and up to one one-hundredth of a second.

Forced air conditioning makes it possible to use a 500-watt or a 1000-watt lamp with consequent highly illuminated projection and all parts of the instrument cool.

# Motion Pictures that Bring Your School Great Music by Great Artists

## The MELODY MASTER

The imperishable music of Frantz Schubert is woven throughout this delightful film based on the life of this great Austrian composer. Among the many compositions finely played and sung are "March Militaire", "Serenade", "Die Forelle", the "Unfinished Symphony" and the "Ave Maria". Alan Curtis and Hona Massey head the fine cast.

## MOZART

A notable screen biography of Mozart which is a fitting tribute to this great musical genius. Many of his works are performed by the London Philharmonic Orchestra, directed by Sir Thomas Beecham.

## PAGLIACCI

The story of Leoncavallo's tragic opera is entertainingly unfolded, with excerpts therefrom sung by the renowned tenor, Richard Tauber. Final reels are in color.

## MOONLIGHT SONATA

Pleasing story telling of a broken romance which was restored through memories evoked by hearing a Paderewski concert. This great master of the piano is seen and heard in compositions by Beethoven, Chopin, Liszt, and his own "Minuet in G".

## APRIL ROMANCE

Another version of the pathetically unsuccessful love story of Franz Schubert, charmingly told, and serving as background for his great melodies, which are beautifully sung by Richard Tauber. Jane Baxter is the heroine.

## FIRST FILM CONCERT

A series of short subjects blended together to offer musically appreciative audiences renditions by famous artists of the piano, cello, violin and voice, including Alfred Cortot, Piatigorsky, Brailowsky, Jacques Thibaud and Elizabeth Schumann.

## HEART'S DESIRE

Appealing story of much human interest, featuring the great voice of Richard Tauber. From Viennese Biergarten, hero rises to successful opera career, but disillusionment brings him back eventually to his beloved Vienna and true love.

## CONCERT IN TYROL ORPHAN BOY OF VIENNA

Two outstanding German Language films with stories told against backgrounds of fine music.

### Put Your Projectors to Work for the SIXTH WAR LOAN

The U. S. Treasury Department — War Finance Division — has made available for the 6th War Loan drive a group of 16mm sound motion pictures produced by the Navy and War Depts. Projectors and operators are needed. Contact your local War Finance Committee at once!

Spencer GK Delineascope used by Air Force Technical Training Corps, University of Chicago.

## Seeing and Learning *Quickly*

In the first 28 months of its existence the Army Air Force Technical Training Command turned out more than 500,000 ground and combat crew technicians. An amazing total contrasted with the record of the preceding 20 years during which the Army Air Corps had graduated only 14,803 such technicians.

One factor which is helping to instruct such unprecedented numbers in so short a period is the use of visual methods.

Spencer Delineascopes are in daily service in this vital work.

## Editorial

### *Putting Away Childish Things*

**T**HE visual field should concentrate, for the immediate future, upon achieving its long over-due maturity with minimum delay. Discard of our adolescent habits of thought, speech and action is a first step to speeding up the process. No new slogan is needed. The idea was perfectly stated by Paul some nineteen centuries ago: "When I was a child, I spoke as a child, I understood as a child, I thought as a child. But when I became a man, I put away childish things." That is still an exact formulation of the primary essential to visual progress from now on. The list of desirable discards is long.

In our correspondence, even today, appear incredible bits of childish thinking, or perhaps gems of naïvete: . . . . "I am writing a thesis in education. Should I give a chapter to visual education? If so, what are the facts to be included?" . . . . "In this six-grade school, enrollment 350, how much visual education should be given per week?" . . . . "It seems to me there are too few schools using films. Would you care to publish an article giving them reasons for so doing?" . . . . "There are great possibilities in visual instruction. I would be glad to take charge of the work in some school that wants to try it. Kindly name me a few such schools." . . . . "What is to be said for teaching with movies? I am to speak on this subject before the Kiwanis Club next week." . . . . "Can you tell us where we can sell six E . . . . educational films. We have shown them all, some of them twice, to the whole school and we are tired of them." . . . . "It seems hopeless for us to get started on visual education. Before we had saved enough money for a silent projector, sound projectors appeared. Nothing to do but wait, I suppose." . . . . "Where can I get a motion picture film on Chess?" . . . . etc. etc. It is having to answer such "problems" for twenty-odd years that makes us old before our time, but we can stand it still longer if only we can detect some diminution in the stream. Needless to say, such communications never come from our subscribers, always from non-subscribers, which suggests a very simple cure for this manifestation of professional adolescence. Reading the EDUCATIONAL SCREEN will automatically answer or prevent such questions.

In our teaching there is plenty of material for the discard. We need to banish the notions that "interest" is the sole measure of learning; that interest carried to the point of excitement means greater learning; that, since children like movies better than stills (all human eyes do), they must therefore learn more from movies; and hence—crowning puerility of all—that movies are

a synonym for visual education. Few teachers indeed would try to teach their Botany class an oak leaf by waving it before their eyes. Yet many forget that the vast majority of concrete percepts need motionlessness for optimum learning, which means that quantities of still pictures and slides are essential. On the other hand, to put static details into action—to show change, movement, growth, continuity, narrative, behavior, drama—the motion picture is the unique and all powerful means to the end. Practically every lesson topic needs both, for most effective teaching with least waste of time and effort. When that fundamental fact is grasped and put into universal practice, visual teaching will reach the ultimate in efficiency.

Also on the discard agenda is the widespread misuse of both media. Too often slides are used merely to punctuate a lecture, to dress up a teacher's monologue to the class; and films serve to park a class contentedly during a 12 minute rest and relaxation for the teacher. We have seen the necessary "preparation" effort by the teacher neatly dodged by this cliché: "Now, children, I am not going to tell you anything about this film. I want to see how much you can learn from it all by yourselves." Again we have seen the "follow-up" brought to an irreducible minimum of effort by the teacher and of value to the students. It can be made a general futility exercise by such questions as the following: "Did you like the picture, children?" It usually evokes perfunctory nods (to please teacher) from most of the group, with the ultra-energetic pupils perhaps vocalizing a feeble "yes", with no trace of cerebration required from any one, not even from the teacher. Or we get "What did you see in the picture?", a ridiculous inquiry which would consume the whole discussion period were some voluble youngster to answer it. Again, "What did you like best in the picture?" is perhaps the prize-winner in stupid questions, for it is not directive, may bring an answer totally irrelevant to the subject supposedly being taught and, once the most forward and fluent pupil takes the floor for answer, it absolves all the rest from any need of thought at all. Finally the crowning weakness in follow-up discussions is probably the all-too-common practice of calling on the hand-raisers for answers. Ten percent of the class can, and often do, do it all. The ninety percent, merely by keeping their hands down, can keep happily free of mental effort through the entire performance. And normal youngsters learn the trick fast.

In our writing it should be possible to eradicate gradually most of the repetitiousness that has stultified so much of our utterance, spoken and written, for two

decades. In the early days there was justification for frequent iteration of "seeing is believing", "the eye is the shortest path to the brain", "pictures are the universal language", including, as too many did, the famous Edisonian absurdities about films replacing textbooks "in ten years" and teachers in a few years more. The basic idea was more or less new and had to be hammered home. But visual instruction has grown up. Its literature must keep pace. We are hoping for the day when no more articles will come in, even from the newest writers, with the "old Chinese proverb" in the first paragraph and the rest of them devoted to informing us that pictures used should be of good quality, should relate to the subject in hand, that there should be preparation before, and follow-up afterward, that the purpose is instruction and not entertainment, etc. etc. *ad somnum*. The field of visual education now deserves a literature of sense, significance and solidity, a literature to be taken seriously by the whole educational field.

In our research, above all, we need to put away childish things. The total number of theses, studies, experiments, investigations and surveys already put out in the visual field will probably never be known. The field will not suffer if it never knows. They were doubtless all justified as time-serving assignments to meet requirements for graduations and degrees. A goodly number have been immensely valuable. The ratio of good to poor has been perhaps as high in the visual field as elsewhere. But the duplication of effort and results has been appalling, for the workers seldom knew what others were doing or had done. We should begin, now, to distinguish the worthwhile from the futile in research. We should eliminate, as fast as may be, any further research on the obvious; research that proves the already proven; research to establish preconceived convictions; and especially material offered as research but designed merely to promote special interests in the commercial field. A vast amount of important research remains to be done in this field. But its importance and worth will hinge upon selection of logical subjects, on scholarly control of procedures, and on singleness of purpose to arrive at truth, whether that truth be usable as propaganda or not.

Discards, however, are minor matters which should give way to mature plans, thoughts, and actions. The field will benefit by some deletion but far more by additions and innovations. It is these that concern us chiefly for the future. EDUCATIONAL SCREEN plans numerous contributions to the program of progress that lies ahead.

### **The Shape of the Postwar World**

SPECIAL attention is called to the first article in this issue. The war is not over as the Sixth War Loan effort grimly reminds us, but it is not too early to look ahead to the postwar world in our field as well as other industries. William F. Kruse in this remarkable article outlines some of these problems from the point of view of his long and broad experience in the industry. In our last

issue we called attention to the need for full and free intercommunication between "the thinkers who plan, the consumers who use, the producers who create and supply." Here is an article from a producer which answers this description and will stimulate all workers in this growing field.

"The Curriculum Clinic," a new feature initiated in this issue of EDUCATIONAL SCREEN, also deserves special commendation. Here educational problems, direct from the classrooms and classroom teachers of the country, will check ideas with practice and curriculum theories with practical classroom procedures.

### **"Freedom Comes High"**

\$14,000,000,000.00 is a lot of money whether you write it in numerals or simply fourteen billion dollars. This, we remind you, is the announced goal of the Sixth War Loan Drive which begins on November 20, and this is an appropriate time to remind you also of the important part which films should play in the successful prosecution of the Drive. A lull in the vigorous prosecution of the war at this time would only increase its eventual cost in American lives and money.

The picture on the front cover of this issue of EDUCATIONAL SCREEN is from one of the special 16mm. subjects prepared for the Sixth War Loan Drive—"We Said We'd Come Back." The illustrations on pages 385, 386, and 387 are from other Sixth War Loan titles. We call particular attention to the Navy release, "Freedom Comes High." This title was produced for the Navy by Paramount and stars James Craig and Barbara Britton. Hollywood scouts report that it is an outstanding film, perhaps Academy Award merit. "Freedom Comes High" and all ten of the special 16mm. war films are powerful messages and will help in educating the public to the importance of "finishing the job."

The duration of the war is at stake, the outlines of peace may be at stake, and certainly the effectiveness of films in future social education of the public is on trial. Do your part as suggested in the October issue in securing these subjects from your local State War Loan Office, using them in your own programs, providing projectors, operators, and meeting halls for your local War Loan organization.

### **Important Announcements from Britannica**

MR. E. H. POWELL, President of Encyclopaedia Britannica, announces the appointment of H. R. Lissack as Sales Manager of Encyclopaedia Britannica Films, Inc., and the removal of the sales and accounting offices of that company, effective December 1, 1944, from New York City to 20 North Wacker Drive, Chicago. The Research and Production Departments under the direction

# Non-Theatrical Film in the Postwar World\*

*A thought-provoking analysis relating future international issues to practical educational and commercial problems.*

WILLIAM F. KRUSE

Manager Films Division, Bell & Howell Company, Chicago

ANY attempt to forecast the conditions under which the non-theatrical film industry will operate in the postwar period, must necessarily take on something of the nature of prophecy. Prophets are notably poor insurance risks. Throughout history they lived fast and died likewise. Prophecy is a strictly personal business, so if I venture out where the ice is thin, please remember that these views are strictly my own, and "any resemblance to persons or policies" of the firm I happen to work for is strictly coincidental.

In all seriousness, though, there is less prophecy than analysis involved in weighing the prospects and problems of our business in the postwar world, for the basis of all the business we can hope to do tomorrow is, fundamentally, the work that we do today. We should get out of our heads any notion that postwar problems will be so very radically different from those we face today. To be sure there will be some differences: we won't need priorities on raw stock and projectors, for instance, and there may even be temporary crises due to sudden oversupply of the things we now lack. But we will still have to get new films, and find new customers for old ones, and service those customers so they will stay happy. Just as we do today.

We will not be able to draw a line across the page, everything above the line headed "war", and everything below the line "postwar". Much will depend on the nature of the peace that follows our military victory. If our postwar policy, at home and abroad, is imbued with a forward-looking cooperative effort such as now characterizes most of our war effort, our business is likely to continue on an even keel and with a consistently expanding volume.

But if we should set out on an imperialistic spree, grabbing everything in sight that is not nailed down, and setting back the clock at home to the dog-eat-dog morals and economics of the pre-1929 era, there is no predicting what our business will be like. Some of us may be lucky or "smart" enough to scramble to the top of the heap, by pushing our feet into the other fellow's face, but the total volume of our business will not grow to anything like the brilliant potentials that should result from our film services to the war effort, *unless* the whole of the American people continues to enjoy a considerable margin above a bare subsistence level. These marginal dollars are what keeps our non-theatrical film business growing, and our market can expand only if the great mass of the American people continue to have them to spend. Prosperity for one group at the expense of others will not give us a

stable, growing market, any more than will prosperity for any one nation at the expense of others. We are now one nation, and, to a greater extent than ever before, one world. A relative prosperity at least must prevail for all, if it is to be enjoyed, on any lasting basis, by any.

It is possible, of course, that history may repeat itself and that the shape of the postwar world and its problems, will copy that of "last time". That would be a calamity. Only by avoiding the selfish "head-in-the-sand" policies of "last time" can we be sure there will be no "next time". It is possible that the people of this country may become so fed up with the restraints and restrictions of wartime, that they will listen to the first wily demagog who comes along with a promise to bring them back to their own old pipe and slippers—so they can pull down their shades, and not look at or think about the cruel, cold world outside. After all, that is what happened in 1862, and again in 1918 and 1920. But I don't believe that the American people really want to go back to the cynical, selfish, isolationist attitude that prevailed in the 20's. That era is not one of the brightest spots in our history. Yes, it was the era of million-share days on the Stock Exchange, and of paper fortunes made and lost over night—but at the end of the 20's came 1929 when we had to pay the price. "Nothing down and a dollar when you catch me" was our slogan, as individuals and as a nation. Well, in 1929—the bill collector caught up with us and what a weeping and wailing there was.

That was the era when we tried to chisel on our installment purchase in world affairs, too. In 1918 we ran out on the problems of World War I, the problems of peace between nations and fair play for all peoples. For two decades we toadied to Franco, and Mussolini, and Hirohito, and Hitler, and all the other fascist gangsters. All we asked was that they

Scene from the Navy film "Freedom Comes High"

\*Address delivered at the War Conference of the Allied Non-theatrical Film Association, New York, April 28, 1944.

let us alone—we didn't care how many freedom-loving Spaniards, or Ethiopians, or Chinese, or Germans, Czechs, Austrians, Poles, and other oppressed peoples they robbed and killed. Just so long as we kept on getting ours. The first installment on that policy caught up with us, finally, at Pearl Harbor. We paid plenty there, and we keep on paying in blood and gold, each day the war lasts. We didn't really get away with anything by pulling down the shades and pretending there was nobody home when the bill collector came around the first time. This war should prove to us, once for all time, that if we want to live in peace and justice in our own home, we cannot tolerate robbery and torture out on the sidewalk, right in front of our door. And, to get down to business, if we want to do business—good business—with a lot of decent foreign customers, we cannot allow a gang of fascist racketeers to take all their money away from them, even to the shirt off their backs and often their very lives in the bargain. Sad to say, it took a Pearl Harbor to bring this home to most of us—but I am sure that all of us, again without any Party labels whatever, are determined that never again shall international banditry be tolerated in this world. We are confronted with a worldwide issue that is not between parties, or between candidates—it is an issue between viewpoints, an issue between the past and the future.

Most of us here are convinced, I am sure, that the certain and complete defeat of our reactionary foes can be followed by one of the greatest periods of progress that mankind has ever seen, and that we should strike for a perspective of harmonious collaboration of free peoples in the reconstruction of a wracked and ravished world. What does this perspective offer to us in our own non-theatrical film business? It would give us, first of all, a *busy* world, with pretty nearly everybody *working* full speed, and getting a fair return in money, and in leisure, to permit decent life. It would give us a thinking, talking, socially active world, where neighbors would meet often to discuss common interests, in churches, schools, block organizations like the present OCD, factory personnel groups—in all kinds of social units. A world in which accent will be laid on education—on culture for all—and where school will be taught with the full benefit of all the marvelous teaching experiences developed by the armed forces.

The same decent, respect-motivated attitude is possible also between nations. One good thing the war is doing is to bring us much closer to two of the greatest peoples on earth, the Russians and the Chinese. If we can just act decent, they will constitute a market for our products that will keep our factories humming, and will send us in return commodities that will enrich our lives. Ambassador Davies is quoted recently to the effect that there is no point of conflict between the Russian people and our own. I know from my own personal experience the high regard that the common people of Russia have for everything American. I have traveled, literally, from Murmansk to Samarkand, and from the Crimea to Siberia, and I have *never* found anything but the friendliest feelings. I have worked in their factories and studios, slept in

Another Shot from "Freedom Comes High"

their best hotels and on earthen floors on peasant huts, always a foreigner yet always welcome as their friend. And now our two peoples are engaged in a great joint struggle against a common enemy of both our respective ways of life. When that struggle is over, let us hope that we may maintain our attitude of friendly collaboration, each following that path of freedom that to himself seems best fitted to secure the greatest happiness to the greatest number.

The ways of the two peoples are not nearly so different as political phraseology would seem to indicate. Their aim also is to live in a more comfortable house than the one in which they were born, to give their children a better education than their own, and to build bigger and better factories, libraries, club-houses, airfields, farms, roads and other adjuncts of civilization than they had a year ago. Many social achievements, such as factory safety committees, incentive and suggestion plans, bonuses, bond drives, group insurance, and employee theatricals and good fellowship are duplicated exactly in the two lands. And, to make the parallel altogether complete, their interest in non-theatrical movies is every bit as great as our own. I had no trouble in working at my chosen profession in that country as readily as in this. I had a swell time doing it in both lands—and I have such respect for your intelligence and humanity as to feel that each and every one of you would do pretty well yourselves, in either country.

The postwar world should see vastly more inter-communication of peoples by means of films and television, and this trend should prove one of the most potent agencies for peace that man has ever contrived. There may be more intense competition for the consumer's dollar, but if we all, as rational human beings, play our cards right, there will be plenty of consumer dollars for television as well as for movies. No society ever got poorer by making the lives of its people richer. Whatever else there may be about our business after the war, we know it will be bigger—and that it will play an even more vital role in the service of the American people, and of humanity at large, than ever before. It will be worthy of the best that any of us, and all of us, can give it.

# The Use of Audio-Visual Aids in an Airlines Training School

*A stimulating resume of visual materials and methods that produce efficient training in the air-transport field.*

H. L. ANDREWS, Coordinator of Training  
Pennsylvania Central Air Lines, Washington, D. C.

THE demand for better training in industry has necessarily brought about many changes in teaching methods. These changes were largely in the form of refinements of methods in order to have time and to do a better job. Since hundreds of new employees must be taught the skills of the new jobs, it is only reasonable that the instructors in industry would welcome new methods to speed up the job. The jobs in Airplane Transportation are numerous. They range from reservationists who sell the tickets in station operation, through administration, maintenance, traffic, flight dispatch, to the pilots who fly the great silver ships. These jobs are highly specialized. The courses are short and the instruction is necessarily intensive. It becomes the job of the training department to employ the best methods, devices, and techniques in the training courses, in order to do the best job in the shortest time. The lecture method has been replaced by the laboratory method; and the laboratory method has been supplemented by audio-visual aids.

A typical hostess classroom

Audio-visual aids are too well known to need any explanations or arguments to justify their place in modern instruction. This article, therefore, illustrates special and unusual forms for this very special task. Sound and silent films, slide films, and slides have been effectively used.

Airline record forms

Mock-ups, charts, diagrams, maps, nomograms and recording devices supplement the photographic aids. Many of the latter types shorten the learning process and in many instances are more easily adapted to certain units of study.

Let us consider a few of the devices used in the classes at the Pennsylvania-Central Airlines Training School. Food Service is a complimentary service on the Airlines. The food must be excellent. It must be served in an attractive and efficient manner. The food is placed in the plane in trays practically ready to be served, but there are many little tricks that the hostess must know, such as removing the food from the containers, arranging the food properly, and carrying the tray in order to avoid accidents.

Buffet mock-up

The student hostesses were formerly given some of their training during flight. A student hostess accompanied a veteran hostess on a trip and there-by was taught the tricks of the trade. Later entire classes were taken on trial flights and the training was given to the group. This has all been stopped by the war. There are no extra seats for the student hostess, and there are no planes for trial flights.

The instruction is now given in the classroom from a mock-up buffet. The opinion is that the training is equally as good as that in which the former methods were used.

Practice at phone

Recording machine for phone conversations

Many very excellent conversationalists find that talking over the phone is a difficult procedure. Since the reservationist makes most of the ticket sales by phone, it is necessary to stress the techniques of phone conversations. A dummy phone line is set up in the classroom. The instructor and student practice conversations that might take place between the passenger and the reservationist. The importance of talking directly into the mouthpiece, the quality of the voice, the reservationist's attitude, and when and how to hang up the receiver when the conversation is finished are very important. After a fair degree of perfection has been attained, records are made of typical passenger-reservationist conversations. These records are

discussed and refinements in phone conversations continue until the student acquires sufficient proficiency to talk to the public.

Nomogram on arrangement of Capitaliner

The nomogram is a term applied to a visual device used in teaching materials in which a large number of titles or terms are used. It consists of a miniature diagram which is frequently in several parts that must be properly arranged. Titles or names are printed on separate cardboard or beaverboard strips. The titles must be placed by the student in the proper places on the diagram and a reason given for the placement. Practice in using the nomogram is a great time saver for the student in learning detailed nomenclature.

Fire extinguisher directions

The importance of safety is much more forcibly impressed on the student with visual devices than by merely committing rules. Each student learns to manipulate the fire extinguisher. The procedure for the use of the extinguisher is printed in logical sequence on the board holding the extinguisher and the procedure is carefully followed in each student demonstration.

Mechanical Training Classroom

Mechanical Mistakes

Many different adaptations of visual aids are used in the mechanical courses. Mock-ups of the hydraulic system and the gasline have been used effectively.

Another device that has a very excellent teaching

value is a collection of parts that have been incorrectly placed in the planes. Each gadget is a fine example of poor work and lack of thorough understanding of the job.

We feel that lecturing on theory in mechanical courses is a waste of time unless the theory is illustrated by the actual parts of the machine or by use of the mock-up.

Map of Routes

The Airplane Transportation employee must know much of what was once called old fashioned geography. Routes of our line as well as routes of the other airline companies must be thoroughly learned. The student has access to large maps. Each route is marked with cellulose tape by the student. When one route is completed, another is added until all the routes of the major companies are learned. This plan of study seems to eliminate what might be considered the drudgery of geography.

The success we have had in using audio-visual aids has been very gratifying. Consequently, these aids have become an integral part in all the training courses.

## Putting Away Childish Things

(Continued from page 384)

of Dr. V. C. Arnsperger will continue to operate at the present location, 1841 Broadway, New York, New York.

Mr. H. R. Lissack is a vigorous and capable sales executive with the rare qualifications of a solid background in many phases of educational work. Twenty-two years as Superintendent of Schools in cities of Wisconsin and Illinois marked him as a progressive educator. In 1941 Mr. Walter Ynst, the Editor-in-Chief of Encyclopaedia Britannica, called Mr. Lissack to direct the editorial work of Britannica Junior, an encyclopedia for elementary school children. He accepted this position, discharged his editorial duties expertly and made many additional contributions which brought to the front his ability as a business administrator. Mr. Lissack proved himself to be exceptionally sales minded, having the unique ability to interpret the sales problems of Britannica Junior in terms of the educator's point of view.

In his new position and at the new location of the company Mr. Lissack has a rare opportunity to dedicate both experiences—the educational and the commercial—to contributions of great importance to visual education.

EDUCATIONAL SCREEN presumes to speak a hearty welcome to the newcomers on behalf of all of

H. R. Lissack

the organizations now engaged in the production, distribution, and utilization of audio-visual aids in Chicago and the Middle West. A more elaborate and a more official welcome is planned as a special feature of the December issue.

# The Field Trip: Education by Contact

*A thought-provoking presentation of a single field trip which was made notable by the extraordinary cooperation achieved.*

D R. G U S T A V E S C H W A M M  
Russell Sage College, Troy, New York

THE current interest in realistic educational procedures is not new except for its intensity. There has been a potent renaissance of the concept that techniques which make learning a rich and exciting adventure are worthy of adoption, especially when they result in a type of education that is more meaningful to individuals than is possible through the exclusive use of verbal methods.

The publicity incident to the Army's and Navy's teaching methods may account in part for this very noticeable trend. Civilian educational institutions can hardly use all of the military's devices; for example, the Signal Corps' system of teaching topography and map-making with Miss Betty Grable as a motivating device! However titillating an experience, it is obviously inappropriate for primary and secondary schools.

Schools have long used various visual, auditory, and other sense aids. And they have also employed the field trip, the further exploitation of which may prove that it has greater educational possibilities than heretofore realized. It is with this educational technique that the present discussion is concerned.

In its essence the field trip is on-the-scene educational experience. Depending on the circumstances, every one of the senses may be called into play. Reading about the activities on a wharf, on the one hand, and observing them directly are entirely different things. The first instance is fertile with significance for the student endowed with a keen imagination. The latter, however, conveys more to a student who must observe things directly, or to whom symbols are poor substitutes for the real thing.

The field trip—frequently called "excursion"—has shortcomings as well as advantages. Among the former there are the elements of impracticability, such as the unwieldiness of large groups, items of expense, and remoteness of scene. These are not entirely insurmountable.

Another class of disadvantages is that consisting of faulty preparation preceding the visit, carelessness or indifference during the trip, and ill-planned or no follow-up whatsoever. Oftentimes, too, the motivation may be spurious, amounting to little more than the anticipation of a pleasant release from the monotony of the classroom routine. When that occurs the field trip, instead of promoting real educational objectives, easily degenerates into a mere holiday for student and teacher alike. Other items can doubtless be found to discount the educational worth of the field trip. But aligning them alongside the advantages, we should probably find the balance in favor of this technique, although careful research with a statistically reliable number of cases may give us a more accurate answer. These paragraphs made no pretense at anything other than empirical statement. Support can be found in

the past or future experience of others who have used or plan to use excursions as a supplementary teaching scheme.

The field trip is life itself, or part of it. It is real, dramatic, and more than a substitute for verbalism. It affords the opportunity for an exhilarating experience, and may have an incalculably salutary effect, long remembered where a mere verbal impression might soon be forgotten. It is not the function of these thoughts to elaborate on the theory of the field trip, but rather to describe and comment upon the specific trip which has in it unusual indications of educational possibilities.

There was, to be sure, preparation before and follow-up after the event. But what is significant was the factor of cooperation. That was extraordinarily prominent. True, such cooperation with teacher and student group might not be possible in all cases because of the nature of the thing to be witnessed. On the other hand, one could name situations where cooperation might easily be forthcoming without serious inconvenience to anyone and yet with inestimable benefit to students. The cooperation meant here is that part of it coming from the agency visited.

## One Field Trip

The trip in question was a visit to court. There is nothing unique about such an excursion; in fact, it is fairly common. There was the usual uncertainty of knowing exactly what case might be heard at trial, due to the state of the trial calendars and the fact that cases may be dismissed, settled, or adjourned. The particular case heard was an action on an implied contract, and it was unadorned by any confusing factual or legal complexities.

A large group of students took seats in the courtroom and found no difficulty in maintaining the required decorum. The solemnity was an inspiring thing, conveying to these youths, quite wordlessly yet with dramatic intensity, the seriousness of the legal process in a democracy.

That there was a class present in court was apparent to the judge who, after the trial was under way, dispatched a note to the writer, inviting him to sit upon the bench. This incident alone illustrates the factor of cooperation in the worthwhile field trip, more of which could readily be realized if this type of educational device were more widely practiced.

The court's sympathy, understanding, and awareness of the importance of a knowledge of democratic processes for today's youth—tomorrow's more active political participants—were magnificent. In spite of a certain austerity which characterizes the courtroom

of any businesslike judge, there were also moments of humor to relieve the tenseness of the scene. The reader might easily conclude from the judge's remarks which follow, that they were planned by him in advance of their utterance. But the reader may be assured of their wholly extemporaneous character.

Examining the court stenographer's transcript of the judge's statements, we find in it a very valuable lesson, replete with expressive, well-considered remarks. In his first words to the students he said with dignified humor:

"Before adjourning I am happy to say a word to the extra large gallery present today. We really played today to a larger house than we usually have. . . ."

Later on, he reviewed for the group the events of the trial and their implications, in a manner which one could hardly expect their own youthful minds to do. With clear phrases, free from any authoritarian flavor, this jurist described, by way of summary, the mechanics of the trial, the legal intricacies of testimony, and the purpose of the charge to the jury. And he did so in the following words which are quoted directly from the minutes of the trial:

"You have observed one of the courts functioning at close range. You saw the trial of a case open up this morning and you have watched it through almost to the end. All of the evidence is in, the attorneys have spoken for their respective clients and nothing remains but for the trial judge to instruct the jury as to the law to be applied to the case. It will be for the jury under those instructions to determine the facts from the conflicting evidence offered here today. As you have undoubtedly observed there have been a number of contradictions in testimony; that is usual, common, ordinary. That doesn't mean necessarily that either of the witnesses is untruthful. So much depends upon the functioning of the human mind and the ability of each party to observe things and to report them accurately."

The court then continued, enlarging upon the meaning of the jury charge, and clarifying the distinction between the function of the jury as a fact-finding body and that of the judge as the determiner of matters of law. He indicated further the redress which the defeated party may have after trial by way of appeal. All of this is in the following remarks:

"It remains now for the trial judge to instruct the jury as to the law. Those instructions will include an instruction to the effect that it is for the jury to sift out from this conflicting evidence that which the members of the jury put faith and trust in, believe in and, finally, after correlation of evidence, to reconcile it as far as possible. The jury and jury alone will come to a conclusion as to who should prevail in these separate cases. After the jury has reached a conclusion in each case and decided whether the plaintiff or the defendant shall prevail, then a written verdict is brought in and reported here in open court, and if it is in proper form it becomes a part of the record in the case unless some error of law has crept in at some place in the proceedings, either before the beginning of the trial or during the trial."

Commenting upon the trial as a democratic procedure as well as upon the dynamic quality of the law, which is synonymous with a flexibility whereby it adapts itself to changing social needs, the remarks of this judicial officer, although completely spontaneous, were about as significant and well-stated as might be desired. One need hardly doubt the effect of the words which follow on the minds and emotions of an average

(Concluded on page 394)

## Department of Visual Instruction

These are meeting days. Reports coming to EDUCATIONAL SCREEN indicate unusual interest in visual education meetings at State Teachers Conventions, and in DVI zone meetings in all sections of the country.

Teachers interested in visual aids, who are not already members of DVI, should communicate with their respective zone officers.

### National Officers

*President:* Mrs. Camilla Best, Director, Division of Audio-Visual Aids, Orleans Parish School Board, New Orleans, La.

*Secretary-Treasurer:* Miss Lelia Trolinger, Director Bureau of Visual Instruction, University of Colorado, Boulder, Colo.

### Zone Officers

**Zone I** (Connecticut, Maine, Massachusetts, New Hampshire, Rhode Island, Vermont)

*President:* Dr. John Gammons Read, Rhode Island College of Education, Providence, Rhode Island.

*Secretary:* Miss Dorothy A. Allard, 8 Wells Road, Reading, Massachusetts.

**Zone II** (Delaware, Maryland, New Jersey, New York, Pennsylvania, Virginia)

*President:* Dr. James S. Kinder, Pennsylvania College for Women, Pittsburgh, Pennsylvania.

**Zone III** (Indiana, Kentucky, Michigan, Ohio, West Virginia)

*President:* Mr. H. B. Allen, West Virginia University, Morgantown, West Virginia.

*Secretary:* Mr. William G. Hart, William Ford School, Dearborn, Michigan.

**Zone IV** (Illinois, Iowa, Missouri, Wisconsin)

*President:* Mr. Alvin B. Roberts, Haw Creek Township High School, Gilson, Illinois.

*Secretary:* Mr. H. L. Kooser, Iowa State College, Ames, Iowa.

**Zone V** (Minnesota, North Dakota, South Dakota)

*President:* (to be elected)

*Secretary:* Mr. O. S. Anderson, Horace Mann School, Fargo, North Dakota.

**Zone VI** (Idaho, Montana, Oregon, Washington)

*President:* Mr. Glenn Jones, State College of Washington, Pullman, Washington.

*Secretary:* Miss K. S. Klise, Sunnyside High School, Sunnyside, Washington.

**Zone VII** (Arizona, California, Nevada, New Mexico)

*President:* Mr. Boyd B. Rakestraw, Extension Division, University of California, Berkeley, California.

*Secretary:* Mr. George M. Jamieson, Jr., 815 South Hill St., Los Angeles, California.

**Zone VIII** (Colorado, Kansas, Nebraska, Utah, Wyoming)

*President:* Dr. J. R. MacNeel, University of Wyoming, Laramie, Wyoming.

*Secretary:* Mr. C. C. Lenmon, Granite School District, Salt Lake City, Utah.

**Zone IX** (Arkansas, Louisiana, Oklahoma, Texas)

*President:* Dr. B. F. Holland, University of Texas, Austin, Texas.

*Secretary:* Mr. D. W. McCavick, Bureau of Visual Instruction, University of Texas, Austin, Texas.

**Zone X** (Alabama, Florida, Georgia, Mississippi, North Carolina, South Carolina, Tennessee)

*President:* Dr. W. H. Ward, Extension Division, University of South Carolina, Columbia, South Carolina.

*Secretary:* Mrs. H. L. Harris, University System of Georgia, 223 Walton St., N.W., Atlanta, Georgia.

# The Film and International Understanding

## "WILSON"

### Some Implications For Understanding

THE very title "Wilson" has immediate interest for all of us who are interested in the film and international understanding. For any consideration of Wilson the man is inseparable from some consideration of the international affairs and ideals which made up so great a part of his rendezvous with destiny—both his own and that of the world. Even in a theatrical film, made for entertainment, the two are inseparable. So much has been written about the film that it is unnecessary here to review its script or its technique. It is enough to recall that it is a film of great scope and proportions, full of action and emotional appeal.

#### A "National" Film

*Wilson* seems destined to become one of what we might call our great national films. And the word "national" is used here to include more than one meaning. The film is "national" in the sense that it deals intensively and humanly with one of the great crises in our history; it is "national" in the sense that it probably will be seen by the great bulk of our people; and it is "national" in that in this experience of seeing it will be remembered and talked of for years to come as one of the great experiences of a particu-

Democratic National Convention of 1912.

lar time. There have been other such "national" pictures: *The Birth of a Nation*—*The Covered Wagon*—*Gone With the Wind*. The film *Wilson*, produced by Twentieth-Century Fox, seems destined to become another.

#### Theatrical vs. Educational

Should educators ignore a film of such significance? Does the fact that it is a "theatrical" film, a commercial enterprise, available only in 35mm, bar it from educational considerations?

If we think of education in a broad sense, we must realize that the film will produce an effect which is educational in a number of ways upon thousands and thousands of those persons, both juvenile and adult,

DR. JOHN E. DUGAN, Editor  
Haddon Heights, New Jersey

who go to see it purely for entertainment. We cannot lightly dismiss this effect, neither can we overlook the fact that much of the force which motion pictures will have in promoting international understanding

Wilson, addressing a joint session of Congress, asks for a declaration of war against Germany.

throughout the world will be brought about in a similar way and under somewhat similar circumstances. Evaluation and guidance of this type of learning from theatrical films offers a challenge to leadership and technique in the field of adult education.

Does not this type of learning among youngsters offer just as great a challenge to teachers in our schools? Should the experience of seeing a film such as *Wilson* be ignored? Should it not rather be directed and discussed? Rightly directed, the student can build up a background for seeing the picture and for intelligently discussing what he has seen afterward. We direct and discuss reading which is done outside

In the East Room of the White House, Paderewski plays his "Minuet" before a distinguished group.

Georges Clemenceau, David Lloyd George and Wilson

of the classroom in this way. Why not the seeing of worthwhile films? In the field of international understanding, a film such as this may add flesh and blood to what otherwise might seem to be dull and lifeless abstractions. A film can be educational as well as theatrical.

#### Can Films Be Classics?

Are films too transitory in the theatrical field to receive serious educational consideration? Consistency forces us to admit that many contemporary books and plays with no more claim to permanency are cheerfully added to school reading lists all over the country. Most of the books which we now consider "classics" never were written as educational books. Neither were most of the plays which we consider in the same category. They were written for entertainment and commercial production. Need the films do more?

#### Is Accuracy Educational?

There are those who would debar from educational consideration any film which has not been checked and rechecked for accuracy and validity in every last detail. Some even seem to establish this as almost the sole standard for judging the educational value of a film. Used with intelligence, this insistence upon accuracy is beneficial; but it can be carried to extremes of absurdity and stupidity. It is of little value if it is bought at the price of interest and proper emphasis, or if it is based upon purely arbitrary decisions regarding which even eminent scholars may differ.

In this respect the film *Wilson* can illustrate some interesting points. Sometimes essential points were brought out by characters who of necessity had to be partly or wholly fictitious. Some events had to be portrayed as well as possible, even though equally eminent historians and scholars were not in complete agreement about them. Does this destroy the usefulness of the film? Not at all. In some respects it enhances it, for it offers opportunities for intelligent study and discussion. An educational experience which stimulates study and discussion is far superior to one which appeals to nothing more than placid acceptance.

The very background and nature of *Wilson* make

it a film to arouse study and discussion. In Philadelphia the Library distributed copies of a reading list for use in connection with the picture. The list contained fifteen books which were classified under two headings: "Books by Woodrow Wilson" and "Books about Wilson". There have been movies which stimulated the reading of some particular book. Here is a movie which boosted a bibliography.

Carrying this idea into the visual education field, a bibliography of supplementary educational films for classroom showing and discussion might be compiled. Naturally enough, the emphasis here would depend upon many considerations; but a beginning might be made with the following:

*Headlines of the Century*, covering the period between 1910 and 1923.

*Mr. President*, showing inauguration of F. D. Roosevelt and inauguration scenes and important events of administrations from Theodore Roosevelt to the present administration.

*Causes and Immediate Effects of the First World War*, using animated maps, news-reel scenes and commentary.

*The League of Nations*, tracing rise and decline of League's power.

## The Field Trip

(Concluded from page 392)

group of adolescents, particularly when spoken on an occasion such as this and in the surroundings of a courtroom:

"This method (by trial) of reconciling disputes between individuals is the best method that has been devised in human experience. The law is a growing, developing something which has its roots in the distant past, and it develops as people become more intelligent and tolerant. In old days individuals used to settle their controversies and differences by a battle and the battle didn't accomplish any more than is accomplished by nations which are now trying to settle their differences by battles and wars. In those wars wherever new scars appear a healing process has gone on, but it hasn't been humanly possible yet to set up any tribunal wherein controversies between nations can be settled."

And in what more fitting manner could the court have said in effect, "Thank you for coming; I hope you enjoyed your visit," than in these sentences with which he closed his remarks to the class:

"But getting back to today and your visit here, as the presiding Judge I am happy to note that you have been, under the guidance of the members of your faculty, interested to come here to see how one part of the state government functions and, as I said before, I sincerely hope you have found it pleasant and profitable."

No attempt has been made herein to present the refined statistics of research. But need anyone doubt the educational possibilities in this kind of experience? Can not the same cooperation be elicited from the many types of activities one might visit on a field trip, whether in the realm of the social sciences, business education, the natural sciences, or the arts?

The potentialities in the excursion seem great; and the belief seems justified that if we were to embark upon a program designed to publicize and enlarge the scope and use of the field trip—yes, even to the extent of allocating funds for that specific purpose—then the kind of cooperation we have here described would become more common.

# The Curriculum Clinic

## A New Department

WALTER A. WITTICH  
The University of Wisconsin

IF a roll of the pioneers in the field of visual education could be drawn up, it would probably start with the names of David Sumstine, Joseph J. Weber, F. Dean McClusky, and Frank Freeman. These men, and others, plunged into the wilderness of untried techniques and tools with the determination to discover, if they could, the character, the function, the advantages, and the possible effective uses of this new and promising adjunct to classroom method. The period of their initial research can be designated as from 1918 to 1924. It was during this time that comparisons between visual and traditional methods of classroom presentation were begun. It was the time of Weber's research which inquired, "Are visual aids merely a fad or do they have a distinct value?" and of Freeman's first comprehensive survey, in the form of 13 separate studies, which investigated the effectiveness of the silent film under varying classroom procedures and in competition with other traditional media.

The second period of research, 1924 to 1930, was marked by the continuing work of Frank Freeman, Daniel Knowlton, J. Warren Tilton, Ben Wood, and investigators in England who succeeded in removing many of the unsatisfactory conditions found in previous studies. Their attempt, in addition to substantiating further the function of the motion-picture film in the classroom, was to determine to what extent the new technique motivated pupil activity, increased the learner's reception of factual information as well as promoted or strengthened his ability to understand causes and relationships.

Following this period, the advent of sound on film gave a rise to another cycle of experimental research. Beginning with the investigations of Frances Consitt, V. C. Arnspiger, C. C. Clark, Phillip Rulon, William Westfall, Harry Wise, John Elmore Hansen, and up to such recent studies as those of David Goodman and others, the sound film in its relation to infor-

mational learning as well as developmental thinking, in its relation to effective use of the silent film, and in its relation to effective and tried tradition classroom procedure, became the basis of much research. This period of study may be said to have observed the premise that sound films and silent films, when used in the classroom, must be valid; i. e. (1) they should present information which is specifically adapted to the technique of motion and sound, and (2) they should do a better job of presenting a given area of information than other media—slides, charts, textbooks, demonstrations, or lectures.

The researches conducted by the people just cited have stood the test of time, the repetition of techniques in closely allied subject-matter areas, and the examination and criticism of fellow research workers. The findings of these researches may be drawn upon as answer to the following questions:

(1) *Among what subject-matter areas have investigations been made relative to the effective classroom use of educational sound and silent films?* Studies have been conducted in the areas of the social studies, penmanship, physics, home economics, English, health education, current history, music, general science, biology, history, and college science. A large portion of the subject matter in the elementary, junior and senior high schools, and at the college level has been probed. In every case the advantage of the true edu-

cational sound and silent motion pictures has been demonstrated when they have been properly used and under conditions which warrant their use.

(2) *Has the educational silent film been proved a useful adjunct to classroom method?* The researches of Weber, Westfall, Rulon, Clark, Consitt, Wood and Freeman, Knowlton and Tilton, provided evidence to support the positive contribution to learning made by the silent film.

(3) *Has the educational sound film been proved a useful adjunct to classroom method?* Here, as in the

**I**N this first appearance of the new department in EDUCATIONAL SCREEN, Dr. Wittich offers a brief resume of past research and conclusions on the general functions of films in teaching. Regularly hereafter The Curriculum Clinic will be concerned chiefly with two aspects of audio-visual aids: (1) their proper integration with school curricula and (2) their effective utilization in the classroom.

It will be a Department of realia, not of theory and precept. Specific audio-visual materials of all kinds, for all subjects, at all grade levels, will be systematically considered and concrete programs developed for classroom procedure.

To this end closest possible collaboration with teachers throughout the country is earnestly desired and cordially invited. Many veterans, through years of visual teaching, have developed original methods for particular situations, unique solutions for special problems, that could be equally valuable in other classrooms. This Department should become a clearing house for such data. Questions, suggestions, criticisms, brief articles will be welcome at all times.

Address The Curriculum Clinic, THE EDUCATIONAL SCREEN, as the spirit moves.

CIRCLE 7-7100

case of the silent film, the educational sound film has conclusively been proved an asset to good classroom procedure. Such investigators as Wise, Eichel, Rulon, Clark and Arnspiger pointed out the advantage to immediate and retained learning in such subject areas as American history, safety education, general science, biological and physical science, natural science and music at elementary, high school, and college levels.

(4) *Is information learned via educational sound and silent motion-picture films retained more or less effectively than when learned through other methods of classroom instruction?* Experimental evidence advanced by Weber, Rulon, Arnspiger, Consitt, Hansen, Knowlton and Tilton, pointed to positive advantages made not only in the direction of learning and using information included in the films but more definitely to the retention of this information over long periods of time.

(5) *Are educational sound and silent motion-picture films used most effectively among children of low or high ability?* While there is evidence that films provide more benefit to the slow learner than to the fast, there is reason to believe that this reflects a situation in which the technique appeals so much to the slow learner that the enthusiasm with which he responds leads the observer to believe that this same degree of enthusiasm is not present among bright pupils. For this reason, subjective judgments may be misleading.

(6) *Do educational sound and silent motion-picture films stimulate general interest?* Westfall, Clark, Consitt, Knowlton and Tilton, Freeman, and the Middlesex group reported that the use of the films in their experimental studies conclusively motivated and promoted heightened interest.

(7) *What effect does the use of educational silent and sound motion-picture films have upon the voluntary reading that children do?* Antagonists to educational films once feared that the use of motion-picture films would make learning so easy that reading would become a de-emphasized opportunity for the assimilation of new information. Well-recognized authorities such as Consitt, Knowlton and Tilton, and more recently investigations carried on under the direction of the American Council on Education, Committee on Motion Pictures, pointed conclusively to the fact that viewing well-constructed educational motion pictures stimulates voluntary reading.

(8) *What age represents the threshold beyond which educational sound and silent motion-picture films can be effectively used?* Studies carried on at the elementary, high school, and college levels point to the effective use of films.

(9) *What is the contribution of the educational sound and silent motion-picture film in terms of factual learning which effects changes in the social living of children?* Originally research concerned itself largely with the amount of factual information which accrued to the viewer of films. So many excellent data have been accumulated that there can be little doubt that the educational silent and sound motion-picture films contribute tremendously to the learning of factual information. The influence of films in producing ability to think, to reason, and to lead the child toward

socially acceptable behavior is of still greater interest to the teacher and the administrator, however. Without doubt, a broad base of correct factual information is essential to building skill in deductive and inductive thinking which should, in turn, markedly affect social attitudes and conduct.

(10) *What effect does the educational sound and silent motion-picture film have upon the oral response of those who view them?* The studies undertaken by the Committee on Motion Pictures in Education of the American Council on Education which include the titles "Projecting Motion Pictures in the Classroom," "Motion Pictures in a Modern Curriculum," "Students Make Motion Pictures," and "A School Uses Motion Pictures" provide accounts of well-motivated, purposive, and socially desirable oral response resulting from viewing well-chosen motion pictures.

## A Meeting That Produced Results

EDWIN J. THOMAS  
Staff Writer, EDUCATIONAL SCREEN

**E**VERY once in awhile, just as you almost reach the conclusion that meetings of all sorts should be abolished, you attend one that revives your faith in the great democratic art of convening. The Iowa-Nebraska Audio-Visual Aids Institute, held under the auspices of the University of Omaha at Omaha, October 12th to 14th was such a meeting. It was attended by over 600 teachers and others interested in visual education.

The Omaha Institute was highlighted by the enthusiasm shown by the delegates and by the diversified agenda on audio-visual education presented. Of such vital importance were the sessions, that parents of the Dundee School in Omaha, Miss Gaynelle Fay, Principal, volunteered to instruct classes in order to give the teachers an opportunity to attend the Institute. Much of the success of the clinic was due to untiring efforts on the part of Charles Hoff, business officer of the University of Omaha and his committee in charge of arrangements. The entire three-day event ran smoothly and with remarkable coordination and cooperation. Although the program was tightly

offered by

**ENCYCLOPAEDIA  
BRITANNICA FILMS**

## Authenticity of Subject Matter Assured

Because the authenticity of all material presented is safeguarded by the collaboration of outstanding authorities and subject-matter specialists, Encyclopaedia Britannica Films offer educators the most authentic classroom film library ever produced to meet the demands of the school curriculum.

## Correct Film Selection Assured

To help you properly select Encyclopaedia Britannica Films for your school system, we prepare, without obligation, an Integration Study after duly analyzing your school syllabi or courses of instruction. With this individualized Integration Study before you, you can systematically build an Encyclopaedia Britannica Film Library to fit your courses of instruction.

## Proper Film Utilization Assured

When Encyclopaedia Britannica Films are introduced into your school system, our Film Utilization Service at once plays an important role. Highly trained teachers, selected for their comprehension of modern instructional problems, explain the techniques of using Encyclopaedia Britannica Films as an instrument for dynamic classroom instruction.

scheduled ample time was allowed for discussion of proposals by speakers.

Members of the Army, Navy, and private industry took a predominating part in the Thursday Institute which was opened with a survey on audio-visual education aids in private industry prior to World War II. Floyde Brooker, Director of War Aids in War Training, U. S. Office of Education, treated visual education from the industrial angle. "Visual Education the Navy Way" was presented by Lt. James Brown, Officer in Charge of Training at the Great Lakes Naval Training Station. He gave a comprehensive report on what the Navy is doing along this line. Of importance to the delegates were his suggestions as to how the Navy's experiences in visual education can be utilized by the teaching profession in the postwar era.

Of unusual importance to educators were the pointed remarks of Bruce Findlay, Director of Audio-Visual Education in the Los Angeles schools. Mr. Findlay pulled no punches. He decried the tendency of teachers to accept ill-conceived and useless materials and urged them to demand films and other visual materials that were tailor-made for instructional purposes, and which made vital use of the regular laws of learning. He cited numerous illustrations, from the experiences of the Los Angeles Schools, of visual materials that were so designed as to incorporate direct teaching principles into the film, or filmstrip, or other instructional material.

The Thursday evening session in the University of Omaha auditorium was devoted to the topic of "FM Radio in Education" discussed in detail by Dean Douglass, Regional Director of the Education Department of the Radio Corporation of America. His address outlined the advantages of "FM", the availability of special bands for educational networks, and was followed by a demonstration of two-way FM broadcasting by members of the conference who were taken for a ride in the Sheriff's cars.

Paving the way for the Friday sessions, and as a preliminary to the actual school demonstration work, Dr. Walter Wittich, Acting Director of the Bureau of Visual Education of the University of Wisconsin, gave a general picture of problems connected with classroom utilization of audio-visual aids. Dr. Wittich showed examples of the various types of teaching films. This was followed by three classroom demonstrations using films with elementary, high school and college groups. Dr. V. C. Arnspiger, long identified with the audio-visual education movement and Vice-President of Encyclopaedia Britannica Films, Inc., completed the Friday lectures with a talk on "Approaching Social Competency Via the Sound Films." A forum discussion on "Educational Implications of Sponsored and Quasi-Educational Films Development" occupied the attention of those attending the Friday evening dinner session. The pros and cons of this delicate question were debated by men and women having interests and feelings on both sides of the problem.

Morning sessions, of the final day, included classroom demonstrations of the "Physical Sciences" and classroom utilization of teaching aids. Pupils of various

# Screens Especially Designed For School Needs

## To Meet the Requirements of Every Type of Visual Aid Program

The new line of modern Radiant Screens, incorporating many new and special features, includes Wall Screens, Wall and Ceiling Screens, Table Screens as well as the Portable Metal Tripod Screen ranging in size from 20" x 30" to 20 feet x 20 feet and larger. These screens are sturdy, long-lived—easy to operate and they are available with the improved Radiant "Hy-Flect" Glass Beaded Surface that permits the projection of visual aids with greatly increased brilliance, clarity and contrast. Today—thousands of schools, universities, institutions, and government agencies use and endorse Radiant Screens.

### Radiant Portable Models Offer You:

In addition to the "Hy-Flect" Glass Beaded Screen Surface—you will find many special conveniences and unique advantages in Radiant Tripod Screens. These include:

1. **Automatic Clutch.** A positive device that permits instant raising and lowering of screen housing without the necessity of manipulating screws and bolts. So simple and easy to operate a child can use it.
2. **Quick Tripod Release.** Tripod legs may be opened and closed quickly. They

support the screen in *any* position for wide or narrow spread without set screws or plungers.

3. **Auto-Lock.** (Pat. applied for.) Just touch convenient button for raising or lowering center extension rod and screen instantly.

4. **Convertible from Square to Ob-long**—for movies, stills or slides, Radiant square sized screens are convertible to oblong by merely raising screen to indicated position.

The Radiant Screen here illustrated is Model DS—a portable Metal Tripod Screen—sturdy but light, compact, easily set-up, quickly adjustable. Available in sizes from 30" x 40" to 52" x 72".

age groups participated. Throughout the teaching aids lecture various forms and types of slides, strip film, maps, globes, recordings and radio were employed. The closing clinic was in the nature of a panel reviewing the subject matter covered by the Institute and the presentation of recommendations based on the accomplishments of the sessions.

Included in the recommendations were suggestions that teacher-training institutions and school systems should provide in their programs of pre-service and in-service education much needed training and experience

in the use of audio-visual aids. Superintendents of schools should stress to their boards of education the need of these aids and suggest adequate school budgets be set up for the purchase and upkeep of such instructional aids. Teachers must learn to select the exact audio-visual aids for the specific teaching job in hand. Audio-visual aids should be kept readily available to teachers and responsibility for getting these aids used should be assigned to a committee. The panel also recommended strongly that the University of Omaha make provision for another Institute to be held next year.

Mr. Hoff reports that Dr. Rowland Haynes, President of the University, has requested him to prepare a plan for the utilization of audio-visual educational aids to a greater extent at the school, and that the State Department of Education has also appointed special committees to accelerate the activity and also to study the feasibility of a state-wide FM network.

### Du Mont's New Television Studio

Du Mont Television Station WABD in New York has expanded its facilities by adding to its original studio on the 42nd floor of 515 Madison Ave., a new large studio, two reviewing rooms, a theater with projected screen images, general offices, dressing rooms, prop room and other accommodations. A sales department for television equipment will be on the third floor.

# SCHOOL MADE MOTION PICTURES

HARDY R. FINCH, Editor  
Head of the English Department  
Greenwich High School, Greenwich, Conn.

*With a question box on the making of  
school film productions, conducted by*  
**DAVID SCHNEIDER**  
Evander Childs High School, New York City

**W**HEN the history of the home front activities of this World War is written, school-made films will be examined, especially the Lincoln (Neb.) High School film on its Victory Corps activities. One of the advisors of the Lincoln film production group, Miss Elizabeth Grone, has written the account presented below.

## School Film Victory Corps Activities

**L**INCOLN HIGH SCHOOL'S Victory Corps film began very modestly, almost accidentally, when a public spirited citizen loaned a 16mm. motion picture camera to the camera club sponsor and when, almost simultaneously, a Lincoln photographic firm offered at a bargain Kodachrome film just beyond the expiration date. The Lincoln high school camera club purchased 100 feet of 16mm. indoor Kodachrome from their ten-cents-a-semester dues and appointed a committee to work on a script.

The Victory Corps was then the newest, the most timely, and probably the most active organization in the school, and since, in addition, the nature and variety of its activities offered exciting photographic possibilities, the group unanimously decided to depict the work of the Victory Corps. Then followed conferences with the Victory Corps sponsor and members. After the scenes were selected, a student in the creative writing class wrote the script. A camera club member with artistic ability made a colorful title using red and blue showcard paint on a cream color texture wall paper.

The original 4½ minute film opened with a shot of a large group of pupils coming out of the main

entrance of the school followed by a closeup showing the Victory Corps armbands they were wearing. Using the theme of "not mere armband wearers these" the next scenes featured Red Cross work of Victory Corps members: boys in the carpentry shop sanding model airplanes and packing them, and working on an adjustable leg splint; and girls sewing on bed jackets for the air base hospital. Planned to illustrate the close cooperation between the school and the community in war work, the next two scenes depicted pupils doing filing at the City Hall and others assisting at the city hospital. The final shot was of pupils placing their scrap metal in a large container.

The chief problem was to get enough light for inside pictures without blowing fuses. A large reflector with a No. 4 photoflood and a small reflector with a No. 2 bulb were used. A Weston meter reading was taken on a medium shade tan paper envelope; usually the lights had to be placed as close as possible to the subject and the camera opened up to f. 3.2 or f. 2.8. Student photographers had viewed enough amateur motion pictures so that they were glad to use a tripod. The tripod insisted upon slipping on the floor until it was shod with rubber caps normally used for crutches. For outdoor shots a Leica filter was fitted in with toothpicks or matches.

The first scenes were not taken by the students, but several club members were on hand to rig up lights, help pose the groups, and get first-hand information on how to manipulate the camera. Afterward these boys served as cameramen and other assistants were worked in. Upon some occasions no sponsor was present. The usual procedure was to explain from the script the action desired and to run through it once or twice while both students and sponsors tried to visualize how it would look. The cameraman followed the action through the viewer, and another pupil checked for time. Some attempt was made to consider whether pupils were photogenic, but in the main the pupils who had done the most work were featured.

The 100 feet came to an end all too soon. Sponsors and pupils both felt that the film was too short but an exciting and valuable experience. The film was so well received that the school board offered to buy as much Kodachrome as would be needed to take a complete picture of the work of the Victory Corps. The finished film was close to 500 feet long, and took about twenty minutes running time.

The informal organization was not adequate for this extended activity. A joint committee of Victory Corps and camera club members; the camera club

"Shooting" a group of students studying global geography.

sponsors, Miss Elizabeth Grone and Julius D. Young; and the Victory Corps sponsor, Miss Mildred Kemp, met with the principal, H. C. Mardis, to outline the film. It was decided to insert captions. White metal letters were placed on a background of the wine grained leather binding of a college annual. A strong side lighting was used so that the shadows might give depth to the letters. The book was laid flat and the camera placed above it.

The film opened with the words *Know Your Victory Corps* followed by successive closeups of the six Victory Corps insignia. It presented the three-fold program of the Victory Corps: physical fitness, which included shots of physical examinations, physical education classes, pre-induction groups using the army obstacle course, hygiene classes, rest groups, nutrition, and first aid; vocational training, comprising global geography, military swimming, plane identification, automobile shop work, and the Morse code; and finally community service, which in addition to most of the material in the first film included a scene on child care for which home economics students arranged a pleasant living room setting at school and a patron brought a model baby.

Pictorially outstanding were the shots of the obstacle course, which is located in a city park near a small stream. The gay yellow of the autumn leaves, combined with the lively action of the skilled and unskilled following the rigorous army course, made these scenes unusual. The closeups of a doctor probing into a pupil's mouth, of hands tapping out the Morse code, and of automobile engines running were also very successful.

The picture closed with (and this was the suggestion of a Victory Corps member) a word-picture summary: *Victory Corps Members Are Physically Fit* and a flash from a physical education class; *Vocationally Trained* and a flash from the school print shop; and *Willing To Serve* followed by the colorful red-and-white-uniformed high school band marching with the flag.

During the annual open house for parents the film was run continuously in the auditorium. It was also shown for a Victory Corps school assembly as well as for civic groups.

In concluding her account, Miss Grone lists the following as outcomes of the film:

1. Most obviously it gave camera club members a valuable photographic experience.
2. It offered an excellent opportunity for coordinating the work of the camera club and of the Victory Corps and furnished occasions for working with practically every department in the school and even with patrons and city officials.
3. The film intensified student interest in the Victory Corps and gave an impetus to the school's war effort.
4. The film brought the school's war activities before the community.

(Concluded on page 400)

# ENTERTAINMENT

with

## Educational Overtones

Fascinate school audiences with historically and sociologically significant POST PICTURES' 16mm Sound Films. You achieve a two-fold purpose: provide entertainment at its delightful best, and give background to classroom teaching. Choose from such fascinating film fare as:

## QUESTION BOX ON FILM PRODUCTION

**QUESTION:** We're planning to run some 16mm. films we took of our school activities. In order to publicize the coming show we would like to include on our posters some stills taken from our movies the way the professional producers do. What procedures do you recommend for getting those enlargements? Please advise.

**ANSWER:** In the first place, let's correct a common erroneous impression. Professional producers rarely make enlargements of their movie frames for publicity purposes. They take regular stills of any scenes they expect to use for posters or for the press. These pictures are posed for at the time the cast is assembled for the various film sequences.

In your own case it's important to know that no two frames of any movie sequence, especially of a scene portraying action, are of equal sharpness. It is, therefore important to run your film through an editing machine or projector and select those scenes that you want to have enlarged. Anywhere along the footage of each of these scenes you may find a frame portraying a close-up of pleasing composition, of good contrast in color or light and shade, and above all, of a high degree of sharpness. An ordinary hand lens, or if that is not available, your one inch movie camera lens, if removable, can be used to verify the acuity of your naked-eye judgment. The frames that meet these specifications usually make the best enlargements. These frames need not be removed from the reel of film to obtain the stills. They can be identified by a small nick along the edges or by a piece of cotton tied to one of their perforations.

To make your own enlargements you must have either the special 16mm. enlarger built for that purpose, or the standard enlarger found in any darkroom. The special 16mm. enlarger (manufactured by Eastman Kodak) takes the standard spooled film, No. 616, containing eight exposures 2½ x 4¼ inches. When using that enlarger be sure to follow closely the directions given by the manufacturer. To these directions I would like to add the importance of getting acquainted with the lever that operates the shutter. Not a few beginners make the mistake of closing the shutter at the time they think they expose the frame to the light. To avoid this waste of film and effort, open the back of the unloaded enlarger, and experiment with the lever to get the feeling of its tension. You will note that no matter what the position of the lever, as long as there is no tension on it, the shutter remains open.

After making the eight exposures it is advisable to develop that roll of film in a fine grain developer, such as DK 20. This will permit, in addition to the excellent contact prints of 2⅜ x 3¼ inches, further enlargements, even up to 8 x 10 inches, depending, of course on the sharpness of the original frame.

In using the regular darkroom enlarger it is essential to cover up all escaping light, excepting that which has to be concentrated on the 16mm. frame. A black cloth, thrown over the top of the enlarger will shut off any light escaping through the air vents. A black paper mask for the negative holder, with its central area cut out to fit the size of the picture area of the 16mm. frame will complete the necessary black-out. A little experimenting with a piece of cut film is now necessary to determine the length of the exposure. Remember to use the smallest lens opening for best results. With orthochromatic film all this work may go on with the aid of a safelight.

Of course, if neither piece of enlarging equipment is within your reach, your local camera dealer will be only too glad to handle this job for you—at prices ranging between seventy-five cents to over a dollar per picture.

## Illinois School Boards Discuss Visual Education

For the first time in its thirty years of annual meetings, the Illinois Association of School Boards featured a visual education program on its agenda. Meeting jointly with the Illinois City Superintendents' Association, in the Abraham Lincoln Hotel, in Springfield, on October 23, the entire first evening, following a brief business session, was given over to a panel discussion on "Can Our Schools Afford to Teach the G. I. Way?"

Panel members included Floyde E. Brooker and J. Stanley McIntosh of the U. S. Office of Education, Lt. James E. Brown (USNR), Dr. Stephen M. Corey (University of Chicago), Ernest C. Waggoner (Elgin High School), and Orville T. Bright (Lake Bluff Superintendent). Vernon L. Nickell, State Superintendent of Public Instruction was drafted as an additional unannounced member, and evoked great enthusiasm when he declared:

"To me it is not a question of whether we can or cannot afford visual aids to increase the effectiveness of instruction. We simply cannot afford to go without them. We can get the funds somewhere. Each of us can add to our budget. I don't proclaim that we can reduce the period of instruction by more than 40 per cent. That may be necessary in time of war, when training men for particular jobs. But in the classroom our objective should be to make our teaching more effective. We know that this can be done by means of visual aids—and we know that it must be done".

Chairman of the panel, William F. Kruse, Manager

of Bell & Howell's Films Division, illustrated the program with four sound films, produced by the USOE, Navy, Air Force and Army, respectively, and with one SVE Airforce filmstrip. Lt. Brown presented about a dozen 2 x 2 slides showing as many varied visual teaching aids, and Mr. Waggoner offered as a typical classroom film, an Erpi subject that had already been

run 1561 times. He stressed the economy of visual aids and showed the entire film program on a projector which he announced he had bought in 1934 and had been using daily except for two factory service trips in ten years. A record audience packed the Grand Ballroom, a wide corridor, and another ballroom beyond. The Sixth War Loan short, "Silence", was especially effective in this, its premiere showing in the state.

# The Literature in Visual Instruction

## A Monthly Digest

ETTA SCHNEIDER RESS, Editor

### UTILIZATION

- **Education: The Army (G. I.) Way**—Irwin A. Eckhauser, Mt. Vernon Public Schools, New York (now with the Army Air Forces)—*Social Studies* 35:262 October, 1944.

The methods that have been found successful in the armed forces should be applied in postwar education, especially to accelerate the teaching of unusually bright pupils.

Of all teaching devices the Army-Navy-Air Force does not favor is the classroom lecture. The use of visual aids is more favored. From a twenty-minute film trainees have learned more than from a two-to-three hours' lecture.

How will this procedure be applied in the education of young people? Before any film or any visual aid is used, there must be the reason for its use or study. Certainly looking at a film without knowing what you are looking for is aimless, useless and pointless. Films are not and should not be used as substitutes for mental toil and sweat.

In the years to follow, teachers will have access to stirring documents of the current war that will be a real and breath-taking experience for the learners. Through the use of films it is possible to utilize the talents of skilled specialists that the school could not afford. It is possible through films to clarify subject matter usually too difficult to explain.

The use of comprehensive aptitude tests has also been greatly improved in the Army and Navy. Selectees are given specialized training to suit their particular aptitudes. This might be applied in postwar guidance of young people, so that training and cultural education may be given that would make best use of the individual's talents. This planning of education to revitalize our public schools should begin now.

- **The Educational Motion Picture and the Filmstrip as Tools of Learning**—M. R. Brunstetter, Teachers College, Columbia University—*School Executive*, 64:63 September, 1944.

A few principles underlying the use of the motion picture and filmstrip are stated and amplified:

(a) These materials must be taught, not merely presented. Teachers must be trained in the techniques of their use, alert to develop creative procedures. The showing of a film or filmstrip is not an aid to learning but is rather an experience, full of the interest and stimulation that accompanies any meaningful learning experience.

(b) The school should require high standards of production. This means awareness of the possibilities of the media, realization of new curriculum needs, and systematic procedures of evaluation.

(c) Local arrangements for securing and showing films and filmstrips should be such that the teacher does not hesitate to plan their use. It should be easy for the teacher

to present these materials at the time when the interest of the students dictates it.

The motion picture has its advantages and limitations, and it becomes necessary therefore, to use complementary materials. The filmstrip is such a device, whose usefulness results from three factors: projection of a number of selected photographs dealing with one general topic; opportunity for detailed study, and convenience of handling. Methods of preparation and presentation resemble those of other audio-visual aids.

### ADMINISTRATION

- **Organizing and Administering the Audio-Visual Aids Program**—Virgil M. Rogers, Supt. of Schools, River Forest, Illinois—*School Executive* 64:56, September, 1944.

Planning for postwar use of audio-visual aids must be done now. This includes a budget appropriation adequate for a sound projector for every 15 or 20 classrooms, or in each building. A radio in each classroom and similar facilities should be planned. There should be one person to administer the program, either part time or full time. Cooperating with this director should be the Teacher Committees. Appropriate source materials should be on hand.

These plans are necessary to put into practice many of the new techniques that returning service men have learned.

### STATUS

- **Tools for Learning**—E. R. Van Kleeck, Assistant Commissioner of Education—*New York State Education* 32:37 October, 1944.

This article introduces a series featuring audio and visual aids, library services, and testing. Next month Dr. Ward C. Bowen, chief, Bureau of Radio and Visual Aids, will discuss visual aids in the elementary school.

Tools for learning in this article include all of the experiences that add to knowledge and improved living. Pageants, dramatizations, youth canteens, civic youth clubs, play schools are some of the "tools". Community resources, as outlined in Palmer's Cornell University leaflets; the intermediate course of studies in social studies, stressing our global world; and the various audio-visual materials are such tools. Achievement tests, and all the tests of pupil aptitude and ability are tools to help the teacher.

New applications of such devices as charts, exhibits and comic strips for semi-literates in the army have implications for use in schools. Instruction under the Army's intensive program has speeded up certain kinds of learning and has weeded out a good deal of dead curricular material. But this pace should not be emulated in peacetime education.

- **What About G. I. Education?**—E. T. Peterson, Dean, College of Education, University of Iowa—*Midland Schools* 59:44 October, 1944.

In reviewing the results of the extensive educational program of the armed forces, several basic conclusions appear that all educators should recognize and apply: (1) that education has been given unusual recognition; (2) that the millions of men and women undergoing training are under the supervision of professional educators; (3) that the wartime training program, unlike peacetime education, has specific, concrete objectives; (4) that motivation is intense, direct, functional; (5) that learning procedures are recognized and applied, not invented or improvised; (6) that teaching aids are carefully and properly used—effective learning has received the help it needs from motion pictures, filmstrips and many other devices; and (7) that there has resulted genuine cooperation and coordination between

### Correction

It is learned that the publication, "Nontheatrical Films: A Handbook for OWI Outpost Officers," reviewed in the September issue of this department, is restricted exclusively to the use of U. S. Government personnel overseas and is not for public distribution either here or abroad. As a result of the review, there have been a number of requests for copies of the Handbook from our readers.

*Editor's Remark:* Please note proof that some people actually do read the department.

## Put Your Projector to Work For the SIXTH WAR LOAN!

An inspiring presentation of the American way of life . . . portraying the hopes of the immigrant upon approaching our shores, his aspirations and his contributions to our culture. Beautifully photographed . . . significant . . . a MUST for school audiences. Available for rental and sale.

### The Story Of The VATICAN

The inside story of the smallest Sovereign State with scenes of places usually barred to visitors. Shows work of Michelangelo in the Sistine Chapel, basilica of St. Peters, Vatican library, burial crypts, operation of civil government. 6 reels, 16mm. Sound.

### OUR BLESSED LADY (Cathedral of Notre Dame)

Traces the history of the Cathedral of Notre Dame in Paris during the past six centuries, witnessing the rise and fall of France down to its liberation from German occupation. Shows Notre Dame's architectural wonders, priceless jewels and relics. 6 reels, 16mm. Sound.

The U. S. Treasury Dept.—War Finance Division—has made available for the 6th War Loan drive a group of 16mm motion pictures produced by the Navy and War Depts. Projectors and operators are needed. Contact your local War Finance Committee—at once!

industrial, government and educational leadership in the production, distribution and utilization of teacher aids.

The challenge to educators lies in making use of those materials that will be pertinent in postwar education. But what is more important, is that we proceed to make use of the techniques learned in war. Only as educators realize the significance of teaching aids in postwar education, can or will they proceed to unlock the doors of adequate financial support, continued utilization of war-trained personnel, and effective cooperation with the industry.

As a first step two publications are urgently recommended to all in education and in the audio-visual industry: (a) "Education of All American Youth" by the Educational Policies Commission, NEA; and (b) "More Learning in Less Time" by the United States Navy.

### INTERNATIONAL UNDERSTANDING

- **Films Make Good Neighbors**—J. Margaret Carter, National Film Board of Canada—*School Executive*, 64: 39-41 September, 1944.

The Canadian Government is using documentary films to weld the peoples of Canada and her fighting allies to positive international thinking. These films are built around a pattern of thought, interpreting the events of the day in terms of developments of the past, and, in turn, relating past and present to the future.

The Canadian Film Board releases one film each month in two major series, "World in Action" and "Canada Carries On." These are all shown in theatres as well as to non-theatrical audiences. Another group of films is produced for 16mm use and distributed free to war plants, trade unions and rural groups, as well as to schools, clubs and churches. Many of the "World in Action" films and the non-theatrical releases are available in the U. S. These subjects serve to bring information on mutually interesting subjects to American audiences, but they also are building up excellent understanding of the Canadian people.

A fleet of 70 mobile units brings a regular film program each month to outlying sections. There are foreign language sound tracks for audiences of various cultural backgrounds. Film forums are being promoted by the rural university extension groups. War workers are reached by an integrated method whereby 40 projectionists tour the cities and shipyards.

### PHOTOGRAPHY

- **Photography in the Elementary School**—Lela Van Engen, University of Wyoming—*School Science and Mathematics* 44:612, October, 1944.

The methods and facts which grew out of a unit on photography in a fourth grade class at the University Elementary School shows that young children can learn a great deal and will probably develop an on-going interest in photography as a hobby.

The children used an inexpensive camera and learned the various parts and their uses. They learned how to load the camera, how to focus, how to compose a good picture, when and how the light should fall. They learned the difference between N. C. film, orthochromatic and panchromatic. They were given an opportunity to develop, print and finish their photographs.

### RADIO

- **Radio and the Education Program of the Future**—Floyd E. Henrickson, New York State College for Teachers—*School Executive* 64:66 September, 1944.

Among the necessary pieces of equipment that will be needed to make best use of the radio are a recording machine to capture programs for later use and good receiving sets. Among the future possibilities of radio are as a means of educating on an international basis; and as a weapon to strengthen the cause of truth. But there must be training for radio listening, to enable our people to discriminate between truth and falsehood.

## EFLA Annual Report

The spectacular rise of the Educational Film Library Association from a temporary committee to a permanent organization is clearly indicated in the annual report of the association submitted to the board of directors by L. C. Larson, chairman. From a mere attendance of 11 leading film lending librarians in 1942 over 500 participated in the 1944 meeting held this summer in Chicago, in connection with the Sixth Midwestern Forum on Visual Teaching Aids.

The Association was incorporated two years ago to assist various government agencies in the distribution and utilization of 16mm films to further the war effort. Since that time, it has embarked on a comprehensive program in behalf of the distribution and utilization of audio-visual aids through educational film libraries. That program is now leading to a number of additional services and projects, as indicated by the ten major sections of Mr. Larson's report, as follows: (1) Formation of the Educational Film Library Association; 2. Relations with Government Agencies; 3. Production of Films for Educational Use; 4. Marketing of Films; 5. Distribution and Utilization; 6. Professional Education and Training of Teachers; 7. Research; 8. Publications; 9. Revision of Constitution and By-Laws; 10. Financial Support of Association's Activities.

Much of the association's work throughout the past year was directed towards establishing smooth working arrangements between film libraries and government agencies especially in instances where charges of discriminations were made.

A survey was also made of the number of 16mm films available for educational purposes and the number needed to carry out effective work in this direction. It is estimated approximately 25,000 film subjects are essential for all purposes. The number of queries received from sources ranging from producers to consumers qualified the association as a much needed adjunct to audio visual education and opened many new channels of usefulness to the group. Included in the inquiries were those from industrial sponsors, foundations and educational institutions regarding films needed in all areas of education.

Of major importance, according to Mr. Larson's report, is the necessity of discovering some method to keep films moving freely from producer, to distributor, to consumer as well as the opening of new markets for educational films. During the past year the Association has cooperated with producers and distributors in marketing outstanding films of general interest. Plans are underway also whereby the Association will perform a clearing house function for educationally produced films.

The ability to assist film users in the selection of proper films, by supplying them with correct film information and evaluation, was also enumerated as being of vital importance to the success of the Association. Such a font of data would go a long way in the proper handling of audio-visual educational programs.

# otes

Also necessary in the carrying out of a program for the advancement of audio-visual education is attention to the recruitment, training and placement of professional workers in the field. This is especially true in view of the tremendous interest aroused in visual education by the training programs inaugurated by the armed services. The need for research, in the opinion of the director, will also play an important role in forwarding visual education.

The appointment of various committees to study and deal with the various problems outlined, was recommended by Mr. Larson. Other matters reported upon pertained to routine matters of the organization.

## Commission on Motion Pictures Evolving New Geography Course

The Commission on Motion Pictures in Education of the American Council on Education, which is now under the direction of Gardner L. Hart, is working with Dr. Wallace Atwood of Clark University and Dr. F. Dean McClusky of the Scarborough School (New York) on a new course in geography for secondary schools. This course is designed to meet some of the needs in modern geography in the postwar period, and is called "Widening Our Horizon." What type of visual materials should be used in the various units of the course, is now under study.

The Commission has adopted the following procedure for carrying out the purpose for which it was formed, namely, to plan for the production of films in fields of study where new educational films are needed. After the group has outlined the various fields in which research is to be done, a group of specialists in the particular field being studied are engaged to work out a program and suggest where visual materials may make a contribution. An expert in that particular field is then employed to actually work out the suggested subject matter. This is then evaluated by the Commission and by a group of curriculum experts. The outlines are revised in line with suggestions that are received. The scenarios are then written, after which it is planned to submit these to a group of leaders in the field of audio-visual instruction. After receiving their suggestions, the scripts are then revised and made available to producers.

## Audio-Visual Aids Conferences

An Audio-Visual Aids Conference sponsored by the schools of Southwestern Washington and the State College of Washington was held in Kelso, October 6 and 7. Among the topics for discussion on Friday were: "Why I Use Films to Teach Biology," "In-Service Training and Visual Instruction," "Post War Trends in Visual Equipment," "Personalizing Your Visual Education Program," "What Can the Schools Learn from the Navy's Visual Training Program."

A Group of Fact Films Dealing With Subjects in the Public Interest, For Use in Film Forums, Discussion Groups, Classrooms, Adult Education Centers, Industrial and Farm Organizations.—

16mm Soundfilms For Rent and Sale

*Produced by the National Film Board of Canada*

### THE LABOR FRONT

21 Minutes Rental \$3.00 Sale \$72.00

The immense job free labor has done along with all sectors of the population in the global war against the Axis. The new responsibilities of Labor and the new attitudes toward it. Will the post-war bring unemployment and insecurity or will we treasure the greatest asset a nation can have—the living force of its people?

### PARTNERS IN PRODUCTION

28 Minutes Rental \$1.00 Sale \$45.00

Using a problem of readjustment at a north country coal mine as an example, this film outlines the story of Joint Production Committees in wartime Britain. An authentic picture of Labor and Management in collaboration, and a striking portrayal of democracy at work. Cooperation for war production provide a background for peacetime.

### A MAN AND HIS JOB

17 Minutes Rental \$3.00 Sale \$50.00

The problem of unemployment traced in story form from depression years of the twenties to the present time. Deals with the insecurity of the early period; the rise of Unemployment Insurance; planned manpower employment in wartime Canada. Stimulates discussion and study of problem of avoiding mass unemployment at the end of this war.

### THE PEOPLE'S BANK

20 Minutes Rental \$3.00 Sale \$50.00

Story of the purpose and growth of Credit Unions in fishing, mining, farming, and industrial communities and settlements. Set in Quebec, New Brunswick, Nova Scotia, Manitoba, and Saskatchewan; with farm and town families taking part to show how this form of community cooperation has helped solve emergency problems and local business enterprise.

**SOUTHERN VISUAL**  
492 South Second St. MEMPHIS 2, TENN.

The Saturday morning session was devoted to grade and high school class demonstrations of classroom use of visual materials.

Among the section meetings on the program of the 1944 Convention of the Minnesota Education Association in St. Paul last month, was one on Audio-Visual Aids the afternoon of October 26. Mrs. Marion W. Smith presided over the session, the theme of which was "The Unique Contribution of Audio-Visual Aids to Effective Instruction." Mr. Paul Wendt, University of Minnesota, told of "Recent Developments in Visual Aids," and Major Keith South, Fort Snelling, described "The Use of Visual Aids in War Training and Pre-Induction Programs." A discussion period followed the addresses, with small discussion groups working under leaders.

**Chicago Film Workshop in Adult Education**

For many years the educational, social and industrial organizations interested in the use of film as a media of education have indicated a need for a clearing house service which would provide assistance in the selection of films on special problems, previewing of films, information on film sources and training in the use of the film. To fulfill this need, the Adult Education Council, with the cooperation of the several agencies listed, is pleased to announce the Chicago Film Workshop Program.

Previews of films and demonstrations of techniques in their use will be held in the Chicago Board of Education Conference Room, 228 N. LaSalle Street, twice each month. The first session was held Friday afternoon, November 10; the next one will meet November 24 at 3:00 P.M. From time to time discussion leaders experienced in the use of films with adult groups will be invited to give demonstrations.

Films screened at the first meeting were: *Portugal*, the first in the new 16mm March of Time "forum editions; *Global Air Routes*, a National Film Board of Canada production; *Tyneside Story*, produced by Brit-

ish Information Services; and *The Bridge*, a film on South America, produced by the Foreign Policy Association and distributed by the Coordinator of Inter-American Affairs.

Members of the Committee are: J. Margaret Carter, National Film Board of Canada; Mildred L. Batchelder, American Library Association; Alice H. Farquhar, Chicago Public Library; John L. Hamilton, British Information Services; Cyril Houle, University of Chicago; Lee R. Robins, Chicago Board of Education, and Ralph McCallister, Adult Education Council.

**State Department Reorganizes Film Division**

The motion picture and radio division of the U. S. State Department has been reorganized and expanded, and given the new name of International Information Division. John M. Begg continues to head the division, which previously was designated to act only as liaison between the department and other agencies in the dissemination abroad of information regarding the war effort, and in the development of cultural programs through the media of motion pictures and the radio.

The expanded division will formulate the policy of the department regarding the role and scope of official overseas information programs and projects of the Government in the conduct of United States foreign relations; will develop such programs by means of films, radio and publications; will cooperate with officials of other agencies, particularly war agencies, such as the OWI and the CIAA, in planning overseas information programs; and will participate in intergovernmental committees and in international conferences concerned with the content and informational use of international informational media.

The new charter permits the international information division to take over the non-theatrical motion picture activities of the Office of Coordinator of Inter-American Affairs, if that is decided upon at the expiration of the CIAA budget in June 1945, as well as the informational work of other war agencies on their dissolution.

# YOUR STORY ON FILM

Do you have a sales message or a progress story to relate . . . are you looking for a *simplified* method of teaching your personnel to do a better job?

We are specialists in "made-to-order" films to your specifications . . . that tell a retentive story, easily and quickly. Our spacious, fully equipped sound studio and top-notch craftsmen assure "professional" caliber films. Where necessary, crews and equipment, are placed at your disposal.

### Introduction to the Army

(Film Review)

*Introduction to the Army*, a new 40-minute Army Training Film, is now available to schools for showing to students faced with induction into the Army. It was prepared largely at the request of educators desiring some effective means of preparing their students for the adjustments they must make to Army life. The film shows what happens to Johnny Jones, a typical 18 year old, from the time he receives his "Greetings" from the President until he completes his basic training. He is seen getting examined, sworn in and classified, taking physical and mental examinations, being fingerprinted, taking shots, getting his GI uniform, being interviewed.

It shows him doing the Army's "dirty work"—making beds, policing company streets, doing K.P.; learning to be a soldier, drilling, digging a fox hole, reading a military map, administering first aid, firing a rifle, performing under simulated battle conditions; getting his recreations—through the USO, Post Exchange, dances, sports and shows; being cared for by the Army—through the Red Cross, the Chaplain, Personal Affairs Officer, and Company Commander; medical and dental service; Army insurance, and family pay allotments.

The picture does not attempt to glamorize Army life, nor to make it ridiculous. It simply attempts to show the potential inductee what is likely to happen to him after he enters the Army; to answer questions which have been vexing him about Army Procedures; to show him why things have to be done the "Army Way"; to dispel any ideas he may have that Army life is a "lark" but to reassure him that it is not so tough that he can't take it.

Schools may obtain information concerning availability of the film (TF 21-2067) from the Pre-Induction Training Officer in their Service Command headquarters.

STATEMENT OF OWNERSHIP, MANAGEMENT, CIRCULATION, ETC., REQUIRED BY THE ACT OF CONGRESS OF AUGUST 24, 1912 Of The Educational Screen, published monthly except July and August, at Pontiac, Ill., for October 1, 1944, State of Illinois, County of Cook, as

Before me, a notary public in and for the State and county aforesaid, personally appeared Donald P. Bean, who, having been duly sworn according to law, deposes and says that he is the publisher of The Educational Screen, and that the following is, to the best of his knowledge and belief, a true statement of the ownership, management (and if a daily paper, the circulation), etc., of the aforesaid publication for the date shown in above caption, required by the Act of August 24, 1912, as amended by act of March 3, 1933, embodied in section 537, Postal Laws and Regulations, printed on the reverse of this form, to-wit

1. That the names and addresses of the publisher, editor, managing editor, and business managers are: Publisher, Donald P. Bean, 64 East Lake St., Chicago, Ill.; Editor, Nelson L. Greene, 64 East Lake St., Chicago, Ill.; Managing Editor, Nelson L. Greene; Business Manager, Donald P. Bean.

2. That the owner is: The Educational Screen, Inc., 64 E. Lake Street, Chicago, Ill. Donald P. Bean, 75 E. Monroe St., Chicago, Ill.; Nelson L. Greene, 5836 Stony Island Ave., Chicago; Marguerite Orndorff, 7022 Warwick Rd., Indianapolis, Ind.; Marie Craig, Bangor, Me.; Estate of J. J. Weber, Bay City, Texas.

3. That the known bondholders, mortgagees, and other security holders owning or holding 1 per cent or more of total amounts of bonds, mortgages, or other securities are: (If there are none, so state.) None.

4. That the two paragraphs next above, giving the names of the owners, stockholders, and security holders, if any, contain not only the list of stockholders and security holders as they appear upon the books of the company but also, in cases where the stockholder or security holder appears upon the books of the company as trustee or in any other fiduciary relation, the name of the person or corporation for whom such trustee is acting, is given; also that the said two paragraphs contain statements embracing affiant's full knowledge and belief as to the circumstances and conditions under which stockholders and security holders who do not appear upon the books of the company as trustees, hold stock and securities in a capacity other than that of a bona fide owner; and this affiant has no reason to believe that any other person, association or corporation has any interest, direct or indirect, in the said stock, bonds, or other securities than as so stated by him.

DONALD P. BEAN, Publisher.

Sworn to and subscribed before me this 30th day of September, 1944.

JOSEPHINE HOFFMAN,

Notary Public.

(My commission expires June 21, 1945.)

# Current Film News

■ **BRANDON FILMS, INC.**, 1600 Broadway, New York 19, have contracted for the United States distribution of a new group of *Public Affairs Films* produced by the National Film Board of Canada. "Transition to peace" and "postwar planning problems" are the subjects of the pictures, which comprise a first group of four productions entitled:

**A Man and His Job**—which traces the problem of unemployment from the depression years of the twenties to the present time. It shows the rise and functioning of Unemployment Insurance.

**The People's Bank**—a description of the growth of Credit Unions in fishing, mining, farming and industrial communities and settlements of Canada. Farm and town families take part to show how this form of community cooperation has helped to solve emergency problems and local business management.

**The Labor Front**—the great dramatic story of the mobilization of free people to produce for victory. The overwhelming facts of the decisive contribution of labor and management in the United Nations are carefully analyzed in contrast to the Axis manpower boasts.

**Partners in Production**—(announced in this department in October).

16mm. sound prints of this first hlock of films are available now for rental and sale. Additional groups of *Public Affairs Films* will be announced for release quarterly during 1945. The series will comprise films produced in Canada, other countries of the United Nations as well as U. S. productions. Subject matter treated will range from industrial relations to public health and will include films dealing with housing, city planning, citizenship, and international relations. More detailed information will be available in a folder entitled *Public Affairs Films* which may be obtained from Brandon Films.

■ **OFFICIAL FILMS**, 625 Madison Ave., New York 22, have issued their latest Sportbeam:

**Kennel Kings**—all types of thoroughbred dogs seen competing for laurels in the Morris and Essex Dog Show, New Jersey.

■ **PICTORIAL FILMS, INC.**, 1270 Sixth Ave., New York, have the distribution of the following two-reel National Film Board of Canada productions:

**Before They Are Six**—a description of Canada's day nurseries where children can be looked after during their mother's absence at work in essential war factories.

**It's Your Pigeon**—the story of homing pigeons, unsung heroes of this war. How these vital birds carry out their duty is shown in dramatic detail. Ca-

nadian airmen are pictured caring for the pigeons in their lofts, handling them in the plane and depending on them to save their lives after the craft has been forced down.

## Entertainment Releases in 16mm

■ **WALTER O. GUTLOHN, INC.**, 25 W. 25th St., New York 19, have released the following features:

**Bombardier** — an RKO production with Pat O'Brien, Randolph Scott and

Anne Shirley. A friendly professional rivalry, and a four cornered romance are portrayed in this thrilling "inside story" of America's great secret weapon, the modern bombsight.

**This Land Is Mine**—another RKO feature that boasts a cast including Charles Laughton, Maureen O'Hara, Walter Slezak and George Sanders. This is a moving and inspiring drama of Nazi occupation of a French town. The argument for the democratic way of life is masterfully set forth in the character of a schoolmaster played by Charles Laughton.

**Mister Big** (Universal)—Donald O'Connor and youngsters dispense song, dance and the patter of the jitterbug set.

■ **BELL & HOWELL CO.**, 1801 Larchmont Ave., Chicago, announce several new Universal pictures which will be available for approved non-theatrical audiences. Among them are:  
**Get Going**—6 reels—a gay comedy of

Washington's housing shortage and women in wartime.

**All By Myself**—6 reels—a light romantic story with musical interludes, featuring Rosemary Lane, Patric Knowles and Neil Hamilton.

■ **COMMONWEALTH PICTURES CORP.**, 729 Seventh Ave., New York 19, make the startling announcement that they will release twenty-five new major company features in 1945. In addition to sixteen new western, outdoor, and adventure pictures, they announce:

**As You Like It**—with Laurence Olivier and Elizabeth Bergner.

**Duke of West Point**—with Joan Fontaine and Richard Carlson.

**International Lady** — with George Brent, Ilona Massey and Basil Rathbone.

**King of the Turf**—with Adolphe Menjou and Dolores Costello.

**South of Pango Pango**—with Victor McLaglen, Jon Hall and Frances Farmer.

## New Catalogs

■ The 1944-45 Catalog of Institutional Cinema Service, 1560 Broadway, New York City, includes not only its customary listings of 16mm silent and sound films for rental, but also a special Sales Section, listing short subjects of instructional value to schools and institutions seeking to build up their own libraries of teaching films. Also included in this section are Religious, Sport and Juvenile subjects. Full information is given as to prices.

The rental section of the Catalog includes some of the latest 16mm sound releases of Hollywood productions, such as "Little Lord Fauntleroy" "Adventures of Tom Sawyer" and other outstanding Selznick releases.

■ **Y.M.C.A. Motion Picture Bureau**, 347 Madison Ave., New York 17, has compiled eleven Classified Film Lists from its library of films for convenience in locating proper subjects for particular programs. These eleven classifications are:

**Character Education**—designed to be especially helpful to mature groups concerned with juvenile delinquency.

**Civics and History**—includes a number of Warner Bros. dramatic and historical films in technicolor.

**Health and Safety**—recent additions to which are the new films "Psychiatry in Action" and "Magic Bullets."

**Inter-American Affairs** — offering many new C.I.A.A. films.

**Religion and Theology** — including subjects produced by Cathedral Films, Harmon Foundation and others.

**Sciences**—biology, chemistry, physics, astronomy, geology, physical geography, social, general science, and films on food and nutrition.

**Sports, and Athletics**—over 50 pictures on practically every sport and recreational activity.

**Transportation and Communication**—films on aviation, rubber, etc.

**Travel and Adventure**—covering the "world we live in."

**Vocations**—a carefully selected group of subjects.

**War**—scenes of the war on all fighting fronts.

# AMONG THE PRODUCERS

## Anniversary Issue of Visual Review

Rounding out twenty-five years of activity in the field of visual education, the Society For Visual Education this month will publish an anniversary number of Visual Review, official publication of the organization. Plans call for the printing of over 50,000 copies to be distributed free to those interested in the movement.

Heading an imposing table of contents is an article authored by Nelson L. Greene, editor of EDUCATIONAL SCREEN, dealing with the early history of the SVE. Ellsworth C. Dent, general manager of the Society For Visual Education contributes a story of the progress made by that organization in the quarter of a century period.

Because of the importance of visual education in the training of men and women in our armed services, Commander Patrick Murphy discusses "Training Films in the Coast Guard." The same subject is also dealt with from the marine corps and air service command angle in two articles by Captain Walter S. Bell and Major Lewis Peterson. In a similar vein Paul Wendt writes about "An Educator's Overview of the Audio-Visual Program of the Armed Forces."

Students of racial problems will find material for thought in "The Function of Visual Aids in International Learning" by Esther I. Berg. Other articles appearing in the same issue are: "U.S.O.E. Visual Unit Aids" by Paul C. Reed; "Films and the Canadian Nation" by Eva Geisel; "Looking Ahead" by Margaret Brayton, and a discussion on visualizing your meetings by Dr. Sidney W. Powell.

The anniversary edition is attractively compiled and well illustrated.

## Another Anniversary

E. L. Schroeder, General Sales Manager and Director of Advertising for Victor Animatograph Corporation, Davenport, Iowa, manufacturer of 16mm projectors and cameras and allied equipment, has just rounded out a full quarter of century of service with the

Ernie Schroeder

organization. Schroeder, or "Ernie", as he is known to a host of friends in the business, is one of the oldest executives in point of service in the visual education industry, and personally knows literally thousands of distributors, dealers and users of 16mm equipment.

With him it is a case of a hobby being turned into a life's vocation. As a youth in Davenport he made an avocation of photography and when he found that the Victor Corporation was producing hundreds of thousands of lantern slides for the then Hillis "Better America" lecture series, he applied for a job in the dark room. This was in 1919, nine years after the organization was established. Later, in his upward march, he was made Manager of the Lantern Slide and Stereopticon Department. He built up the Victor slide library from a stock of some 4,800 negatives to a total of nearly 71,000, which accounted for 570 lecture sets on religion and ethics, education and industry.

In 1923, Schroeder was appointed Director of all dealer sales. He was the first to set up a specially trained force of salesmen to sell and service 16mm sound projectors. In 1934, he was made General Sales Manager.

Sales today is Ernie's chief vocation and he is so much engrossed in it that he is one of the most active members of the National Association of Sales Executives, devoting much time to teaching classes in sales technique.

## Kime Adds to Kodachrome Library

More than 500 Kodachromes have recently been added to the library of 2 x 2 slides carried by Kime Kolor Pictures of Altadena, California. They comprise a variety of subject matter on the United States, Canada and Hawaii, including many scenes of California Missions, famous buildings and other places of interest in San Francisco, Los Angeles, Hollywood; National Parks of the western states; Canadian beauty spots, scenics and native customs of Hawaii. Also included are a number of views of War planes and Navy ships.

Further information and prices may be secured by writing to Kime Kolor Pictures.

## Color Slides on Latin America

The Shadow Arts Studio of San Luis Obispo, California, announces the exclusive distribution of the Violich collection of some 500 2 x 2 Kodachrome slides on Latin American countries. Architect, traveler and photographer, Francis J. Violich is also author of the book "Cities of Latin America". It was while gathering data for this book, during which he traveled thou-

sands of miles through Central and South America that he created this collection of Kodachromes, which reflect the manner of living, working and play of the peoples of these countries.

Two separate services have been inaugurated in connection with the distribution of these slides. First, a rental service for selected sets of the slides for temporary use, and second, the catalog listing and describing the collection, provides to the prospective purchaser an evaluation of the technical quality of each slide and suggestions of subject-areas in which they may be used effectively.

## Margaret Ostrom Now Bell & Howell Advertising Manager

Bell & Howell Co., Chicago, announces the promotion of Margaret Ostrom to acting advertising manager.

(Photo by Laurence)

For the past two years, she has been assistant advertising manager, under the supervision of Mr. J. H. Booth, Bell & Howell Vice-President in charge of advertising. Sales and instruction literature, government manuals, national advertising, Bell & Howell dealer, consumer and employee house organs, and publicity are handled by the department which Mrs. Ostrom now heads after twelve years of service with the company.

## New Swank Catalog

Swank Motion Pictures, 614 N. Skinker Blvd., St. Louis 5, Missouri, has just issued its new Visual Equipment Catalog. A wide line of equipment and accessories is described, including 16mm sound projectors, slide and stillfilm projectors, screens—and such accessories as projector stands, rewinders, film splicers, projector lenses and lamps, reels, cases, etc. A helpful section gives prospective purchasers information on priority regulations and ratings. The company will be glad to send a copy of the catalog to any one interested.

## 3 GREAT MOTION PICTURES

*Recommended by the Motion Picture Committee of the Department of Secondary Education of the National Education Association*

### AS YOU LIKE IT

Two great stage and screen artists are featured in this notably fine filming of Shakespeare's most delightful romantic comedy—Elizabeth Bergner as the wise and witty Rosalind, and Laurence Olivier as the modest and courageous Orlando. The artistry of the stars, fine supporting cast, settings, costumes all add up to a film of unusual merit for schools. Study guide available.

### ONE-THIRD OF A NATION

Based on President Roosevelt's observation that one-third of a nation is ill-housed, ill-clad and ill-nourished, this dramatic story is at the same time an outstanding "documentary" film on a vital social problem—city slum conditions. A subject of great value in high school civics and sociology classes. Study guide available.

### SCROOGE

Excellent interpretation of Dickens classic. Renders truly and beautifully the story, backgrounds and spirit of the immortal "Christmas Carol". Character portrayals, especially that of Seymour Hicks as "Scrooge", are delightful throughout.

Plan now to include  
these important RCA  
**TEACHING TOOLS**  
in your post-war  
school improvement  
program

**RCA 16MM. SOUND MOVIE PROJECTORS**—The New RCA 16mm. Sound Projector for Schools, when available, will include many important advances in projector design, such as even-tension take-up; removable gate for easy projector aperture cleaning; centralized controls; rewind without changing reels; one-point oiling, etc. Because of military demands these new RCA projectors are not available now for civilian use. But be sure to see the new RCA projector at your RCA dealer's showroom before you purchase post-war equipment.

**RCA SCHOOL SOUND SYSTEMS**—RCA School Sound Systems provide a simple means for quick, easy distribution of radio programs, phonograph recordings to any or all rooms of a school. An RCA Sound System also serves as a communication center from which the School Administrator, his assistants or members of the faculty, or student body can effect instant contact with any or every part of the school. Student interest can be greatly stimulated in the social studies, drama, music, and other subjects through the use of simulated broadcasts.

**RCA—"FM" RECEIVERS AND TRANSMITTERS**—RCA has been and will continue to be a leader in the development of "FM". While the war has stopped production of FM transmitters and receivers for civilian use, those connected with school management will certainly want to learn about "FM" to help them do a better job of post-war planning. A letter or postal card addressed:—The Educational Department, Radio Corporation of America, Camden, N. J., will bring information about this new type of broadcasting.

**RCA—VICTOR RECORDS AND RCA PLAYERS**—Already well established as an extremely useful teaching tool, Victor records and RCA Victor record players are growing more and more popular in classroom work. Thousands of records are available to help teachers in music, speech, drama, foreign languages, history, literature and many other subjects. RCA Recording Equipment permits the making of instantaneous disc recordings of group or individual student programs. Recordings can also be made of incoming radio programs.

Other RCA Teaching Tools

RCA Test and Laboratory Equipment provides a way in which students can understand more quickly and thoroughly the fundamentals of electronics as they are applied in radio, television and other fields. The RCA Electron Microscope, far more powerful than the finest optical microscopes, will be "must" equipment for most schools after the war.

**RADIO CORPORATION OF AMERICA**

RCA VICTOR DIVISION • CAMDEN, N. J.

LEADS THE WAY in Radio, Television, Tubes, Phonographs, Records, Electronics

Your DeVRY provides you with a Sound System that can be used separately for Field Days, Athletic and other similar events.

Your DeVRY separate Sound System is equipped with jacks for quick microphone or recorder hook-up—for Dramatic Classes, Assemblies, Forums.

PLACE YOUR ORDER NOW!

**GET THE TRIPLE-VALUE DeVRY**

**16mm. Sound-on-Film Projector**

**T**HE Triple-Value DeVRY is MANY machines in one. It offers you—in two light, easily carried cases—(1) all you need for 16 mm. SOUND MOTION PICTURE projection—(2) A mechanism adaptable to SILENT MOTION PICTURE PROJECTION, and (3) A SEPARATE AMPLIFYING SYSTEM for Lectures, Mass Meetings, Convocation or Dramatic Classes.

DeVRY High-Fidelity Sound is THE-ATER QUALITY. Speech is amplified in clear, crisp naturalness . . . Music is reproduced in full color and natural fidelity of tone, from crescendos to whispers—from the deepest bass to the highest coloratura—at any volume.

DeVRY Precision Projection gives you in the school assembly hall, or auditorium, that same type of flawless rock-steady image for which professional projectionists and theater operators the world over give credit to DeVRY.

DeVRY Precision 16 mm. MOTION PICTURE SOUND PROJECTORS are built by those same master craftsmen, from those identical materials, and according to the same specifications that won DeVRY CORPORATION its Fourth Army-Navy "E" award for excellence in the production of motion picture sound equipment—the only such award so far accorded any manufacturer for this type of equipment.

Select the Triple-Value DeVRY for its engineering and production excellence and wide diversity of uses; for its quality performance and for the long, trouble-free service it will give you.

WRITE for colorful literature—TODAY. No obligation. To assure School of TOMORROW'S best in 16 mm. sound-on-film projection, place your order for a DeVRY TODAY.

# Last Call!

THE 20th EDITION

# "1000 and ONE"

1944-45

The Blue Book of Non-Theatrical Films, EDUCATIONAL SCREEN'S annual Directory, was originally announced for production on October 15. Increased editorial work, necessitated by the large numbers of new war films, and wartime paper and printing difficulties have resulted in a six weeks delay in publication, but all orders have now been shipped.

The published price of the 1944-45 edition of "1000 and One" is

**\$1.00 per copy**

This Standard Reference Tool lists more than six thousand answers to that perennial and puzzling question, "Where will I find a film on this subject?" Classified in five Indexes, under 176 descriptive headings, and indicating producers, main sources, size and length of film

"1000 and One" will be more than ever *The Indispensable Tool* for all teachers, administrators, supervisors, directors of visual education, program chairmen, and producers and distributors of non-theatrical films.

## Free Introductory Offer

ONE FREE COPY of "1000 and One" will be mailed to all regular subscribers of EDUCATIONAL SCREEN whose requests for such copies are received before December 31.

WE URGE EVERY SUBSCRIBER TO TAKE ADVANTAGE OF THIS FREE OFFER. WE CALL IT AN INTRODUCTORY OFFER because we want you to INTRODUCE "1000 and One" to your colleagues.

## Don't Be Disappointed

This Introductory Offer Expires December 31  
and is available to new and old subscribers to

## "Now History II Will Hear Dr. Franklin"

... And by the magic of a B&H Filmosound Projector, with the film *Our Constitution* rented from Filmosound Library, Benjamin Franklin and other American leaders make history live and breathe! History is vitalized; brought to life on the screen, it becomes happenings always to be remembered, great men and deeds to be emulated.

There are scores of fine 16mm. sound films for history study which your school can rent easily and at little cost. And to teachers of virtually any other subject, too, Filmosound Library offers

rich treasures of instructive films.

A Filmosound Projector will reproduce these films with marvelous accuracy. Our accelerated research in Opti-onics—optics, electronics, and mechanics—is resulting in Filmosounds even better than before. Better in true-to-life sound; in clearer, sharper pictures; in cooler, more quiet operation; in simplified controls.

# Before you select your *post-war* Sound Projectors...

**Consider  
These Facts:**

1. An efficient 16 mm. sound-on-film projector will be the heart of your post-war visual aid program. Such a machine is a precision instrument that must possess ruggedness. It must be easy to operate. It must be soundly designed. It must be able to deliver effective tone quality and clear illumination continuously under amateur operation.
2. It requires years of service under actual operating conditions to develop a sound projector to meet these stiff requirements.
3. Ampro 16 mm. sound projectors served thousands of schools and universities for many years before the war.
4. During the war—Ampro projectors were tested and approved as equipment for the U. S. armed forces on fighting fronts the world over.
5. This vast background of experience is your assurance that Ampro projectors can best meet the needs of your school program.

To keep in touch with newest developments in motion picture projection, write today for latest information on Ampro 8 mm. silent and 16 mm. silent and sound projectors.

## *Editorial*

# *The Arts of Wartime Visualized*

CHICAGO was favored the past fall with two exhibits which were notable examples of visual education at work for the public good. "The Pacific Theater" at the Navy Pier offered a great visualization of the power of America as concentrated upon one grim goal, the winning of the most ghastly war in history. The exhibit was huge, intricate, thrilling, timely for the great public that likes to come, look and leave at a speed typically American. The sheer magnitude of the display, and the multitude of people swarming through, largely neutralized the purpose of it all and left immense educational possibilities unrealized. A plethora of ocular sensation can spell a paucity of learning. In thorough contrast was the exhibit of the "Art of the United Nations" at the Art Institute of Chicago, offering a few glimpses from the age-long pageant of man's artistic achievement. It was small, intimate, inspiring, timeless for the minority public that cares to linger, gaze, contemplate and thereby learn. Its educational values were limited only by the inclination and capacity of the visitor.

### *"The Pacific Theater"*

The United States Navy here did a masterful visual presentation of its mighty two-fold task, the preliminary training of a vast personnel and its actual performance in conflict at sea and ashore. Total war equipment was shown in person—guns, howitzers, mortars, anti-aircraft batteries, of all types and calibres—rockets, flares, torpedoes, bombs, rocket bombs—small craft of many kinds, PT boats, landing ships moored at the lake shore with the public free to go aboard in block-long waiting lines—plus complete, fully-manned demonstrations of landing on a hostile shore amid gun-fire, land mines and depth bombs. Then beautiful models of every type of Navy ship, some in transparent plastic showing every detail of internal arrangement and fittings—countless photographs, charts, diagrams, dioramas—working models of intricate machines. The actual one-man Jap submarine captured in Pearl Harbor. Helicopters in action, taking up any spectator willing to wait his turn. Finally, an elaborate display of radio and radar with full demonstrations of their applications, the walkie-talkie, "portable" field sets (portable by five men), depth sounding, sound detection, sound recording on a wire, radar signaling. Even the great Norden bombsight, so long a hush-hush top secret, was there. Perhaps the high point of interest came in the expert demonstrations of how the Navy teaches, with visual aids, the landing procedure from ship to shore, semaphore and code signalling, fire control, plane recognition, "night eye" efficiency for lookouts, gun manipulation, and the rest of the "know how" vital for victory. "Only trouble," said weary officers in charge, "you can't demonstrate anything to crowds like that. They're

learning nothing." Outer gates had to be closed for hours, holding back throngs until crammed buildings inside could be emptied. As an educative performance it was a case of too much for too many. On crowded days there was scarcely time to look, much less to think.

### *"Art of the United Nations"*

Sometimes an hour away from the office is worth a day at the desk. We spent such an hour recently at a unique exhibit, entitled as above, at the Art Institute. It was visual education for the public functioning at its best. In the words of the Director, Daniel Catton Rich, in the preface to the beautiful brochure prepared to accompany the exhibit, it was "a new kind of exhibition. It brings together thirty seven objects of art, one from each of the United Nations . . . paintings, sculpture, prints and decorative arts, chosen for their aesthetic qualities . . . not limited to any one period or civilization or style or medium. It is not a political exhibition. It suggests nothing beyond the fact that every people makes art, and when that art is good other people like to see it . . . Neither is it a war exhibition. No object, even those by contemporaries, treats of the present struggle . . . It is not educational in the sense that you are invited to read this art in terms of history, philosophy, religion, or geographic boundaries. No mere collection of objects, no matter how vast, can tell the entire story of centuries of world civilization . . . Art is only one means of human understanding . . . If such an exhibition can widen our aesthetic horizons and increase our pleasure in art, the Art Institute will consider it a success." Truly a masterpiece of understatement and modest claim!

Even one hour spent before those thirty seven objects, beautifully arranged in small galleries isolated from the rest of the great museum, is richly "educational". The spectator is submerged in history, religion, philosophy and geography before those silent bits of immortality, made by mortal men in many lands and many times. How escape a new sense of the span of human experience when we face an alabaster Chaldean head, "carved in stone by untempered metal", that has endured 4000 years of time and twice 4000 miles of travel to meet our eyes with its still untiring gaze? Religion and philosophy crowd upon us as we go backward in time from the Mask of the Hawk Devil from Liberia (1800) to The Adoration of the Shepherds painted by Gregorio Vasquez of Colombia before 1700 (our cover picture for December by permission of The Art Institute), a stone Aztec Goddess of Life and Death and a wooden icon from old Moscow (1500), a bronze Dancing Siva from India and the famous Codex of the Gospels from Ethiopia (1400), an enamel plaque of a Bishop of Verdun from Luxembourg (1200), a misty Mountain Wa-

# The Improvement of Audio-Visual Materials

Bruce Findlay

*An interview with Bruce Findlay,  
at Audio-Visual Headquarters of  
the Los Angeles City Schools.*

By D R. E D G A R D A L E  
Ohio State University, Columbus, Ohio

Edgar Dale

**T**HIS summer when I was working for the first Motion Picture Unit of the Army Air Forces at Culver City, I had an opportunity to take advantage of my nearness to Los Angeles to see their Division of Audio-Visual Education. So I telephoned Bruce Findlay, Head Supervisor, Audio-Visual Education Section, Los Angeles City Schools; and he said "Come down, and I'll show you something."

I did and he did. And I got in that visit a clear-cut visualization of what we can accomplish in this field in the United States. I saw a fulfillment of what I had been hoping for and talking about. I saw a working, workable program of audio-visual materials actually geared into the curriculum and instruction program of a great city—a city with 9500 teachers.

Bruce Findlay has one big, powerful idea that he keeps hammering home in Los Angeles. You don't learn by looking; you learn by *participating*. Participation must be planned. It should be responsible participation, either mental or physical.

You might actually do writing as part of a teaching program in the writing field. Or you might *do* thinking—react mentally to what you see pictured or hear. But says Bruce Findlay, "The film may reel it off, but that isn't any guarantee that the viewer will reel it in; and you will get maximum learning in minimum time with audio-visual materials only when the individual actively participates."

"How can the individual participate?" I asked.

"Well, first of all," he replied, "the learner has to have a purpose—a purpose that isn't satisfied by mere entertainment. That purpose has to save enough momentum to carry through a period of study. Maybe the child has been motivated to want to write a legible letter. If so, our visual materials can help him—can be the means to an end. Our filmstrip, 'Write Soon,' does that very thing."

"Can the visual materials, themselves, supply the purpose?"

"Of course they can; and we build motivations into some of our filmstrips or recordings or films that we are making. But I don't think you can ever hope to have teaching materials that are complete. One item must complement another."

"You don't like the term, visual aids?" I queried.

"In many cases the term is well applied, for aids bring to mind crutches. The body of thought in many audio-visual materials is so weak that it could not stand alone without crutches of some sort. The term, 'visual aids,' suggests that visual materials or recordings are supplementary—that you can use them or not depending on how you feel that day. Visual materials *aren't* frosting on an educational cake. They're bread and butter, meat and potatoes."

"All right, let's get back to this matter of participation. How do you get the pupil to participate?"

"There are many ways of getting it. I'll describe several of them. You can have the student do problem-solving. For example, in our filmstrip, 'Planning of a Kitchen,' alternative proposals are made and the film audience invited to make judgments about which layout is best. At the end of the film, the architect's choice of the solution is given.

"In motion pictures, it is possible to have the students learn in the 'leader' of the film that near the end of the film some problems will be presented. Pupils may write their answers. Then the film continues and gives solutions in the final leader strip.

"In another case we use a transcription of a 'Mirrophone' for the purpose of illustrating different qualities of voices. The students, acting as tone detectives, distinguish the good qualities of voice from those that need improvement. In our sound slide film 'Instruments of the Orchestra,' sound detection is used for the purpose of identifying the instruments by means of their sounds.

"In a filmstrip on skill in the use of shop tools, designed for junior high schools, we have combined a

number of techniques. Among these are selection, completion, comparison, problem-solving, identification, and false-true. The teacher may or may not use work sheets.

"Actually, of course," continued Mr. Findlay, "all we are doing here is what we should have been doing with reading. In work-type reading, we want more than the reproduction of the content of the material. We want evaluation, analysis, criticism, application—the same participation that is used in viewing films and photographs, or models, or listening to recordings. We want to take visual materials out of the realm of entertainment.

"In other words," I pointed out, "you're trying to see that situations are set up so that the film or recording ends not with a period but rather with a semi-colon. You're trying to see that an obligation is set up in the mind of the learner."

"Exactly. And we can eliminate a lot of mistakes, a lot of futile wandering in the educational desert, if we'll learn to make the student a participant in the learning process—not merely a recipient as we have so often done in the past."

"What kinds of materials do you have in your library?" I asked. The answer was a tour of their audio-visual building, a three-story affair which has a floor space of approximately 30,000 square feet. In this building they now have:

Sound Motion Picture Films	5,485
Silent Motion Picture Films	1,640
Electrical Transcriptions and Records	5,114
Sound Slides	267
Filmstrips	2,301
Lantern Slides (2" x 2" Kodachromes)	38,432
Lantern Slides (3 1/4" x 4")	200,258
Study Prints	751,669
Stillfilms	3,678
Portfolios and Art Prints	10,290
Stereographs	69,368
Wall Charts	3,574
Folding Charts	319
Folders	66
Exhibits and Working Models	14,938
Flags	791
Permanent Loans to Schools (Sets)	265

Employees in the Audio-Visual Education Section participate (below) as well as Los Angeles teachers (right).

The teachers of Los Angeles are informed about these materials in a variety of ways, of which the following are most important:

1. Catalogs of elementary and secondary materials arranged by subject.
2. Teaching demonstrations with audio-visual tools for the purpose of informing principals and teachers how to utilize these materials. Materials are held after school, and materials are taken to the school.
3. Bulletins.
4. Announcements in the official teachers' magazine.
5. School publications, such as, "Participation, the Last Word in Films," "Audio-Visual Tools That Teach for Keeps," and "Slide Making."

The audio-visual program of the Los Angeles City schools under the direction of Bruce Findlay is important for two reasons: First, we have here a program that is a "spearhead" for the rest of the country. Few, if any, equal it. Most audio-visual programs are years behind it.

Second, Los Angeles has an audio-visual program which does not rest its claim on spurious notions about the one-sense avenue, sight, but rather upon a wise, purposeful use of all types of concrete tools and emphasis upon participation of the student as a part of the learning process.

Third, its director does not have some pet scheme

# An Audio-Visual Program for Assembly

ROYDEN M. TRIPP

Central Junior High School, New Britain, Conn.

*How one Junior High School stimulated greater interest in audio-visual teaching among both students and faculty.*

SOME time ago our Audio-Visual Club was approached with the idea of presenting an assembly program. This was seized upon as an opportunity to give our club members a chance to show off a little as a reward which they richly deserved for the work of servicing equipment, projecting pictures, caring for film and all the drudgery that such work can become once the glamour has worn off. It was also a chance to present to the students and faculty some of the things that the audio visual program can do to help learning. We have found that the full use of audio-visual materials calls for a constant advertising of our wares. Audio-visual bulletins help, but whenever it is possible it is worthwhile to have demonstrations. An assembly program looked like a chance to kill both birds with a single stone.

We decided to present a demonstration of our varied equipment and what it would do. At first we had planned to combine the audio with the visual but it soon became obvious that if we were to offer an effective sample of each we would have to have more than one program. It finally developed that by a good deal of cutting we could get it down to two programs, one all auditory in nature and the other all visual. We planned the programs to use as many of the members of our Audio-Visual Club as possible, some of them for the speaking parts and the others operating the equipment. By spreading this thin everybody had some part.

The first program opened with a record of the Star Spangled Banner. Then the chairman, speaking by means of a microphone on the stage, made the announcements, and told briefly what our program aimed at doing. He then introduced a boy to tell what auditory aids could do to aid learning. The speech was brief for we were aiming at demonstration for the effective end of the program. He did, however, point out some of the highlights of an audio program, dealing chiefly with recordings. He applied this to the subjects taught in our school: the place of dramatizing events in Social Studies to give the illusion of reality not readily obtained from books; how an interest in English and Literature may be fostered by the readings of trained actors; the place of recordings in Music and Foreign Languages. Science and Biography were also touched.

The chairman then introduced another boy whose purpose it was to explain our equipment as simply as possible. The boy had on the stage with him our transcription playback, the combination radio, recorder and playback, and he himself used the microphone. He first explained the microphone, how it was attached to an amplifier backstage (which the audience could not see) and produced the sound through the speakers on the wall. He explained that

attached to the amplifier was a turntable and a pick-up arm which would play records. A boy operating the turntable played a few bars from a record to illustrate. Continuing, he explained the difference between ordinary records which reproduce at 78 rpm and transcriptions which play at 33 $\frac{1}{3}$ , showing each type to the audience as he told about them. He demonstrated how our playback could be changed from one speed to another, running it at each speed. In order to enable the audience to see this change of speed he fastened a small flag to the turntable which could be seen all over the auditorium. He concluded by describing the combination radio and recorder, telling how it could be used to present radio broadcasts of timely interest, and how the recorder was used.

The chairman then took charge and introduced the first of the demonstrations, a member of the club using the recorder to cut a record. By the cooperation of the Senior Dramatic club we had a girl read a poem into the microphone which was recorded, and played back for the members of the assembly.

The next to be shown was a radio transcription. We chose for this the first program from the series "Lest We Forget—A Better World for Youth." (This series we obtained from the Institute for Oral and Visual Education.) It was pointed out that by the use of a transcription player we are able to use these programs when and where we want them. The assistant then presented three or four minutes of the program, enough to give an idea of what it was about.

Demonstration of a recording

Next the audience was asked "How many times have you heard something on the radio which you would like to hear again?" They were then told that many such things are available on records. As a sample of this a record of Kate Smith singing "God Bless America" was presented. The audience joined in the singing. Further illustration of the value of recordings was in the preservation of the sounds of one generation for those of others. We chose "Sounds of History—1939, Then Came War." Although there are

Using the Microphone

many things in these four records we presented only a short bit of the introduction by Elmer Davis, Hitler in one of his early tirades, Chamberlain as he says "Peace in our time" before the program moved on to another part.

As to the part that our audio equipment plays in the social life of the school, we showed how it regularly furnishes music for Social Dancing Class, for the Social Dancing Club, and for school parties which are held after school. By means of records it was possible for students to dance to the music of nationally famous dance bands. To illustrate, we presented a bit of a record by one of the famous "sweet" bands, then after an introduction in the lingo of the "Hep cat" an equally famous "hot" band played a little "jive".

Although we had timed our program several times we wanted to be sure that it would end on time yet not have to be cut off before the end. In order to do this we confined the last section merely to presenting bits of a number of records with no introduction beyond title and performer. With several of these ready, it was necessary only for the chairman to keep watch of the time and stop each record when time gave out. We used Carl Sandburg singing "I Ride an Old Paint"; Raymond Massey in "Abe Lincoln In Illinois", his reply to Stephen A. Douglas; Robert Frost reading "Mending Wall"; Ida C. Ward of the University of London reading from Dickens' "A Christmas Carol". The program was brought to a close with our conception of Donald Duck. This was done by playing a bit of a 33½ rpm recording at 78 rpm.

On another occasion we presented the visual part of the program, arranged much the same as the preceding one had been. The chairman introduced all who participated. Those who acted merely as operators of projection equipment received recognition by being introduced too. The stage was well decorated with maps, charts, globes, etc. as the curtain was drawn. Then the projection screen slowly came down. The chairman made the general introduction, telling a few of the things which we hoped to accomplish from the program. He then introduced a student to tell something about slides.

This boy outlined some of the merits of the 35mm slide projector, and had his operator show some slides. We presented a sequence in Kodachrome 2" x 2" showing the development of the Monarch Butterfly for the Science angle, then a few scenes from Ancient Greece

and Rome for History, a diagram or two for Physics and Math, Roman costumes and homes for Latin. We closed with a few scenes taken at school on 35mm Kodachrome.

The chairman then mentioned that this projector could be used to show filmstrips or filmstrips but that a slight change was necessary. While the operator made this change another boy presented some 3 x 4 slides. Another pupil told some of the good points of this size of slide. These points were illustrated by presenting a Unit on Astronomy from the Keystone General Science Units. The speaker brought out how difficult it was to get ideas across in such a subject because of its very nature and how helpful slides could be. The possibility of using 4 x 4 slides for typed messages was shown by presenting two slides on gardening made with "Radio Mats". A health cartoon showing the place of milk in nutrition made on etched glass with colored pencil was then shown. This was followed by a photographic lantern slide made from snapshots of members of the school's athletic teams. Another student then told something about 35mm filmstrips. To illustrate this the projectionist showed one of the series put out by the S.V.E. and the Coronet Magazine and later one for Latin and Ancient History.

The next boy presented motion pictures in general, discussing their place in education and their most outstanding qualities as motion, animated diagrams, time lapse photography, travel, costumes and stage settings to give authenticity to films of the past, and other well recognized points of merit. He spent a few months applying the use of motion pictures to Social Studies, General Science, English, Guidance, Art and Music. To illustrate this a short section of the silent film *Chemical Effects of Electricity* was shown. The film was started showing some actual scenes, allowed to run into the animated drawings, then stopped. Another student then explained some of the advantages of sound properly synchronized with the film and how this may be in the form of a running comment, by dialogue, by natural sounds, etc. We then showed a little of the sound film *The Earth's Rocky Crust*. To close the program were shown a little of the motion pictures which the Audio-Visual Club has taken of social events in the school such as First Aid Practice, Playday at the Park, Boys Track meet, Memorial Day Exercises. Comments on these were made by means of a microphone attached to the projector.

To insure a smooth running program we presented 3 x 4 slides while the 35mm projector was being converted to project filmstrips. We mounted one of our sound projectors in the balcony and the other on the floor of the auditorium. The one on the floor we used at silent speed for silent film. By having them both ready, and using the silent one first, the operator was able to prepare for the second silent film while another operator was running the sound film. As the school films had no sequence, but were a series of unrelated scenes, we were able to end the program at any time by simply fading out and stopping the projector. Inasmuch as candidates for admission to the club for next year are already making inquiries, we know that at least one of the purposes of the programs was attained.

# The Curriculum Clinic

## Do Films Serve the Primary Grades?

WALTER A. WITTICH, Editor  
and WALTER SOUTHERN, Librarian  
Bureau of Visual Instruction  
The University of Wisconsin

**D**O silent motion pictures serve the primary grades? This question has been asked often, and it is not surprising when we consider that most of the initial development in the field of film production and use began at the high school level. Increasingly during recent years, however, much new production has been focused at the primary and intermediate grade levels. Today it is safe to say that, in limited number, effective text or teaching films are available to teachers and children at the kindergarten and primary level.

Another question asked recurrently is whether or not sound films make a contribution to children at this age group. The answer again should be in the affirmative. To what extent the simultaneous appeal to two senses, sight and hearing, confuses these very young minds and thereby lessens comprehension, is a question still far from final answer. Even the desirable proportion of still moving pictures in primary teaching awaits much further research for exact determination. But there is no longer room for doubt that films, both silent and sound, when accurately selected to fit the particular teaching situation, yield definite values in the primary grades.

One important contribution of the text or teaching film for beginning school children is in establishing readiness for the reading and language arts experiences that lie just ahead of them. The experienced primary teacher realizes that, before she can do a successful job of leading her children toward beginning reading experiences, she must build backgrounds of understanding in those areas in which children will do reading. Reading itself is an utterly abstract experience. It is the type of learning situation in which we ask children to attach meaning and significance to what is to them merely a maze of lines, angles and curves. Obviously those children who have experienced seeing an animal of the zoo, for example, will more readily attach meaning to the word symbol expressing the name of the animal than will those children who have not had this meaningful visual experience. It should be noted, in passing, that many teachers for many years have been using slides to supply just such background in the teaching of beginning reading. Films can give additional values, especially in later stages which are concerned with more than mere word recognition.

Films can play an important role in the development of language facility. Witness the ordinary language arts period at the beginning grade levels. Children are asked to talk about what happened over the weekend, what they observed on the way to school, what they talk about in their homes, and what other miscellaneous experiences they might have encountered which may bear repetition. This immediately puts at a disadvantage the child who comes from an out-of-school environment that is less broad, and places at an ad-

vantage the child who comes from a rich home environment of good books and magazines, chances for travel, interesting conversations with his parents, and many opportunities to have his questions answered.

Very necessary, then, is the responsibility of the school for providing increasing opportunity for all the children to explore effectively the environment considered to be the domain of the primary grades; namely, experiences with home and family, the community, transportation, animals, seasonal changes, and community helpers. Uniform, authentic experiences in these areas may be made available to all the children, as a living experience shared in common, by means of a film which has been well planned, well photographed, well organized into logical and understandable sequences of action; and with the facility for showing, discussing, and reshowing as often as is necessary in order that every child come away with correct, indelibly fixed impressions of the new experiences he has virtually "lived."

The field trip, also, is good for creating these experiences. However, such factors as time, season, weather, and mechanical means of getting to and from the experience sought may present obstacles. With the teaching film logical organization is assured. Every child has a "front seat." Later questions can be answered, not by opinion or vague memory, but by an opportunity for again duplicating the experience by merely reshowing the film. Many teachers like a reshowing without the sound in order that the children may take turns supplying the commentary.

In order to secure these reading and language arts experiences for their children kindergarten and primary grade teachers are selecting such films as these (all are sound films, with running time in minutes shown after each title):

*Adventures of Bunny Rabbit* (10). The experiences of members of a family of rabbits. Bunny Rabbit confers with a frog and turtle, has lunch in a farmer's garden, is caught but escapes home.

*Airplane Trip* (10). A mother and daughter journey by air from Los Angeles to Salt Lake City. Airport servicing operations, duties of the stewardess, and panorama of the land from the sky are portrayed.

*Animals of the Zoo* (10). Wild animals in their zoo homes are shown. Feeding habits, characteristics, and habitats of such animals as lions, tigers, elephants, monkeys, polar bears, sea lions, and the hippopotamus are included.

*Black Bear Twins* (10). The experiences of a family of campers in observing a pair of small, hungry, and mischievous twin bears who invade camp, swim in the lake, and raid a bee hive.

*Boat Trip* (10). Happenings as a boy and a girl travel from Albany to New York City on the Hudson River—inspecting the boat, landing at a town, the wonders of the harbor.

*Care of Pets* (10). Children of about the age of third and fourth graders are shown taking care of a canary, gold fish, a cat, and a cocker spaniel puppy. The film emphasizes the responsibility that children must take as they help their pets

maintain themselves. A very fine film for young children who are learning the responsibility which they have toward their pets. *Colonial Children* (10). Depicts in an authentic setting the self-sufficient home life of Colonial times. Shows in detail the furnishings, clothing, customs, and events in a Colonial family's day from the morning chores to the reading of the Scriptures by the fireside in the evening.

*Dairy Farm* (14). Color). Life on a typical dairy farm: pasture scenes, milking cows, cooling milk, haying, and silo filling. Farm activities of children during the summer vacation.

*Down on the Farm* (10). Farm life scenes; driving the cattle to the pasture, cutting grain, feeding the turkeys, playing with a pet raccoon, fishing and swimming, riding on a hay rack.

*Elephants* (10). Attention is given to the physical features, food, methods of eating, drinking, and habits of elephants. A full-grown elephant is put through a series of tests for a circus buyer. Young elephants are shown learning tricks and to obey commands.

*Eskimo Children* (10). Depicts the Eskimo solution to problems of food, shelter, clothing, and transportation; tasks of parents and children; handicraft arts; forms of recreation; family and community customs; and changes resulting from recent outside contacts.

*Farm Animals* (10). A farmer's day caring for his animals, feeding and milking cows, working with horses, shearing sheep, and scenes showing a newborn colt, pigs, lambs nursing, and goats frolicking.

*Fireman* (10). Organization and activities of a company of firemen in a modern city. Care of equipment, drills, testing of trucks. A real fire shows the firemen in action.

*French-Canadian Children* (10). Winter home life, environment, and activities of a typical French-Canadian farm family in the Province of Quebec. School life, ice cutting, maple syrup refining.

*Goats* (10). Depicts the domestic life of a herd of goats on a farm. The feeding, milking and care of mature goats are shown. Two baby goats are depicted in characteristic activities. A billy goat pulls the farmer's boy in his miniature wagon to deliver milk.

*Gray Squirrel* (10). Life of a squirrel family in an oak tree. Mother Squirrel nurses her babies, they learn to play and climb, then how to crack nuts; they race against a red fox.

*Grey Owl's Little Brother* (10). How a Canadian backwoodsman raised a beaver. When the beaver is released, he still remembers his old master and comes when he slaps a paddle on the water's surface.

*Horse* (10). Development and training of a colt from one week to three years of age in the Blue Grass Country. Caring for the colt, training for cantering, the horse show.

*Letter To Grandmother* (20). Traces a letter from its actual writing to its rural delivery, and follows a package on the return journey. Each intermediate step is shown and explained.

*Mexican Children* (10). Home, school, and play life of a Mexican boy and girl. Food and eating habits, a holiday in the village, an Aztec costume dance to the strains of fiesta music.

*Navajo Children* (10). Relates the experiences of Navajo boy and girl in moving with their family from their winter quarters to their summer home. On reaching their destination, they are shown participating in the work of the family.

*Our Foster Mother, the Cow* (10). (Color). Portrays the happenings on a dairy farm with emphasis on the importance of milk, and the service of cows to mankind. The care and raising of cows.

*Passenger Train* (10). On a modern, streamlined Diesel-electric-powered train from a large city through a picturesque countryside. In the station, baggage cars, diner, and pullman.

*Poultry on the Farm* (10). Treats the appearance and habits of an adult and young chickens, ducks, geese, and turkeys. A chick embryo, chicks hatching, young ducklings swimming and feeding, and families of geese and turkeys are featured. Natural sounds of the poultry are reproduced.

(Concluded on page 435)

Activities stimulated by the showing of the Erpi classroom film, "The Fireman," to a second grade class.

(Top) Oral Expression. The children tell stories of their experiences and discuss interesting phases of the film.

(Center) Reading. The film has served as a reading readiness background. As the result of seeing a teaching film, children are more able to attach meaning to printed abstractions that we call words.

(Bottom) Art. The second graders are creating their reactions to the film on paper with crayons.

# The Film and International Understanding

## A Slide-Film Technique for World Problems

DR. JOHN E. DUGAN, Editor  
Haddon Heights, New Jersey

SLIDE-FILMS have proved to be very effective instruments of education in both the armed forces and the public schools and colleges. The technique of their use has by no means reached the limit of its development. They have contributed much to the winning of the war. There are those who think that this type of film can contribute much to the winning of the peace, provided that proper techniques are developed and used.

*How To Conquer War*, a current slide-film produced by Sydna White of Federalist Films in New York, seeks to present a contribution toward the solution of this great world problem. The technique used is worthy of consideration by all who are interested in the use of the slide-film in this field of international problems.

The film uses 190 news photos, engravings and titles to show how man created law to settle disputes with his neighbors and how he has repeatedly formed government for larger and larger units. A further development of this process is presented as a means by which man might solve his present problem of war.

The film is designed to be used with a speaker's commentary script which is furnished with the film. This script is well organized and arranged. The frames are listed by numbers and titles down the left-hand side of the page. Opposite each frame listing is the commentary which is to be read by the speaker for a frame.

A sample listing for six frames is presented here-with:

Fr. 4 (Air clipper)	No spot on earth is now remote. The miracle of flying—
Fr. 5 (Washington airport)	and airports round the globe
Fr. 6 (New York skyline)	tie our modern cities together.
Fr. 7 (Wheatfield)	Modern farm machinery alone makes possible an abundance of food and clothing never equalled.
Fr. 8 (Children in S. E. Russia)	Children in the Eastern Hemis- phere
Fr. 9 (American kids)	and children in the Western Hemisphere should be secure in the freedom from want forever.

The speaker also reads aloud to the audience the titles which appear in the film from time to time.

The adaptability of this type of presentation to various languages is immediately evident. All that the speaker in any particular language needs is a commentary script in that language. This script could be an exact translation, or it could be a script revised to take into consideration attitudes or customs in any particular country in which the language involved is used. Ideally of course, the titles which appear in the slide-film also should be in the language used by the speaker; but this is not absolutely necessary, since

the speaker reads the titles aloud to the audience. Each title appears on a separate frame, consequently proper frame notations in the script could give the proper translations.

Since the speaker reads aloud both the comment and the titles, this method would be particularly effective in areas of high illiteracy.

The speaker is an important part of the presentation of this type of slide-film. Recognizing this, the commentary script for *How To Conquer War* is prefaced by a page of "Instructions to Speaker". These instructions are concisely and intelligently arranged and presented. Although set up for this particular film, they have implications for the presentation of any slide-film by this method.

The first instruction is a fundamental one, but so often neglected that it bears repetition here: "One rehearsal of reading titles and script while projecting the film is necessary, two rehearsals desirable, and three better still for the smooth running of the film."

Another instruction is: "Read as intelligently as possible to help get the meaning over—and for a normal pace, two words a second. Keep the film moving. The long commentary should be read fast. Change of pace as indicated in the script will make it more effective." (The script has in it notations such as the following: "slower", "faster", "medium", "much emphasis", "drop emphasis".)

If instructions are followed, the actual presentation of the film takes approximately forty minutes. This can be continuous, or pauses can be allowed for discussion. If discussion is desired, the script suggests that the film be shown in two sections. It is so arranged that this can conveniently be done.

Little has been said about the content of this film, since it is the purpose of this article to discuss technique rather than content. Nevertheless, it should be said that the material of the film is well organized and well presented. It is set up in such a way that it should provoke intelligent discussion wherever it is shown.

*How to Conquer War* uses a slide-film technique which offers challenging possibilities to those who are interested in the application of the slide-film to world problems. Relatively speaking, the production of this type of slide-film is inexpensive and free of complications. Because of its size, it can be distributed easily and economically. The type of apparatus necessary for its exhibition also is relatively inexpensive and easy to move about, and its operation is exceedingly simple. Furthermore, it already is distributed over a very wide area.

The plan of having the script so effectively coordinated with the film frames, together with the ease with which scripts in various languages can be prepared, makes this type of slide-film presentation one

(Concluded on page 437)

## Chicago Is Not An Island

EDWIN J. THOMAS  
Staff Writer, EDUCATIONAL SCREEN

I'VE weathered the measles and the mumps, World War I and the Depression. But one of the worst blows of my life was the announcement, out of a clear sky, that our office was moving to Chicago, and the question would I care to go along?

I was born and educated on Long Island. I have written advertising copy for Erpi—now Encyclopedia Britannica Films—for fifteen years. Six days a week, fifty-two weeks a year, a total of four thousand six hundred and eighty days on that other island, Manhattan. I'd need time to think it over.

I was confident that within the sacred portals of my home I would find moral support if not sympathy. But I felt like a man who had been denied a fair trial when the youngsters greeted my announcement with whoops of joy, and my wife suggested that such a move might be a splendid thing for the children. The upshot was the suggestion that I fly to Chicago and look over the situation.

I felt like Columbus as the family drove me to La Guardia Field. I knew many Chicagoans. I knew that all of them praised the Windy City. But I had never been there. Besides, Long Island was to me the industrial film center of the world and, on the other side of the continent, Hollywood was the haven and heaven for the entertainment industry. In between, for me, was vast wilderness.

Vast indeed it seemed, as the mountains of Pennsylvania, the blast furnaces of Pittsburgh, the factories of Cleveland, Toledo, and South Bend unrolled under me. Then miles and miles of sand. Was this the Great American Desert? If so the blue water and lofty, awe-inspiring skyscrapers just beyond must be a mirage.

I felt a lot better when we circled an air field almost as modern as La Guardia. The enthusiasm was short-lived, however, when the hostess pointed out Cicero. Dim memories of its Al Capone past struggled vaguely for recall, but faded fast. For there, spread out below, were the Hawthorne works of the Western Electric Company, mother of telephones and mechanical sound, and also, I reminded myself, grandpa of Erpi itself. And incidentally the Western Electric Company was born in Chicago in 1872, under the birth name of Gray and Barton, in old Kinzie Street. We landed, and the motor trip to the Loop turned out to be almost as satisfactory as riding down the streets of Brooklyn. I saw trees!

The next morning, I bravely set forth on the first phase of my pilgrimage, viz. to present a letter of introduction to Nelson L. Greene, Editor-in-Chief of EDUCATIONAL SCREEN. Frankly I was going there still look-

ing for sympathy, for I knew that he too had come to Chicago many years before from New York. But if I expected consolation, certainly I did not get it. After the usual formalities, the editor took me to the window, and pointed out the nearby lofty towers of the London Guarantee Building, the Wrigley Building and the Tribune Tower. The first is erected on the original site of Chicago's famous Fort Dearborn and now houses Station WAIT. The other two, immediately across the Chicago River, house Stations WBBM (Columbia) and WGN (Mutual). Out of another window he pointed to the massive Merchandise Mart which houses WMAQ and NBC. All four are teeming today with important radio and television plans for the future.

As we stood by the window gazing out over the waters of Lake Michigan Mr. Greene briefly sketched the fascinating early history of Chicago and his experiences of twenty-five years

A Chicago movie set (Selig) of the early 1900's

The Granddaddy of Them All—the first model of the Amet Magniscope, produced by Spoor and Amet in 1894.

*Courtesy Rosenwald Museum of Science and Industry*

there. He spoke at length of Chicago's connection with the early chapters in the history of the movies, and its intimate associations with the beginnings of the non-theatrical and equipment phases of the industry. I had not before realized that some of the earliest theatrical studios were located in Chicago, that some of the early industrial motion picture companies started there, and, above all, that so many educational applications of the celluloid media were born in Chicago. The last-named so affected the early history of my own company that, in reality, its present decision meant almost a return to its true intellectual birthplace.

I urged Editor Greene on as he carried me along from the days of the packing-crate projector, with its head-achy flickers, to the 1944 streamlined version. Starting in the early 1900's when Spoor and Anderson, the Ess and Ay of the Essanay Studios on Argyle Avenue, began, he brought into retrospect such characters as Charlie Chaplin, Wallace Beery, Gloria Swanson, Francis X. Bushman, Beverly Bayne and others. While the Essanay Studios and their films do not

George Kleine

come under the educational classification, the building was frequently used during this period for the production of non-theatrical films, and today the renovated buildings still are being used by Wilding Productions. The year 1907 saw the organization of Bell and Howell, camera and projector manufacturers. One of the partners, Donald Bell, had previously been connected with George Spoor as a projectionist. Bell and Howell was, at a later date, to be one of the first projector companies to manufacture

Burton Holmes

and put 16mm cameras and projectors on the market.

One of the earliest "historical" motion pictures was produced by Colonel William N. Selig, head of the Selig Polyscope Company of Chicago. He began planning in 1909 to take advantage of three unique "props" floating in Jackson Park lagoon since the World's Columbian Exposition of 1893, namely the supposedly exact reproductions of the three Caravels of Columbus. In 1912 appeared the finished 3-reel feature, "The Coming of Columbus," which enjoyed a great popular success and won for the Colonel a commemorative medal from the Pope in Rome. Before 1915 Atlas Educational Films were being made in

Carl Laemmle

Chicago; Jam Handy and several other companies were also active.

Burton Holmes, another Chicagoan, was already showing travelog films and slides with his public lectures. About the time Holmes was gaining fame as one of the world's outstanding exponents of the joys of travel, Ernest M. Newman was also carving a niche for himself with the establishment of the Newman Lecture Company in Chicago. He had produced a number of 1-reel tourist films captioned "Newman Traveltalks" about 1909. These films were shown extensively in motion picture theatres and, in amplified form with lantern slides, when he presented them himself on the lecture platform.

The first so-called "educational" film catalog was issued in 1910 by George Kleine in Chicago. Kleine at that time represented the products of the Motion Picture Patents Company, and this catalog listed the subjects licensed by his organization to a surprisingly large total.

Though a number of feeble attempts were made by several organizations during this decade to produce non-theatrical films, it was not until Carl Laemmle who, together with Robert H. Cochrane and Watterson and Douglas Rothacker, organized the Industrial Moving Picture Company in 1910, that any really serious strides were made toward putting the production of non-theatrical films on a solid business basis. The Chicago trio, however, was short-lived, for Laemmle migrated to New York and in 1913 he disposed of his stock to the Rothacker brothers, who also left Chicago at a later date.

Up to this time projectors had been cumbersome, unwieldy instruments, but in 1912 two events took place

Herman A. DeVry

which did much to forward the non-theatrical film movement. In that year Herman A. DeVry introduced the first DeVry suitcase 35mm projector, and about the same time Victor Animatograph of Davenport, Iowa, put a similar device on the market.

Visual education received further stimulus in 1916 when Dr. George Amos Dorsey, Curator of the Field Museum and Associate Professor of Anthropology at the University of Chicago, made a series of travel films in India, China and Japan. These were released the same year in a group of split reels by Universal Productions.

Probably the biggest historical step toward true visual education was taken in 1919 when the Society for Visual Education was organized in Chicago. The Society is celebrating its twenty-fifth anniversary this year, and in the opinion of many educators it has been one of the outstanding factors in bring-

ing visual education to the position it occupies today.

The motivating powers behind the beginning of the Society for Visual Education were Harley Clarke, a Chicago utility tycoon, and Forest Ray Moulton, Professor of Astronomy at the University of Chicago. These two, more than anyone else, saw the possibilities of visual education. More important they realized that, unless the prevailing haphazard methods then in vogue were abandoned, the entire program was doomed. Financed by Clarke they surrounded themselves with the best educational talent in the United States. The path they hewed was hard. At times hit

Forest Ray Moulton

and miss, or at best by trial and error, the Society plodded its way through almost insurmountable obstacles. Even with the cream of the educational crop in charge, the venture at times seemed headed for failure. Perhaps its biggest obstacle was the dearth of proper equipment to show their films. After a long period of experimentation this was overcome when the Society entered the projector manufacturing field with the "Aeme SVE" projector, with the aim of making educational films economically feasible to the humblest educational institution. Later the Society, under Marie Witham's able administration, came to specialize in slides and film slides, and engineered and produced the highly successful SVE Tri-Purpose slide projector. Another later firm manufacturing slide projectors—the Golde Manufacturing Company—is also now located here.

In the fields of research on visual education, the first Doctor's thesis accepted by a great university (Colum-

bia) was J. J. Weber's dissertation, "Comparative Effectiveness of Some Visual Aids in Seventh Grade Instruction," published by The Educational Screen in 1922. In that same year the Commonwealth Fund grant of \$10,000 enabled Frank N. Freeman of the University of Chicago to inaugurate and supervise the most extensive series of research experiments yet made in the field. The results secured by his twelve investigators were presented in book form in 1924 under the title "Visual Education," published by University of Chicago Press.

The organization in Chicago of Pilgrim Photoplay Exchange in 1919, later to become Ideal Pictures Corporation, inaugurated another noteworthy development in the expanding use of films for educational purposes. It has continued its steady growth under its first President, Bertram Willoughby. Other film rental services located in Chicago are those of Bell and Howell, DeVry, College Film Center; and Castle Films, Films, Inc., Walter O. Gutlohn, Y.M.C.A., Roshon, Canadian National Film Board and British Information Services have offices here. Until well after 1919 non-theatrical films were available only in 35mm. While 35mm projection is ideal for auditorium and assembly rooms, and still finds wide educational usefulness there, the unwieldiness and weight of 35mm projectors—even the portable models—accounted in large measure for slow progress in the use of educational films in classrooms. The interest and experimentation in the development of smaller sizes, 28mm and finally 16mm, ended in the standardization of the latter. The next decade—1920-1930—saw the rapid development of portable 16mm projection equipment. Bell and Howell

Harley Clarke

Frank N. Freeman

Company, DeVry Corporation, Victor Animatograph Corporation (Davenport, Ia.), Ampro Corporation (organized in 1929 and in 1944 purchased by the General Precision Company), Holmes Company, RCA (Indianapolis)—are all located in the Chicago area. This is almost a complete roster of the leading 16mm equipment projector manufacturers with the single exception of the Eastman Kodak Company. Both leading manufacturers of screens—the Da-Lite Screen Company, and the Radiant Screen Corporation—and companies manufacturing many subsidiary visual-equipment items give Chicago and the Midwest major distinction in the production of audio-visual equipment.

The development of 16mm equipment and 16mm film libraries added a great impetus to the movement for widespread use of visual aids in the classrooms of the country. The Midwestern Forum of Audio-Visual Aids was organized in 1939 and has met each year since with increasing influence on the movement. The Educational Film Library Association, organized three years later as an association of educational libraries distributing audio-visual teaching materials, held its meeting in Chicago

last year at the time of the Midwestern Forum and completed a permanent organization which includes all of the film libraries connected with educational institutions of the country. The early story of the development of such libraries as the Ohio State Exchange, the University of Iowa and the Iowa State College Exchanges, the University of Wisconsin, the Bureau of Audio-Visual Aids at the University of Indiana, the University of Minnesota, would throw further light on the history of this movement. I wish there were time also to tell of recent experiments in film production (by the DeVry Company, Bell and Howell, and Coronet Pictures), and the stories which Mr. Greene told me of the amazing developments in the use of radio and movies in the public schools of Chicago and Cook County.

I began to see, in other words, the reasons for Chicago's enormous interest and activity in the visual education movement, and its important future role favored by its geographic location. With some 40 per cent of the entire school population of the country located within an overnight train journey, with forty-one (more than half of the total) cities of the country with a population of over

100,000 people in the great Midwest, the soundness of the decision to move the main offices of Britannica Films began to dawn on me.

I was fascinated also with Mr. Greene's account of the development of the relations between my company and the University of Chicago. It seems that in 1931, when Erpi Picture Consultants issued a series of scientific films in cooperation with that University, they were strengthening the chain binding Chicago to the field of visual education, for they enlisted some of the same professors who had participated in the early organization of the Society for Visual Education. The same chain of circumstances added more links, two years ago, with the organic connection between Encyclopaedia Britannica (owned by the University) and Britannica Films, Incorporated, which purchased Erpi and Western Electric's film interests and took over the Eastman Teaching Films.

In fact before my visit with Mr. Greene had ended, my personal problem had been solved. I realized that all of these people and firms would welcome us to Chicago. I was ready to trade my native islands for the mainland.

## Precision Brings Pacific Victories

Aimed with deadly precision, aerial torpedoes have been a decisive factor in Pacific victories.

Early in the war, U. S. Navy Torpedo Squadrons launched their "tin fish" by diving in dangerously close to their target. The risks were great—but they sank plenty of Jap ships.

The problem in this type of attack is to estimate the distance to the target and the speed of the target. He must aim—not where the ship is, but where it will be when the torpedo strikes.

To solve this problem, he uses a Torpedo Director in which an enemy ship

can be centered easily and quickly.

The Torpedo Director is one of many scientific optical instruments being produced by Spencer Lens Company to speed Allied victory.

# SCHOOL MADE MOTION PICTURES

**HARDY R. FINCH**, Editor  
 Head of the English Department  
 Greenwich High School, Greenwich, Conn.

“SO You’re Going to Make a Movie” is the title of an informative article which appears in the second issue of *Techniques*, a publication of the School Public Relations Association. B. I. Griffith, assistant secretary in charge of public relations for the Ohio Education Association is the author.

“IF YOU’RE going to make a movie, far be it from our purpose to discourage you,” Mr. Griffith writes, “A good motion picture is one of the most effective ways of presenting ideas, of stirring the emotions, of moving people to action. Motion pictures should be included in the program of public relations. But before you launch out on a project of making a motion picture, give the proposition careful consideration. You may be surprised at the amount of planning, work, and money involved in what seems to be a simple motion picture fifteen minutes in length. . . .”

After discussing the questions which every school movie maker should ask himself regarding the purposes and costs, Mr. Griffith advises the educator to “get all the professional help” he can afford. “At least

*With a question box on the making of school film productions, conducted by*  
**DAVID SCHNEIDER**  
 Evander Childs High School, New York City

hire someone who knows how to write the scenario or script.”

Selected details from Mr. Griffiths’ article follow:

“Have the scenario written early, in fact do that first, before you expose a foot of film. It is a temptation to take a camera and start shooting, with the vague hope that the shots can be spliced together in a sequence that will tell a story. The beginner, with amateur experience in taking home movies which seem interesting, usually is guilty of starting out with a camera and film to get some school shots—the physical education class, the sewing class, a project in woodshop, etc., hoping that an interesting school picture will result. If you proceed on this basis, you are wasting time and film and, what is more serious, your public will be bored by the results.

“The secret of a good movie is a good script, If at all possible, have this written by a professional writer of movie scripts. Writing a scenario is a highly specialized art. There are many tricks to the trade.

“How will you find a professional writer? Ask a professional producer of public relations or educational film. A manager of one of your local movie houses may be able to help you find a writer. An acquaintanceship exists between writers for radio and writers for modern pictures. Your local radio station perhaps can suggest a person to write your scenario. Before selecting a writer, screen one or more pictures that he has written; interview him as you would a prospective teacher; if he seems suitable, ask for a preliminary outline of a picture such as you intend to produce.

“It is suggested that signatures to a release form be secured from the persons appearing in the picture or, in the case of minors, from their parents. The release form is a simple statement to the effect that the undersigned grants permission to . . . school to exhibit their picture. There is only a very small chance that objections will be made by an individual to the use of his picture, after he has consented by posing for the camera, but there is always the possibility.

“A definite shooting schedule should be worked out such as scenes 21, 80, and 81, in Room A at 3 P.M.; scenes 19, 30, 31, at girls’ gym, 9:30 A.M., November 10. All persons involved should be present at the time scheduled. Teachers involved usually will have ideas about how the scene should be arranged, and set projects to be included. The director should listen, be as cooperative as possible, but firm. He is the one who knows what must be included in the scene. Allow thirty minutes for photographing each scene. The scene may take only five seconds on the screen but it will probably take thirty minutes to set up the lights, camera, arrange the properties, rehearse, take, and retake. . . .”

“If the picture is to have a sound track recorded, you will need the services of a sound laboratory. It is well to rely on its advice in making the recording. It is suggested that in selecting the sound laboratory you use the same procedure as that of selecting a writer. Ask the privilege of screening one or more pictures that they have made in order to determine the quality of their service. It is highly recommended that the services of a professional announcer be used for the voice track. . . . Do not expect one voice to hold the audience for fifteen or twenty minutes without interruption. Work for variety, use sound effects, music, and possibly two voices to secure variety. The laboratory will synchronize the sound with the picture and make prints. It is strongly advised that the whole job of editing be turned over to the film laboratory.”

## QUESTION BOX ON FILM PRODUCTION

**QUESTION:** I photographed a series of titles on black and white reversal film. When the reel was returned to me after processing, I found the titles white and sharp, but the background was a light grey, thus cutting down the contrast I had hoped for. I used white lettering on a blue title board. Could you please tell me what I should have done to have obtained the desired contrast?

**ANSWER:** If you consult the specifications of orthochromatic as well as panchromatic films you will find that both are highly sensitive to blue light. This means that the color blue of the background registers on the film as a lighter color (nearer to grey) than what the normal eye sees.

In order to have obtained the desired contrast in your titles you should have followed any one of the three procedures:

1. For a darker grey background—underexpose either by moving the lamps further back from the title board, or cut down the diaphragm opening one or two stops.
2. For a black background—paint your title board with a dull, flat black paint, or in case you wish to save the blue for future color work, cover the board with black paper or cloth.
3. Prevent the blue light from entering the film. This can best be done by slipping a deep yellow or red filter over your lens. Either filter has the power of absorbing a great deal of the blue light and so render the background darker. You must remember, in connection with the use of filters, that the diaphragm openings must be increased from one to three stops (depending on type of filter used—filter factors are supplied by manufacturers). This is to compensate for the loss of that portion of light which does not enter the film.

## The Curriculum Clinic

(Concluded from page 427)

*Policeman* (10). On the regular shift of a typical city patrolman. Use of motorcycles and patrol cars with radios, lessons in traffic safety, rescue work, and arresting a speeder.

*Robin Redbreast* (10). Tells the story of a robin family. The development of the young in the nest is depicted from hatching to maturity. A wandering cat is chased away by the parent birds. The calls and notes of the birds are reproduced.

*Sawdust Sidelights* (8). The Ringling Brothers Circus in winter quarters. Equipment is being made ready, animals undergo their training, star performers rehearse under the open skies.

*Shep—The Farm Dog* (10). We follow a collie dog during his busy day around the farm. Herding the cows, routing the chickens from the garden, swimming, chasing a woodchuck, playing.

*Teddy Bear's Picnic* (6). The antics of Australia's lovable Koala bear at play, wrestling with other bears, hopping along the ground, and climbing trees.

*Ten Age Farmhand* (10). (Color). A day with Ken, typical farm boy, tending chickens, collecting eggs, driving a tractor, feeding and raising pigs, milking cows, harnessing horses, and baying.

*Three Little Bruins in the Woods* (10). Shows how three little bear cubs through their wanderings in the woods look in upon such other forest dwellers as the skunk family, the fox family, turtles, and fish. It gives a good overview of the animals of the midwestern woods. The commentator is apt to become just a little adult by inserting several puns.

*Three Little Kittens* (10). When about two weeks old, the kittens are carried by their mother from the barn to an old buggy, where they learn to feed and clean themselves. Later they skirmish with a dog and learn to hunt.

# Threefold EDUCATIONAL SERVICE

offered by  
**ENCYCLOPAEDIA  
BRITANNICA FILMS**

## Authenticity of Subject Matter Assured

Because the authenticity of all material presented is safeguarded by the collaboration of outstanding authorities and subject-matter specialists, Encyclopaedia Britannica Films offer educators the most authentic classroom film library ever produced to meet the demands of the school curriculum.

## Correct Film Selection Assured

To help you properly select Encyclopaedia Britannica Films for your school system, we prepare, without obligation, an Integration Study after duly analyzing your school syllabi or courses of instruction. With this individualized Integration Study before you, you can systematically build an Encyclopaedia Britannica Film Library to fit your courses of instruction.

## Proper Film Utilization Assured

When Encyclopaedia Britannica Films are introduced into your school system, our Film Utilization Service at once plays an important role. Highly trained teachers, selected for their comprehension of modern instructional problems, explain the techniques of using Encyclopaedia Britannica Films as an instrument for dynamic classroom instruction.

*Write for descriptive booklet without obligation*

## The Improvement of Audio-Visual Materials

(Continued from page 423)

or "aid" which he is promoting but sees these materials as teaching tools to effective learning.

Fourth, and of great importance, Los Angeles has been blessed with a Board of Education and a Superintendent, Dr. Vierling Kersey, who are thoroughly convinced of the practical time-and-money-saving contribution that audio-visual education is making.

## A Bruce Findlay Booklet

OUR thanks, and our readers', are due to Edgar Dale for the above picturesque summation of some of Bruce Findlay's constructive ideas. It is an interesting report of one expert to another. Following such a dialog between authorities seems as good a place as any, in fact better than most, to subtend a bit of evidence that Bruce Findlay does not limit himself to the mere formulation of ideas. He puts them into action. Witness the recent imprint from the Los Angeles City Schools, bearing the formal title in small print, "School Publication No. 395," but made quite informal by the very Findlayesque title in large print,—"Audio-Visual Aids that Teach for Keeps."

Too many visual instruction bureaus in the country, large or small, content themselves with periodic publications merely perfunctory in content and purpose. They offer the usual "general directions," "observations," "terms of service," followed by elaborate listings, alphabetically or otherwise, of their mass of materials—the whole composed largely of standing type from previous editions. Such catalogs are eminently utilitarian but scarcely inspiring or even promotional. They are invaluable as reference sources for teachers already inoculated with the visual-teaching virus and who need only facility for finding what they want, not a stimulus to want it. They serve the veterans well but win few recruits to the audio-visual ranks.

The Findlay booklet uses no standing type. It is new creation, seventy two pages of it. It is fresh, stimulating propaganda—in the finest original sense of the word—aimed at winning converts, prodding laggards, and stirring even the best teachers to higher efficiency. The first fourteen pages seek to make clear "What This is All About." It is done crisply, journalistically, with short, incisive paragraphs, and more than fifty bold-type sub-heads in the fourteen pages. It seems an obsession with the author to provoke maximum thinking with minimum wordage. The introduction nettles attention, builds up interest, flings out a thesis, proposes to prove it, and makes the reader want to see the proof. It declares that teachability can be built into visual materials and that right technique can assure participation by the class. (The Los Angeles Department has already produced films and film-strips along these lines).

Then the booklet turns strictly and emphatically to the business in hand. "The Application of Participation Techniques" with all kinds of audio-visual media. It is through with generality and precept. It details exact procedures for specific topics—forty eight in all!

An inspiring presentation of the American way of life . . . portraying the hopes of the immigrant upon approaching our shores, his aspirations and his contributions to our culture. Beautifully photographed . . . significant . . . a MUST for school audiences. Available for rental and sale.

**CHANTS POPULAIRES Series  
French-Canadian Folk Songs  
with Animated Cartoons**

Five delightful 16mm. sound shorts, one reel each. Sung by the Alouette Quartet in French.

No. 1 "En roulant ma boule" and "A la claire fontaine"

No. 2 "Envoyons d' l'avagant nos gens" and "Aupres de ma blonde"

No. 3 "La-bas sur ces montagnes" and "Trois canards"

*Walter O. Gutlohn Inc.*

ENTERTAINMENT SOUND FILM SILENT EDUCATIONAL

25 West 45th Street Dept. E-12 New York 19, N. Y.

19 So. LaSalle St., Chicago 3, Ill. • 4247 Piedmont Ave., Oakland 11, Calif.  
302½ So. Harwood St., Dallas 1, Texas

The forty eight examples show how class participation is achieved with all the familiar aids (lantern slides, sound and silent filmstrips, sound and silent motion pictures, charts, maps, prints, phonograph records, electrical transcriptions)—in many subjects (posture, penmanship, language, arts, chemistry of foods, geography, safety, planning kitchens, etiquette, job ethics, human relations, vocabulary, auto mechanics, orchestral instruments, electricity, home economics, conversation, fractions, character education, weather, history, or what have you?)—for various aspects of teaching techniques (analysis, comparison, criticism, discussion, identification, missing item, problem solving, relationship, selective recall)—and, finally the forty eight apply to four levels of High School, Junior High School, Upper Elementary, Lower Elementary, twelve examples for each. A bit bewildering, all that? Only in our streamlined summary, not to the teacher using the booklet. For each example is concerned with the use of a single visual aid, on a single topic, under a particular technique, and at one level only. If a teacher knows what he is teaching he can find examples that fit a given situation.

Other pages describe the author's idea for implementing the teaching value of a film by the "Leader for the Leader." Other pages itemize procedures for "Testing Techniques" by comparison, completion, false-true, matching, multiple choice, one-word answer, rearrangement, and wrong-right responses. Finally, a complete scenario, "Stop It," exemplifies the Findlay idea of an educational motion picture with the participation technique fully built-in.

We need hardly point out that not all will agree with all of Bruce Findlay's pronouncements, arguments, and evidence. Fortunately he will provoke plenty of disagreement on details. We say "fortunately", for otherwise one man would suffice to do all the thinking for the field—from which may the Good Lord deliver us! But, regardless of arguable details, the total impulse of this little book is powerfully and unmistakably forward. It is a thrust in the direction in which visual instruction should move and therefore a real contribution to progress in our field. We are authorized to state that copies of "Audio-Visual Aids that Teach for Keeps", at 50 cents each to cover costs and handling, will be mailed to teachers anywhere, while the small surplus lasts.

N. L. G.

**The Film and International Understanding**

(Concluded from page 428)

which can so easily surmount the barriers of difference in language or illiteracy. It is one type of film which can penetrate practically every corner of the world with its message.

There is no set form or pattern which it must follow. It can be long or short. It can stand on its own feet independently, or it can be coordinated with a motion picture, as already has been done in some instances. It is so inexpensive that practically any group can use it to present its message.

The chief problem is one of technique, in both preparation and presentation; and *How to Conquer War* has shown how technique can be adapted and used effectively in this field.

# The Literature in Visual Instruction

## A Monthly Digest

ETTA SCHNEIDER RESS, Editor

### ADMINISTRATION

- **State University Makes Films and Teaches Schools How Best to Use Them**—Bruce E. Mahan, University of Iowa *Nation's Schools*, 34:53 October, 1944.

The Bureau of Visual Instruction of the University of Iowa Extension Division has long operated as a lending library. It handles 3,000 reels on 1,500 subjects, and this number continues to increase. The Bureau has also been serving as film producer for at least seven departments of the University. The Iowa Child Welfare Research Station has made a few films; the Bureau of Dental Hygiene has a film; the Department of Physical Education made one film on posture for poise, among others; the College of Education has a film on the art and science of teaching; the Department of Industrial Engineering has made films on time and motion study; there are other films sponsored by the college of medicine and some for public relations.

The Bureau furnishes advice and workshop training to teachers of the state. State conferences in five cities were held for teachers and administrators to promote greater interest in the use of films. Demonstration lessons were taught in each city with 15 boys and girls from the fifth or sixth grade.

- **Educational Films in the Library**—Walter A. Southern, University of Wisconsin—*Wilson Bulletin*, 19:130 October, 1944.

Some of the functions of a librarian in disseminating information about educational films, or in handling films for circulation.

### UTILIZATION

- **Visual Aids in a Language Arts Program**—Victor Coles, University of Cincinnati Teachers College—*Elementary English Review*, 21:256 November, 1944.

Flat pictures are the most easily available, and are therefore the best type of aid for enriching the language arts program. They must meet the recognized criteria of authenticity, relevance, good technical quality and attractiveness.

One method of use is to have the children find picture words that describe the scenes shown—gloomy, steep, glittering, etc. A suggested follow-up for this exercise would be to listen to a poem and select word pictures. Scenic movies may be used as a basis for giving objective tests with picture words. As, find the word (choice of 4) that best describes this region. Lantern slides, both photographic slides and handmade slides lend themselves to a variety of uses.

Enrichment in language arts would include these and many other experiences that build up experimental backgrounds and thereby improve word understanding. First-hand experience with different types of materials and with odors are a few suggested methods.

- **The Use of Film Material in Studying Peoples**—Gregory Bateson, Council on Intercultural Relations—*Junior College Journal*, 14:427 May, 1944.

The article states the principles that should govern the use of films to teach a foreign civilization. The criteria for selecting such films should be: 1) They should be products of the region being studied. Moreover, they should have been planned, made and edited by the people of that region for audiences of the region. This would exclude documentary films made by a visiting film unit, among other types. It would include scenic or industrial subjects made within a given country. 2) The films used should, if possible, have been successful in the country of origin.

In using films, the instructor must be sure that they are not merely a spectacle. They must provoke thought and discussion. A film can help us to understand and appreciate the culture about which we have read or heard. For example, a review of films made in Germany since 1919 provides a pattern of German thought and actions over a period of years.

For some countries, as France, Germany, Britain, Holland and others, there are at least five films that would meet the criteria. There are probably no suitable films from Norway, Denmark, Bulgaria, Albania, Siam, Yugoslavia and North African countries.

- **Audio-Visual Business Education**—E. Dana Gibson—*Business Education World*, 25:141 November, 1944.

A good digest of the criteria and teaching principles that are necessary before audio-visual aids can be used properly. Although intended for teachers of business subjects, this article is generally applicable.

### EXHIBITS

- **Visual Aids from the Historical Society**—Milton W. Hamilton, Berkshire County Historical Society, Penn.—*The Social Studies* 35:313 November, 1944.

The Historical Society of Berks County, Reading, Pennsylvania, is one of the largest local historical societies in that state. Since few children are able to make use of the excellent library and museum collections of the Society, a new service has been initiated, that of circulating loan kits.

The loan kits contain realia about a subject of study, and include an explanatory booklet. Some of the subjects treated are: early methods of lighting, colonial kitchen utensils, early money, etc.

From its collection of old and rare pictures the Society has prepared standard lantern slides which are loaned in sets, on such topics as old houses, covered bridges, and our community in the nation's wars. Used half-tone plates of illustrations that have appeared in the Society's magazine have been prepared as sets of plates to be used in the classroom as illustrative of historical events.

- **Interpret Your School by Means of Exhibits**—Paul D. Fintus and Floyd W. Hoover—*Clearing House*, 19:8 September, 1944.

One reason why exhibits of school activities should attract attention is that parents are interested at least in the work of their own children and like to have their children receive recognition.

In addition to exhibits displayed at school, there are other good suggestions for the location of exhibits: store windows, hotel lobbies, community halls, county or state fairs, conventions, and the like.

The pupils should plan the exhibits, many should participate and be represented, the names of students shown wherever possible. Make the display simple and unified. Get advance publicity to assure an audience.

### DIORAMA

- **Three-dimensional Learning**—Irene F. Cypher, American Museum of Natural History—*Nation's Schools*, 34:52 September, 1944.

A review of the possibilities of the diorama when properly used for education. The author has had considerable experience in the use of expensive, authentic dioramas at the Museum, has observed children's reactions to them, and has also promoted instruction in building dioramas.

The best dioramas are usually expensive because they require a high degree of craftsmanship in construction. There is no need for large exhibits; miniatures have been found to

# New Brilliance Depth and Color To Your Projected Pictures

When they are projected on Radiant Hy-Flect Glass Beaded Screens instead of old, faded models and makeshifts.

Thousands of tiny glass optical beads firmly imbedded in the snow white plastic surface of the improved Radiant Screens make the startling difference. These beads *reflect* light instead of absorbing it. The results—black and white motion pictures, slides and slide films show up vividly and clearly with sufficient contrast. Colors take on new depth and brilliance. Student attention and interest is more effectively maintained. Visual aids become more efficient when used with these perfected Radiant Screens.

### Radiant Portable Models Offer You:

In addition to the Hy-Flect Glass Beaded Screen Surface—you will find many innovations, special conveniences and unique advantages in Radiant Screens. These include:

- 1. Automatic Clutch.** A positive device that permits instant raising and lowering of screen housing without the necessity of manipulating screws and bolts. So simple and easy to operate a child can use it.
- 2. Quick Tripod Release.** Tripod legs may be opened or closed quickly. They

support the screen in *any* position for wide or narrow spread without set screws or plungers.

- 3. Auto-Lock.** (Pat. applied for.) Just touch convenient button for raising or lowering center extension rod and screen instantly.

- 4. Convertible from Square to Oblong—**for movies, stills or slides, Radiant square sized screens are convertible to oblong by merely raising screen to indicated position.

The Radiant Screen here illustrated is Model DS—a portable Metal Tripod Screen—sturdy but light, compact, easily set-up, and is quickly adjustable. Available in sizes from 30" x 40" to 52" x 72".

The Radiant line of screens—specially designed for schools and institutions—also includes a complete range of wall, wall and ceiling, and table screens from 22" x 30" to 20 feet by 20 feet and larger.

be equally effective. A good diorama should have an effective background, curved is preferable. Figures should be modeled of wax or clay for thickness. An electric light inside the case improves visibility. Motion was found to detract from the diorama's effectiveness, because then it becomes a gadget or toy.

Pupils and teachers have been given instruction with good results in the building of habitat groups. Skillful teaching is necessary, even for the best diorama, and its maximum usefulness is yet to be explored.

### MAPS

- **Teaching Geography in an Army Air Force College Training Program**—W. Seward Salisbury, State Teachers College, Oswego, New York—*Social Education* 8:265 October, 1944.

This article describes the professional growth of a group of college teachers engaged in teaching a pre-flight aviation student unit under the Army Air Forces, one of about 150 units throughout the country.

The Air Forces prescribed the course of study for each of the subjects, e. g. physics, mathematics, geography and so on. But the methods of instruction were left to the discretion of the college faculty.

In geography, nearly half of the class activity tended to be in map interpretation. Students had to know definitely the concepts involved in understanding the globe, latitude, longitude, time relations, etc. Students had to prepare map projections and transpose projections from one type of grid to another. Other units in geography taught through maps were weather, and regional geography.

The faculty found this army program to be a challenge. Experimentation was especially needed in the use of teaching aids. For example, in some instances the most expensive devices were less effective than those obtained free—or especially made by the staff.

### SOURCES

- **Aviation Film Directory**—Air Transport Association of America, 1515 Massachusetts Avenue, N. W., Washington 5, D. C., 62p. October, 1944.

A complete listing of 16mm. films and slidefilms suitable for general, preflight and technical groups as a basis for promoting air-mindedness after the war. For each title there is a brief description, with information as to producer ((or sponsor) and sale price.

In the introduction the Association states there is still a great need for films dealing with the broader aspects of aviation, to make the general public air-minded. Army and Navy training films, as well as commercially-sponsored films are included in this extensive bibliography.

- **Our Forest Resources and Its Conservation**—a new bibliography of study aids relating to American forests distributed by the American Forest Products Industries, Inc. to thousands of schools throughout the country. Last year, this program of education on forest resources and problems was used by more than 10,000 schools of the United States.

This year's bibliography presents several new items designed especially for instructors and school libraries. A five-color booklet graphically describes methods by which forest industries can assure the country of adequate forest resources for the future. These same subjects are also available in poster form.

A series of three booklets in classroom quantities is offered. Other wall charts and posters, a forest facts quiz book, other illustrated pamphlets and motion pictures are listed. All of this material is provided without cost. A copy of the illustrated bibliography may be obtained by writing American Forest Products Industries, Inc., 1319 Eighteenth Street, N. W., Washington 6, D. C.

## School-and-Institute Cooperation in Philadelphia

The Franklin Institute, Philadelphia, Pa., one of the oldest institutions in the country devoted to the study and promotion of the mechanic arts and applied sciences, is co-operating with the Philadelphia Board of Education in correlating facilities of the Institute with the school curriculum. The Institute's department of museum education broadcasts two popular science programs directly to classrooms, and the Board of Education has assigned one of its representatives to work in the department, to conduct tours of the museum, and to give lectures before faculties and student bodies at the schools.

The two radio programs, "Science is Fun," designed for the elementary grades, and "Great Moments in Science," adapted to junior and senior high school students, are broadcast weekly. They are supplemented by teachers' manuals containing a synopsis of each program, bibliographies, suggested activities and lists of materials for classroom demonstration during the broadcast.

Miss Mabel G. Rhoads, a teacher with several years experience in correlating museum facilities at the Commercial Museum with the school curriculum, was designated for the new Franklin Institute post by Dr. John C. Garman, director of the department of visual education of the Board of Education. In addition to giving lectures at the schools, she also interviews individual teachers on the particular use each can make of Museum and Planetarium facilities at The Franklin Institute.

## New Jersey Holds Annual Visual Meeting

The New Jersey Visual Education Association conducted its annual program at the American Museum of Natural History in New York City on Friday, November 10. A panel discussion of "The Practical Utilization of Teaching Aids in Our Schools" occupied the morning hours. Mr. V. C. Arnsperger of Encyclopaedia Britannica Films opened the afternoon session with a talk on "Visual Instruction at the Threshold of a New World." He was followed by Major Dennis R. Williams, Army Pictorial Service, who described the "Utilization of Audio-Visual Aids in the Army Training Program," and Dr. Herbert J. Stack, Director, New York University Center for Safety Education, whose topic was "The Sound Film as a Device in Safety Education." The talks were accompanied by the projection of visual material.

## Visual Aids Featured at Medical Convention

The value and possibilities of visual education received highly significant recognition recently when some 2,200 members of the American Academy of Ophthalmologists and Otolaryngologists met during October at the Palmer House in Chicago. Leading professional organization for physicians and surgeons specializing in eye, ear, nose, and throat practice, the Academy habitually devotes most of its convention time to instruction of its members, and this year's

# Tales

meeting reached a new high in the use of visual aids. With 30 classrooms equipped for the convenient use of visual aids, good use was made of motion pictures and slides in demonstrations and instructions. In addition, there was a daily general session devoted to mass instruction, at which an average of 1,200 persons viewed films projected by the Filmoarc machine. The Academy plans to expand its motion picture program to include the production of films to be available to the general public. Such enthusiastic recognition of visual teaching materials by the country's leading eye specialists serves to underscore even more vividly the growing importance of visual education to groups and individuals alike.

## Indiana University Reports

Evidence of what can be done through consistent effort in promoting audio-visual education is contained in the annual report of the Bureau of Audio-Visual Aids of Indiana University, Bloomington. Mr. L. C. Larson, director, reports informally that their bookings so far for 1944-45 top those of last year by more than 50 per cent. Of interest is the fact that these, in turn, were increased over 1942-43 by 33 1/3 per cent.

While the work of the Bureau is for the most part confined to the state itself, innumerable requests are being received from other sections of the country. Records of the Bureau show a total number of bookings, in all categories of visual aids, of 21,866 for the year ending June 1944. Comparing the school year 1943-44 to 1942-43, the records display a distribution of 28,844 reels of sound and silent films for 1943-44 to 22,251 for 1942-43.

## New Corporation in the 16mm Industry

International Theatrical and Television Corporation has been organized by George A. Hirliman and a group headed by Eliot Hyman, president of Microstat Corporation, to develop the 16mm field to its widest potentialities and to augment it by eventually tying in the practical application of television as well. The new organization plans to manufacture and market, at moderate prices, its own 16mm projector and television equipment in four different models, ranging from home to auditorium use, and to open within the next few months 16mm branch offices for the sale of projector equipment in addition to distributing its 16mm pictures. Territorial franchises throughout the United States and the world will be available with deals already pending for the United States, England and several Latin American countries. Negotiations with General Aircraft Equipment Company for the manufacture of 16mm projectors and television equipment are now in the process of completion. Circle Film Laboratories will be affiliated with the new company for the express purpose of handling the new company's laboratory printing.

In order to devote all his efforts to the new project, Mr. Hirliman, currently President of Film Clas-

**Cleveland Survey of Visual Aids Circulated**

The Circulation Report of Visual Aids for the school year 1943-44, compiled by the Division of Visual Education, Cleveland (Ohio) Public Schools, contains some figures worthy of note. For instance, 120 Cleveland elementary and high schools, from September through June, booked a total of 24,488 films—12,549 silent and 11,939 sound—consisting of 1,007 silent subjects and 1,070 sound subjects. This represented an average of 144 films circulated daily and an average of 204 films booked and circulated to each of the 120 schools. Based on an average of four showings per week per film to different class groups, and forty pupils at each showing, the school film audience totalled 3,918,080 pupils.

It is estimated that the total cost per pupil per showing of a silent film is 3/8 cents, and 3/4 cents per pupil for a sound film.

Other data are given on the amount of visual aid materials available for circulation, the number of films accessioned each year since 1929, number of silent and sound film titles in each teaching area, and the number of films booked by each individual school.

**M.O.I. Making Films for Education Ministry**

Five training films for the British Ministry of Education are being made by the Ministry of Information, according to an announcement in the English film magazine, *Kinematograph Weekly*. These are part of a series of about a dozen films, which will be available free through the Central Film Library while the present wartime organization remains in force.

The M. O. I. announced that the object in making the series has been to experiment in various fields rather than to give the program a unity by itself. "The first five films which are already under way are all of a general type, not limited to a classroom subject in the narrow sense", it was stated. "The first, *Child Study*, is intended for use in teaching training centres, but it is hoped that it will be of interest to parents' associations and wider audiences.

The others are designed for senior and secondary schools and adult audiences. They are: *Local Study*, a film to illustrate how the geographical, historical and sociological conditions of a given area, rural or urban, interact to produce its special character and lines of growth; *The House You Live In*, suggesting how the changing ways of life of different ages have been responsible for the character of English architecture; *Pre-Roman Britain*, a study of developing human life in Britain before the Roman conquest; *The Orchestra*, a study of the families of musical instruments.

"The Minister of Education is convinced that in many instances these films should not be allowed to stand alone, but should be supported by a variety of material, such as photographic and other exhibits, film strips and printed matter, all designed to follow up and enlarge upon special topics arising from the films."

### Proposed Standards for Microfilm

Because of the rapid growth of microfilming as a result of the war, many sizes and kinds of film have been used. As a guide toward sound usage, Subcommittee 7 on Printing and Projection Equipment of the ASA Sectional Committee on Standardization in the Field of Photography, has prepared new proposed standards on microfilm and microfilm readers and is asking for comments and criticisms from users of microfilms to aid them in the final revision. The proposed standards include current practice and focus attention on controversial issues.

Copies of the Proposed American Standard Practice for Microfilms, Z38.7.8, and of the Proposed American Standard Specifications for Microfilm Readers, Z38.7.9 can be obtained from the American Standards Association, 70 East 45th St., New York 17, at 10 cents each. Any information bearing on these standards should be sent to the Association or to the chairman of the committee, Mr. O. W. Richards, Spencer Lens Company, Buffalo, N. Y.

### The Arts of Wartime Visualized—Editorial

(Concluded from page 421)

ter Picture on silk, breathing China's mystic philosophy (1100), and the Crocodile God in relief on a golden disk from Panama (1000). We cannot resist thinking Geography, Ethnology, Social Science before such objects as hand-woven costumes from Mindanao, the Netherlands, Guatemala; rich weavings from Iran and Poland; rare old pottery and porcelain from Nicaragua, Denmark, El Salvador; portraits and statues from Yugoslavia, the United States, Czechoslovakia, South Africa, Norway, Greece, Costa Rica; landscapes and village scenes from Australia, Belgium, Canada, Brazil, Haiti; and, finally, from 1500 years ago in the Americas, the Head of Man, of the Tiahuanaco classic period in Bolivia and the Head of a Maize God from the Mayan city of Copan in Honduras, both showing Mongoloid traits and strengthening further the evidence that the Aborigines of America crossed the Behring Straits to reach their final home. It is a small exhibit, indeed, but it is beautiful, unhurried, quiet, infinitely patient while the visitor achieves his visual education. We liked it.

**FILMATIC**  
TRIPLE-PURPOSE  
FILM-SLIDE PROJECTOR

*GoldE*

MOTOR DRIVEN  
FORCED AIR-COOLED

NO REWINDING  
NECESSARY

FINEST LENS  
OF ITS TYPE

**3-WAY USE**

- 2 x 2 Paper or Glass Slides
- Single Frame Slidefilm
- Double Frame Slidefilm

**Instantly Set up**  
Corrected Lens—Can Be Cleaned Easily  
Film Loops Naturally ... Will Not Scratch  
Conveniently Portable—Yet Very Stable

It's easier, more economical to use this versatile 3-in-1 projector. Gives more illumination per watt—assures perfect clarity of image. Can be changed from film to slide showing—in a jiffy! Modern design. Has Manumatic slide carrier—Kwik-Lok spiral focusing—smooth tilting—fingertip control—accurately centered optical system. 300 watt lamp capacity. Complete with custom-built carrying case.

*GoldE*

**AIR-FLO STEREOPTON**

FOR LONGER DISTANCES

FOR COOLER OPERATION

LAMP CAPACITY UP TO 1000 WATTS

**Forced-Air Cooled**  
**Adjustable Bellows**  
**Built-in Tilting Device**  
**All-Steel-Welded Construction**

Another GoldE advancement in stereopticon design! This modern, trouble-free Stereopton withstands constant operation—heat absorption filter gives slides added protection from heat damage. Precision optical system uses the finest ground and polished lens. (Choice of 3, from wide range). Shows standard 3 1/4" x 4" slides. Compact—conveniently portable.

Above Items Now Available on MRO Ratings to: Educational Institutions—Army and Navy—Maritime Bases—War Industries—Government Agencies—Medical Professions, etc.

Designers and Manufacturers of Light Projection Equipment

# Current Film News

■ WALTER O. GUTLOHN, INC., 25 W. 45th St., New York 19, offer a timely color film in their new one-reel sound release:

**Liberty**—a dramatic presentation of the American way of life. This beautifully photographed motion picture portrays the hopes of the immigrant upon approaching our shores, his aspirations, and his contributions to our culture. Liberty documents the contrast between the foreign "isms" and the democracy we enjoy, and shows the need for a better understanding of the peoples who make up our nation.

A series of five films featuring French-Canadian Folk Songs combined

with animated cartoons has also been released by Gutlohn. The titles of these one reel shorts are:

**Chants Populaires No. 1:** "En roulant ma boule" and "A la claire fontaine"

**Chants Populaires No. 2:** "Envoyons d' l'avant nos gens" and "Aupres de ma blonde"

**Chants Populaires No. 3:** "La-bas sur ces montagnes" and "Trois canards"

**Chants Populaires No. 4:** "Filez, filez, o mon navire" and "J'ai tant danse"

**Chants Populaires No. 5:** "Je m'en-fouyais" and "C'est l'aviron"

The songs are sung by the Alouette Quartet in French and range from 16th Century favorites to popular present-day folk songs. They are available on rental and sale basis.

■ BRITISH INFORMATION SERVICES, Film Division, 30 Rockefeller Plaza, New York 20, announce the following list of new 16mm sound films for loan at a small service charge, as well as for sale:

**Looking through Glass** (18 min.)—manufacture of glass in one of Britain's factories, where the handcraftsman still applies his art alongside modern, mass-production methods.

**Second Freedom** (17 min.)—showing benefits derived in Britain from Social Services instituted by the Government.

**Hospital School** (11 min.)—a detailed description of the largest among hospitals of its kind in the British Isles

devoted to the care and cure of crippled children.

**Country Town** (16 min.)—presenting a day in one of Britain's market towns whose history dates back to the 7th century.

**Warfront British No. 1 and No. 2**—two one-reelers covering new and varied subjects.

■ ENCYCLOPAEDIA BRITANNIC FILMS, INC., 1841 Broadway, New York 22, have made available a third film in their series of Home Economics laboratory demonstration studies, namely:

**Principles of Home Canning**—designed for use in junior and senior high school classes to encourage practices of home economy during the war period. In addition to teaching the scientific principles governing all operations in the canning process, and the effect of each principle in operation, the film provides a rich background of learnings that apply to the home studies, including planning the home budget, safety measures, and economy in the use of efficient procedures and proper materials.

A Home Economics Catalog listing Erpi Classroom Films in the fields of foods and home making is now available upon request to Encyclopaedia Britannica Films Inc.

■ BELL & HOWELL CO., 1801 Larchmont Ave., Chicago announce the acquisition of the feature, entitled:

**Courageous Mr. Penn**—9 reels—a stirring historical drama showing the struggle for religious and civil liberty in England under Charles II, and the founding of a free, peaceful commonwealth in Pennsylvania. William Penn is shown as a fearless Quaker who defends himself magnificently before arrogant, corrupt judges by winning the jury to his side. His part in founding his colony, and its peaceful relations with the Indians is also brought out. A study guide accompanies the film.

Scene from "Courageous Mr. Penn"

## New Catalogs

Two new annual catalogs of interest to consumers of 16mm films have made their appearance. Both are published by Films Incorporated, 330 W. 42nd St., New York 18, and present their 1944-45 film listings.

The first catalog, the *School List*, is a compilation of 16mm feature-length motion pictures which have been selected by a board of high school principals, teachers and university lecturers for presentation in the school auditorium. These films possess educational worth in addition to their entertainment value. Feature films are furnished with one or more short subjects dealing with art, biology, civics, comedy, economics, geography, history, news, physics, psychology, sports, etc. Study Guides have been prepared by professional educators for most of the *School List* features.

The other catalog, *Major Productions* tabulates 16mm features and short subjects produced by the major Hollywood studios, which are also available from Films Incorporated.

These two publications offer a wide variety of film material in interesting and attractive form, color and illustrations from the films being used liberally.

▲ ▲

The Harmon Foundation Films have been taken over for distribution by the Religious Film Association, 297 Fourth Avenue, New York City. This Association has also made arrangements with the Y.M.C.A. Motion Picture Bureau to distribute these subjects, and others, through Y.M.C.A. depositories in New York, Chicago, San Francisco and Dallas, thus making the films more accessible to churches throughout the country. Churches are requested to continue to book desired films through their denominational agencies which are members of the Association.

A revised edition of its visual aids catalogue has been issued by the Religious Film Association. Consisting of 80 pages, the catalogue lists filmstrips and Kodachrome slides, as well as motion pictures.

# AMONG THE PRODUCERS

## Ervin N. Nelsen, Educator, Joins Ampro's Staff

Ampro Corporation, Chicago, takes pleasure in announcing the appointment of Ervin N. Nelsen, for five years supervisor of visual education in the St. Louis Park Schools, Minneapolis, Minnesota, as Educational Sales Director of the company.

Mr. Nelsen comes to Ampro with a thorough knowledge and understanding of the field of visual education in the elementary and secondary schools, and

Ervin N. Nelsen

a keen appreciation of the future possibilities of visual education and the vital part it does and will play in both the industrial and educational fields. His background suits him well for the position which he fills. As principal, teacher and supervisor of visual instruction in various schools for the past ten years he is familiar with the viewpoint of the educator, yet his work in this special field has not been confined alone to formal education, having also spent considerable time in industry where he has supervised the production and national distribution of various visual aids materials.

The program which Mr. Nelsen has organized and developed at St. Louis Park, Minneapolis, is considered by many educators as outstanding in the country. He will be glad to be of assistance to educators in the formulating of their visual programs.

## William Bausch Dies at 84

William Bausch, board chairman of Bausch & Lomb Optical Company, Rochester, New York, and last surviving son of John Jacob Bausch, founder of the company, died last month. This was the second time death came to the Bausch family within a few months, the death of his

brother, Edward Bausch, whom he succeeded as board chairman, having occurred in July at the age of 89. For 68 years, William Bausch had been with the firm and is credited with starting an optical glass plant here in 1915. He was active in the company's research laboratories until his unexpected death.

## Indian Film Executive Attends U. S. Parleys

Akbar Fazalbhoy, of Bombay, has been sent to the United States as a representative of the Indian motion picture industry's Postwar Reconstruction Committee to confer with film executives in America on future plans of the industry for India. In addition, he served as an advisor to the Indian delegation attending the International Business Conference, held at Rye, N. Y., in November where representatives of some 40 countries met to discuss postwar trade.

The Indian business leader is Managing Director of RCA's subsidiary company in India, RCA Photophone Equipments Ltd., of Bombay.

## DeVry Appoints Visual Aids Counselor

Miss Norma A. Barts, an authority on the classroom use of audio-visual teaching aids, has been appointed visual aids counselor for DeVry Corporation, Chicago. She will extend the work of DeVry's fast growing educational department and work in close association with DeVry's Educational Consultant, Charles R. Crakes. She will be available to school boards for audio-visual teaching aids demonstrations and for in-service training of classroom teachers.

Miss Barts is a graduate of the University of Illinois and has an M.A. degree from Northwestern University. She has traveled extensively and has done considerable research work in the field of audio-visual aids.

Leo J. Polubicki (1), E. S. Schweig (3), John Lang and Joseph Netzel (right) join in informal hand-shaking ceremony between Chief Naval Inspector T. W. Daniels (2), in charge of DeVry plants, and DeVry President, William C. DeVry, on the occasion of the raising to its company masthead of DeVry's fourth Army-Navy "E" Award for production excellence in the manufacture of motion picture sound equipment.

## Westinghouse Forms New Educational Department

Formation of a new Educational Department, co-ordinating all of the Company's relations with schools, colleges and universities, has been announced by Westinghouse Electric and Manufacturing Company. The new department, located in Pittsburgh, Pa., will have three main divisions. The first of these, School Service, provides teaching aids and science information to all schools and educational institutions up to and through the high school level. These aids, which include charts, posters, booklets, motion pictures and other materials, are prepared in collaboration with outstanding engineers and scientists of Westinghouse. Charles W. MacLean, present manager of School Service, will continue in that position.

A second division, University Relations, maintains close contact with colleges and universities, administers the Company's numerous scholarships and fellowships and supervises the recruiting of graduate student employes. Howard C. Madsen has been named manager of this division. The training of all graduate students for engineering, manufacturing, sales and other departments of the Company is supervised by the third division, Student Training. O. D. Montgomery has been appointed manager of this division.

In announcing formation of the new department, G. Edward Pendray, Assistant to President and director of Public Relations and Education of the Company, recalled that 61 scholarships totaling more than \$40,000 are offered annually by Westinghouse to the nation's high school seniors. These include 40 scholarships awarded each year in the Science Talent Search, a nation-wide competition sponsored jointly by Westinghouse and the Science Clubs of America.
